First Prize—Private Lockwood, 22d Regiment, New York—Remington Military Rifle.

Second Prize—Sergeant Alexander Roux, 22d Regiment, New York—Remington Military Rifle.

Third Prize—Lieut. J. S. Horsfall, 22d Regiment, New York—Remington Military Rifle.

Fourth Prize—Captain W. J. Harding, 22d Regiment—Remington Military Rifle.

Fifth Prize—Private Brill, 22d Regiment, New York—Remington Military Rifle.

Sixth Prize—Captain Head, 84th Regiment, New York—Remington Military Rifle.

Seventh Prize—Private J. S. Kellogg, 23d Regiment, Brooklyn.

Eighth Prize—Sergeant Brittenhousen, 32d Regiment, Brooklyn.

Ninth Prize—Sergeant Freeman, 23d Regiment, New York—Remington Military Rifle.

Tenth Prize—Private J. H. Sterns, 23d Regiment, New York—Remington Military Rifle.

Eleventh Prize—Private Otto Schneelock, 32d Regiment, Brooklyn—Remington Military Rifle.

Twelfth Prize—Sergeant Wagner, 22d Regiment, New York—Remington Military Rifle.

The team from the Twenty-second made the highest aggregate score, and out of the twelve prizes members of the Twenty-second won no less than seven prizes.

The following table will show the various regiments, number of men shooting, and the scores made:

Regiment.	Men	Score	Men	Score	Total
Twenty-second New York.....	12	136	11	127	263

FOURTH MATCH.

The target being the size of a man on a slab, six feet by two; distance, 100 yards; position, standing. The competitor making the greatest number of hits in one minute to be the winner. Open to all comers.

Drum-Major Gardner A. Strube, Twenty-second, 20 shots, 17 hits—Ward-Burton Rifle.

Lieut. Smoot, 19 shots, 17 hits—Remington rifle.

J. Bush, 15 shots, 12 hits—Remington rifle.

John Ryder, 14 shots, 11 hits—Remington rifle.

W. J. Carmichael, 22d Regiment, N. Y., 13 shots, 7 hits—Remington rifle.

Sergt. Kelly, Eng. Corps, 11 shots, 4 hits—Springfield rifle.

Sergt. Turner, Eng. Corps, 11 shots, 2 hits—Springfield rifle.

Average shooting of the Club, 1873, 2.534.

REMARKS IN REGARD TO THE FIRST MATCH.

It may be noticed that of 220 shots fired only six Bull's Eyes were made. The average of each shot was pretty nearly 1.95-1.10, not quite an outer. It compares quite favorably with the early matches at Wimbledon in 1860, at the same distance. The Wimbledon average for the Association cup in 1860 being 8.19, ours was 9.06. Of course there has been manifest improvement made in general scores at Wimbledon since that time. We produce the figures however as the only method of comparison we can find of the commencement of practical rifle shooting in America and England.

REMARKS ON THE SECOND MATCH.

In this score there is a manifest improvement. Eight bull's eyes were made, and the average was increased from 9.06 to 9.97, or almost ten. Each shot counted about 2½, or better than an outer. In the list of contestants may be seen the names of many members of the association, who have shown amazing progress since the first match.

To be Continued.

THE ZOOLOGICAL PARK.—One of the great features of our Fairmount Park during the Centennial will be the Zoological Garden. A large space has been given for this purpose, and advantage of the donation has been taken to make it worthy of the Centennial. Many specimens have already been forwarded to the gardens, among which are two San Salvador parrots, by Thomas Biddle, late minister to that place; a Mexican mustang dog, by Gen. Babcock; three monkeys—one of which was presented by Mrs. Megargee; two alligators, by George W. Childs; a pair of silver pheasants, by Theodore Harrison, also, an English pheasant, by the same person; raccoons, by Mrs. Fox, and numerous prairie dogs. The building for monkeys is forty-eight feet in length by thirty-four in width, and quite ornamental in appearance.—*Phila. Practical Farmer.*

MY FIRST DEER HUNT.

EDITOR FOREST AND STREAM:—

It was in the fall of the year, just as the last level rays of sunlight were creeping homeward over the pine tops, that I found myself rattling and jolting through the one street of a little Canadian hamlet, not a thousand miles from the city of Ottawa. There I remained for the space of about two weeks, gathering health and strength daily, and at the end of that time I decided that I was strong enough to go deer hunting.

My first move was to procure a pair of leather moccasins, or shoe packs, which were, I was informed, the very best things for traveling in the woods, and without which no one could hunt deer. The next operation was to obtain a conveyance to the house of a noted hunter, whom I will call Jim. At last the eventful day arrived. Coming to a place where the road made a long bend, Jim, who was leading the dogs, said he would cut across and meet George and myself at a point some distance ahead. He had been gone some five or ten minutes when suddenly the baying of a dog was heard from the direction he had gone. "He has let out Dick," said George; "Quick! Load up! We may have a shot." Our guns were quickly loaded and, leaving the horse standing in the road, we rushed forward to where George said the deer would cross. Upon arriving at the "runway" we found that both deer and dog had crossed the road, and George stooping down said that it was a doe.

"How do you know it is a doe?" I asked. "Did you see it?"

"If I had, I should have fired," he replied. "But, here! Look at this track! That is a doe!"

"Yes."

"Well! now look at this," pointing to an old impression on the snow. "Do you see any difference?"

"Well! one is round at the toe and the other is pointed. That is all I see."

"Exactly! A buck's track is rounded and a doe's is sharp at the toe, and you can tell a fawn by the size of the foot."

I still remember the admiration which I regarded this bit of woodcraft and the delight I took in putting it into practice on every successive occasion.

Jim soon came up, and the dog having lost the deer in the swamp and given up the chase, returning we once more set forth and soon arrived at the house where we were to stay all night.

Once fairly under way for the ground—George leading, myself next and Jim following, leading the dogs—I found it difficult to take it all as indifferently as the others seemed to do, and after Jim had left us at the edge of the woods bothered George with incessant inquiries about the chances of good sport, until he had to caution me to be quiet or I would "scare every deer in the woods." We soon reached the maple ridge where we were to watch the "runways," and in a few minutes after taking up our stations, one of the dogs gave tongue. A few moments of expectation passed and then I heard the report of George's gun. Pushing to the spot I found he had fired at a deer, and upon following the trail I found a fine doe lying dead about a quarter of a mile away. The fore feet were soon tied together and a thong fastened to them to be used in dragging the animal over the snow, which was accordingly done. That afternoon the hounds ran a buck which had only three legs, but he succeeded in getting to an open part of a stream and escaped by taking the water.

The next morning we took our stations on the same ridge as on the previous day and waited expectantly. A half an hour had perhaps elapsed when suddenly, without any previous warning, there rang out the sharp yelp of a dog within a hundred yards of where I stood. I knew from my experience of the day before that the yelping was a sign the dog was close upon the quarry, and I felt my heart beating like a small trip-hammer as I heard something bounding with long leaps up the bank. A pang of disappointment shot through me as I realised that the deer was not coming up my "runway;" but no time was allowed for its indulgence, for a magnificent doe bounded over the crest of the ridge about fifty yards away and disappeared behind a clump of hemlocks. Click! click! went the locks of my gun, and as she alighted after a leap, I fired. I saw the tail go down as I fired the left barrel; a sign, Jim had told me, of being struck; but I rapidly unslung my revolver and fired again as the deer halted under a tree. The heels were flung high in the air and the animal with one immense bound disappeared. "Lost," I thought, as I hastened over the trail, which was plainly visible on the snow. "No blood, I've missed it entirely," and I began to upbraid myself roundly for my wretched shooting, judge of my delight when I saw the object of all my hopes and fears lying a few yards from the spot where I had last fired at it, quite dead. I could contain myself no longer, and rent the air with such a series of whoops and yells as brought George running to see what was the matter. His astonishment on seeing the dead deer knew no bounds. He did not believe that such a youngster could have killed the first deer he had ever seen in the woods, and Jim coming up in a few minutes joined him in the belief, qualifying it, however, by the statement that as I had been "always kind o' scared o' missing," he thought I "might stand some chance."

George insisted upon my bleeding the animal, for he said it was "good luck," but no solicitations could induce me to do so; in fact as I stood there gazing at the shapely beast lying so lifeless upon the snow, I was almost sorry I had killed it. However, the deer was hung up on a sapling and we proceeded to a second ridge where Jim expected to have a good run.

We got one more deer that morning and then set our faces toward the house, where we arrived about one o'clock. After dinner we loaded our game upon the cart and set out for Jim's, arriving in time to prepare one of the deer for supper.

The next morning I left Jim's house for the village, and having been disappointed at not getting a buck among our deer, nailed a fine pair of antlers on the head of the largest doe before putting it on the sleigh. This proved a source of no small amusement, as many ejaculations of admiration were bestowed on the "fine buck" we carried—and the fifteen miles between Jim's and the village passed all too quickly.

Years have passed since then, and many times have I inhaled the balsamic air of the pine forests since I trod their depths in company with Jim, but never have their emerald reeds responded more sweetly to the wind or their balsams distilled a richer fragrance than on the day on which I killed my first deer. TRANSIT.

Woodland, Lawn and Garden.

WINDOW, OR PARLOR GARDENING.

INTRODUCTORY—CHAPTER NO. 1.

"Here stood a shattered archway, gay with flowers;
And here had fallen a great part of a tower,
While like a crag that tumbles from a cliff,
And high above a piece of turret stair,
Worn by the feet that now were silent—
Monstrous ivy stems clasped the gray walls."

IN one of his novels of life in our great cities, Charles Dickens graphically describes a narrow, dark street in London—a place where the bright and beautiful light of God's sunshine seldom penetrates the humidity of the London fogs. Dark, damp, and uninviting, indeed, is the locality. The poor—the very poor—dwell in this place, and in this very street hundreds of human beings are born, live, and die, and yet never leave their dismal abode—but seldom mix with any society save their own class. In this wretched locality, with all its squalidness, its misery and privations, there germinates the aspirations of a better, a higher, a more glorious life.

Stranger, let us pause before this old stone building. Behold how the green moss tenaciously clings to its window caps, its copings, and embrasures. Now cast your eye far up to those diamond-shaped windows. The windows are small, and a few hours' sunshine—from one to three hours perhaps in a week—illuminates the darkness of this "Coiner's Court,"* and yet see how beautifully those rose plants, the ivy, and carnations glow and bask in those few moments of sunshine. Are they not lovely? The signet of beauty is set upon the passiflora that with clinging tendrils finds security and sustenance in its quiet recess, from which it so gracefully depends.

From those silent, inanimate blossoms of earth we turn our eyes up to a second window, upon a level with the one we have contemplated, and here, too, under circumstances of still more abject poverty, a white arm extends in a broken teapot of earth a magnificent specimen of the geranium in full bloom. Setting it carefully upon a shelf outside the window, our fair owner carefully waters her pet plant, and after contemplating the same with evident pleasure (for said she to herself, "how beautiful God has made all things, even these flowers") she with a pleasant smile closed the window and disappeared.

How beautiful, how full of pleasure to our London maiden was her *one* solitary geranium. What a lesson of resignation, of quiet submission to outward circumstances, does she exhibit. Contented with her lot, she takes thankfully what the good God gives her with a gratefulness of heart. Well and truly could she appropriate to her own condition the lines—

"For though this cannot be our rest,
Life's roughest paths have still their flowers."

The least acute observer of Nature will find but few violets among the ruddy clover fields; neither do the harebells and heather grow amid the fogs of London city as they did in Shakspeare's time; yet here and there grows a plant that, "standing like Ruth among the golden corn," not only reconciles us to the destiny of our lives, but introduces to us from its humblest and most primitive state, its first rude attempt, the costly, well-stocked jardiniere, the pride and boast of Paris.

Passing from the first and most primitive form of "window gardening"—the solitary geranium in the hands of our London maid—we would endeavor to make the following papers both practical and interesting. At the period of our writing (1873) the subject of window and parlor gardening may truly be called one of the fine arts. Every one, to a certain extent, loves flowers, and many more would cultivate them in their rooms if they "knew how to do so successfully," said one of our lady friends, and she added, "Of what use is it to try to do what you do not how know to do? I readily admit it to be one of the most elegant, satisfactory, and refining pursuits that a lady can find for the development of a cultivated taste; but still, while I may love all the beautiful I behold in the wonderful sport of plant life, I lack the true knowledge of how to cultivate, how to produce these results."

This question, with your permission, we propose to answer. This information, plain, practical, and easily to be adopted to the various situations in which it is desirable to

grow plants, together with the plants best adapted to the different situations, will make the subject matter of two or three papers in the FOREST AND STREAM.

And first we shall speak of the simplicity of window gardening. From a very small beginning—some three or four plants only—how much pleasure may be received; how much real profitable instruction gained or imparted. If the one solitary shell on the sea shore is but the mute development of a great mystery, how much more so is that tiny, living, growing plant you hold in your hand? How great the mystery of its unfolding leaves; how grand the design as exhibited in the pushing of the leaves from even a bulb! As an evidence of its refining powers, one need not visit European cities and villages to see its effects upon the commonest peasantry.

In Paris, before the late war, might be seen the grandest developments of window gardening, elaborated and perfected in all its parts by this mercurial people. One would hardly expect to witness so intensified a love of flowers as is here daily exhibited. The flower girls of Paris make often not inconsiderable sums of money in a single season by the sale of the violet alone, which they cultivate themselves in their highest perfection in their window gardens, and in Paris it is not an uncommon thing to see as an appendage to the drawing-room of men of only ordinary means a collection of very rare and beautiful plants. Here in the windows of the parlors, shut off by an inside window, may be seen a miniature cascade of water flowing down over rockwork which is alive with the lycopodium, the ferns, and the cikas, all afforded at a very trifling expense. In some instances rare and picturesque developments, which belong rather to the out-of-door department of the landscape gardener, surprise and delight one in our window gardens. From the most simple, rustic, or plain crock beautiful flowers and star-like rays rise to cheer and gladden the chilly months of winter. From the more advanced and progressive works of the cultivation of the orchid, the crocus, the tulip, and oxalis of many kinds, our knowledge of the chemistry of the soils, and knowledge of how to produce these beautiful flowers with ease, give us a pleasant surprise. Said a lady, "Sir, I have raised very fine hyacinth flowers in the spring, the result of your teaching me to how to plant them in the fall." Now this all appears very simple; indeed, it is very easily done if a due regard to the details of the process be carefully observed. Growing flowers under difficulty is shown by the window garden process, and that, too, to great perfection in the dampest, dirtiest, and most smoky portions of all our great cities. We have numerous notes and observations under our hand, which we shall use in illustration of the feasibility of successful and also profitable window garden plant growing.

In our next we shall speak of the simpler forms of window, or box plant growing, and the few kinds best adapted for the amateur beginner to commence operations with.

OLLIPOD QUILL.

Natural History.

SALEM, Mass., Dec. 4, 1873.

EDITOR FOREST AND STREAM:—

I am gunning whenever work and weather will permit, mostly after shore-birds and sea-fowl, using heavy guns and a float, or as they call them south (in one instance, to my knowledge), "a mean Yankee sneak-box." During the past year I have taken several rare birds, and all within the County of Essex. They are as follows, according to Coues: The stilt sandpiper, quite rare; the buff-breasted do., very rare; the curlew sandpiper, very rare and accidental from Europe; the yellow rail, very rare; and also the mallard, the hooded merganser, and the cormorant, (*graculus carbo*). I think I am in luck, as they make valuable acquisitions to a collection which I have. I have also taken all of the curlews, but never one weighing $3\frac{1}{2}$ lbs., as C. B. writes from Mockhorn Island, Va. Tell him if he gets another *Jack Curlew* as large as that I'll mount it and return the same to him free of charge. I know that local terms confound sportsmen more than anything else, but the *Jack Curlew*, as I understand it, is the *numenius hudsonius* or *Hudsonian Curlew* of Dr. Coues, a bird somewhat larger than the "greater yellow legs," and I never saw a "sickle bill" which would weigh $3\frac{1}{2}$ lbs., and this bird is recognized by everyone whom I know as the largest of the three species of curlew found on our coast. Are "stiff tails" the "pin-tail duck? And what are "broad bills?" Hoping to hear from you through your paper as the happy medium of correcting wrong ideas in the minds of brother sportsmen,

I am, yours truly,

R. S. N.

DO SNAKES HISS?

EDITOR FOREST AND STREAM:—

I have read with interest the question which has been argued in your journal as to the habit of snakes swallowing their young, but although I have seen the operation twice, I did not care to mix in too rashly on the question, as I wished to find out if there were more than one or two varieties of snake that did this, for I do not think the habit is common; and a better reason for saying nothing about it was that I could give no information about what I had seen.

The first time that I saw it was in Warren County, N. Y. I was then a boy, and another boy who lived there said the snake was a viper. We saw the young ones run down her throat, killed and opened her and counted fifteen young

ones; but whether they were in her stomach or a pouch designated for such purpose, we did not observe.

The next and only time this subject ever came under my observation was when crawling ashore after an involuntary bath in the Grant River, Wis. I saw a snake swallow several young ones as they took alarm at my presence, but as my rifle was at the bottom of the river and my canoe just vanishing bottom up around a bend, it was not a favorable moment for careful investigation.

Having told what I don't know about one branch of ophiology, I could easily go on and show my ignorance of the entire subject, which I will admit; and so omit the proof.

I have made many experiments with snakes, both during and since boyhood, to see if it were possible to make them hiss. I began in faith, for I had so often read and heard of it; but a few failures begat a skepticism which has eventually ripened into unbelief.

I have tried them in many States of the Union, and have never yet heard a snake make a decided hiss, as a goose does. A snake looks as if it hissed when it threatens with its tongue, but such snakes, as it has been my fortune to meet, have all persistently refused to hiss at me. I do not wish to be understood as saying that an occasional experiment with snakes, common to New York, Mich., Minn., Ill., Wis., Iowa, and Kansas, has failed to prove it in my case.

The rattlesnake I have often tried, and when I pick up some story of wonderful adventure with them, where "the hissing was loud and terrific," I not only doubt the entire yarn, but set the writer down as deficient in woodcraft.

In Wisconsin there is a snake known as the bullsake, *Coleuber sayi*, which I was informed was a "hisser," so I captured one about five feet long and brought it six miles in a bag made out of my shirt and some cord. I put it in a box under the woodshed, being too tired to experiment that night, but the women made such a fuss about it that some one killed it—women are so "queer."

This was the only chance I ever had to try this variety of snake—and this one did not hiss when captured.

The belief that snakes do hiss seems to be so common that it seems as if there must be a foundation for it somewhere, though I have failed to find it. Perhaps I don't know how to make them do it; but I have poked, pinched and burned them, and hung them up and pinned them down, and if any of your readers will tell just what variety of snakes will hiss, and under what circumstances they do it, I will try and procure one and get some music out of him.

I never met any one who had experimented in this direction, nor saw any mention of it in any scientific work. I have only found a firm belief that they hiss, which like many other beliefs, is accepted because uncontradicted.

Having started this question, I expect to hear considerable said on it; and hope to learn something about it, for I am always open to conviction. FRED. MATHER.

The Kennel.

BREEDING DISTINCT SETTERS.—The most important point in crossing different breeds of sporting dogs is to pay attention to the qualities and education of their forefathers. We never advocate the crossing of pointers with fox-hounds, &c., so as to increase the strength and endurance of the animal. All dogs so bred will invariably give great trouble in their education, from an hereditary inclination to act the hound instead of the pointer. There is quite variety enough in the present breeds of pointers to improve your kennel if you want any addition of bone, speed, or courage. We saw a young pointer the other day, who was only just able to run out alone, point, and indeed back, as steadily and with as much certainty as an old dog, but this undoubtedly would not be the case had there being any cross whatever in his breeding. Always choose your crosses with dogs which show the strongest instinct, and whose ancestors have been remarkable for their scent on any given bird. For instance, select your puppies whose parents had shown most skill in trailing woodcock, or take a couple of setters, each having a wonderful reputation, excellent nose and strong scent for woodcock, breed them, and the first time you take the puppies out, you will find almost to a certainty when you see the little beauties working, that they are on a woodcock trail. Originate this breed as it were, and stick to it, and on no account whatever allow a strain of any other dog to mingle with the original breed. When the breeding in and in has arrived at the fourth generation, procure and select with great care another young setter, strong and unequalled scent, to breed from. By this you will then have bred as perfect a breed of woodcock setters as can be obtained in animal life. There is certainly no class of dog in which this faculty is more decidedly shown than in retrievers. Although a retriever is frequently of a cross-breed, yet, if his ancestors for one or two generations back have been well educated, and have had much practice in retrieving, he invariably requires little, if any, teaching, and appears to understand the whole of his business instinctively. The breeders and teachers of dogs would much facilitate their own labors did they pay more attention to the dispositions and habits of the parents of the puppies whom they take in hand. One or two brace of perfectly broken dogs, pointing and backing without fault, is a sight that must interest and amuse every person, whether sportsman or not; yet, we prefer hunting our own brace of dogs and seeing them look to ourself wholly for direction and approbation.

*Coiner's Court is a dark, damp, short street in London, inhabited on its lower floors by poor citizens, rag pickers, &c., while the more elevated rooms are occupied by seamstresses and shop girls, who, notwithstanding their poverty, still maintained a love of flowers and refinement.

INSTINCT IN A YOUNG POINTER.—In a late number of *Land and Water* the following appeared:

SIR: A correspondent of *FOREST AND STREAM* makes the above the subject of a long letter to that journal, and the incident detailed by him is certainly worth recording. A pointer pup, only four and a half months old, and belonging to the writer, was taken out by him in company with another dog, a staunch old animal of the same breed, to try for some quail. The idea being to associate the youngster as early as possible with his game, he was permitted, after having seen the old dog make two or three points, to approach the covey at which the latter had become cataleptic, and the admirable manner in which the young idea on this, his first introduction to game, behaved, is certainly a justification for the enthusiastic description of the event furnished by his master. He says when he got as close to the birds as prudence would allow, he stopped, but the pup trotted on quite unconcerned, when all at once he stopped, and slightly crouched, with his right fore-foot raised, "it goes down again, and now for a rush into the covey! No, he raises his left hind foot, which is instantly put down again, and the first position resumed, when he settles down to as steady a point as any bird-hunter wishes to see. A perfect picture—immovable, but quivering with excitement. All this was done without a single 'head' even." The puppy also stood to three more single birds during the evening, and the owner says that he never goes out without him. This circumstance is certainly a wonderful example of instinct, and although young highly-bred pointers and setters occasionally point game without previous training, I have never known or heard of them doing so at such a very early age; in fact, to me, a sober, steady-going English sportsman, who, however, have seen the performances of many first-class ones, the story seems almost incredible, and I should like to have the experience of some of your readers on the subject.—*COCKSHOT.*

We have written to our valued correspondent in regard to the facts, and have received from him every assurance of their reliability.

A sad accident occurred at Currituck last week, where Capt. George Gelston, Alfred Lockwood, Mr. Wade, late of Grinnell, Minturn & Co., Mr. Carrington, and others, were engaged in duck shooting, the gunner happening to blow off the top of his gunner's head by accident. The gunner was concealed in the long sedge-grass, and Mr. Carrington mistook his movements for a flock just rising. A coroner's inquest acquitted Mr. C. of evil intent.

HOW THEY TRAIN SHEEP DOGS IN CALIFORNIA.

C. E. Babb, in one of his letters from California, tells of what an old shepherd told him about the way they train the famous shepherd dogs in southern California. He says you may go over the plains and hills there for miles and see thousands of sheep, but not a man to watch them. Around each flock or band of say a thousand sheep are half a dozen dogs of a peculiar breed—dogs whose progenitors were imported from the sheep pastures of the old world. These dogs take the entire care of the sheep, drive them out to pasture in the morning, keep them from straying during the day, and bring them home at night. These dogs have inherited a talent for keeping sheep, but the shepherds do not depend wholly on that. They cultivate it in this way—so at least the old shepherd says: "When a lamb is born it is taken away from the mother sheep before she has seen it, and a puppy put in its place. The sheep suckles the puppy and learns to love it. When the puppy grows old enough to eat meat it is fed in the morning and sent out with the sheep. It stays with them because it is accustomed to be with its mother, but it cannot feed with them. As they get full the dog gets hungry. At length, impatient to return where it hopes to get another piece of meat, it begins to tease and worry its mother, and finally starts her toward home; the other sheep follow, and thus the whole flock is brought in. If the dog brings the sheep home too soon, or comes home without them, he gets no supper or is punished in some other way. Hence he soon learns when to come, and to see that none of his charge are left behind. These animals are trained by taking advantage of their instincts and appetites."

The Horse and the Course.

The meeting of the Board of Appeals of the National Association for the Promotion of the Interests of the American Trotting Turf was begun yesterday at the Everett House in this city. The meeting attracted a large attendance. The old docket consists of five cases, and the new one of thirty-four.

GENTLEMEN RIDERS WHO CAN'T RIDE.

"I KNOW many who dress in the brightest of scarlet and best of buckskin smalls, who never saw a fox killed by hounds in their lives. There are hundreds of clever hunters completely spoiled by bad riders, who have neither hands to handle them nor seats to sit on them. But it is not policy on the part of the dealers to have lawsuits with gentlemen, for there is an unjust prejudice against horse dealers in general, although those who are 'licensed dealers' are as honest in their business transactions as any other class of tradesmen, and I have known many of them to take back horses and return the money to purchasers when the horse has been absolutely spoiled in mouth, temper, and condition, sooner than have a dispute or law-suit."

"A friend of mine, who is a large breeder, sold a horse as a clever fencer to a gentleman a short time ago. He returned him in the course of a few days, stating that he could not make him jump. I rode and subjected him to a trial a few days after, and can conscientiously affirm that a sweeter jumper never carried me over a fence, and I have ridden as many horses as most men. I know the gentleman who sent him back must have had either hands nor seat, for as I pulled him gently together, and felt his beautiful mouth, with the single snaffle bridle, he answered to the easy appeal of my hands and bowed his smart intelligent head, as much as to say, 'I'm at your service, sir,' and walked (as only a temperate, well broken horse can walk) quietly, with a long steady, business-like stride; and

as the trial ground is interspersed with every description of fence, after having satisfactorily tested his walking qualities, I gave him his head, and as the splendid creature bounded over the springing turf toward the first brushwood fence, there was no rushing or turning his head to the right or left for a bolt, as he seemed to say by his actions 'Give me my head, and sit me steady,' and 'forward is my motto.' Yes; my beauty! thought I, you shall have your head, for how can you jump unless you have it? Still I'll keep a steady supporting feel on your mouth. Now for it—one of your ears is pointed forward, and now the other, in rapid succession; the rein tightens. Steady, boy! He over, my fawn! There! Why I never felt you drop, for it is the strength and elasticity of your pasterns which enable you to bound from the turf again."

"And now we come to these swamps, the sod-banks, and stone walls. There, my boy, that is it; measure your ground, and go a little nearer this time before you take off, because the leaps are higher. He over again, my charmer! bang go your heels against the other side of the stiff sod bank, with a sound like the thud of a cannon ball when it strikes an earthwork as you drop your fore-feet neatly and firmly on the turf; a second after and your hind shoes kiss the ground, and at the same instant your fore-legs are stretched out for the first of a series of delightful bounds over this wide sweeping meadow, after which you shall charge that stone wall which lies right in your front. Here it is my boy; a trifle higher than the sod bank; but you have measured it by your eyes—I can tell by the working of your beautiful ears. Hoo-roo! Oh, how I like you! Now for the water jump at the bottom of this gentle slope. Whew? you bird on the wing! I never felt you fly over this, but I can feel you galloping as strong as a castle under me. I glance my eye down your fore-arm, as you bend your well formed neck and head, which playfully answers to the gentle supporting feel of my hands, and I can perceive the prominent muscles of your fore-arm stand out, and you are neither blowing nor sweating: your eye is as bright as a diamond, and your coat shines like a mirror, your condition is perfect, and it is a pleasure to ride you, because I know that I am not distressing you. But here we are at this side of the stiff blackthorn bullfinch, higher than yourself, with not a ray of daylight to be seen through it. Your ears play and your head nods, and again I know that you will top it. 'Yoi-over!' I say as you leave the ground, and suspend me and yourself—with your four legs clapped under your belly—in mid-air for an instant, and drop them, feet downward, with a regular flop on the other side: but the superiority of your condition, the strength of bone and muscle, and the dash of pure blood which courses through your prominent veins, stands to you in this your time of need, for the stiff dirt is rent to atoms and flies about in all directions, as you gallop through the long ploughed field to the most difficult jump in the lot, a double post and rail."

"Can you do it? Yes; I feel your body working under me; you are preparing for business, I know; but remember it is double, and I must give you a reminder—a sharp clip with the inside of the legs, but no rowel; a slight shake of the reins, just to let you know that a little extra energy is required—and will you answer to these signals? Yes, hie, over, my jewel! we are safe in our places on the other side; a rolling seat would make any hands unsteady, and a job of the spur at the same instant would have soured your temper, and totally destroyed the cordial feeling between us, which has enabled us to surmount every obstacle; for the rolling, unsteady seat is sure to be allied to a pair of heavy, harassing hands, and frequent misapplications of the spur would spoil even you, who are as good a jumper as ever stood on iron."

"These were my thoughts as I rode and dismounted this noble creature, which the gentleman had sent back to the breeder because, he said, that he could not, or would not jump, the simple reason being that he had neither nerve nor skill to manage him."

"A fine mannered horse, isn't he?" said my friend, as the lad led him back to his box, without a twisted hair on his shining skin."

"Very, indeed," I replied; "but deep-levered bits and tight curbs, handled by inexperienced riders, will spoil any horse in the world." And in this case it was fortunate the gentleman returned the horse so soon after sale, for a few more days' mauling him about would have completely ruined him, and he would have been returned without a shilling of compensation. However, a little quiet handling brought him back to his old form."

The Magazines.

MAN'S ABILITY TO MODERATE CLIMATE.

ALTHOUGH extended observation and systematic arrangement of natural phenomena have of late years supplied the data for great advance in meteorological science, the measure of man's ability to moderate climate, and to what extent such modifications will influence the mental, moral, and physical condition of their originator, will perhaps forever remain questions for further investigation and continued dispute. Nevertheless, there now remains little doubt but that man may, and does, in a great degree, mould the apparently natural surroundings of his home. He is the great disturber of natural laws; for, although the individual human may bear as small a proportion to the ends attained as the microscopic polyp to the coral formations of the ocean, yet, as many generations of these countless little beings have built up such monuments, so have the off-succeeding generations of man gradually wrought changes upon the face of Nature, proportionately marked and important. Unfortunately, the preponderance of influence exerted by him has had the effect of destroying in a measure the pristine balance of physical nature; for he has found it in this case more profitable and less laborious to tear down than to rebuild her essential monuments.

Thus, no great difficulty is encountered in changing a moist atmosphere to one of less humidity—the clearing of forests and draining of lands effect this, under certain conditions—and an acknowledged advantage is immediately derived; but when the other extreme is approached, far greater obstacles are encountered in checking the ebbing flow of Nature's current, and restoring the balance, while the benefits accruing therefrom are long deferred.

Vast areas of the earth's surface have been stripped of the natural forest clothing through the medium of the axe and fire-brand in the hands of man, who, thus removing a

most potent element in the problems of evaporation and precipitation, has caused great irregularity in the rainfall of these districts, resulting in alternate drought and flood, and the formation of arid deserts or denuded wastes of the primitive rock. Our earth is not becoming ameliorated and better fitted for the habitation of the human race, except in so far as that race directly undertakes works of improvement with a view to such amelioration. The more direct wants of man are supplied by the most direct tax upon Nature; and, unless there be some compensation and systematic effort made to restore her disturbed harmonies, there is a constant balance of drain upon her resources and increased disturbance of her laws.—*Overland Monthly.*

—THE PRAYER OF AGASSIZ.—Professor Agassiz at the opening of the Anderson School of Natural History, after a few modest words, felicitously suited to put all their minds into fellowship, said tenderly and with touching frankness, "I think we have need of help. I do not feel that I can call on any one here to ask a blessing for us. I know I would not have anybody pray for us at this moment. I ask you for a moment to pray for yourselves." Upon this the great scientist—in an age in which so many other great scientists have concluded that praying is quite an unscientific and very useless proceeding—bowed his head reverently; his pupils and friends did the same; there in silence that was very beautiful, each spirit was free to crave of the Great Spirit the blessing that was needed. For our own part, it seems to us that this scene of Agassiz and his pupils with head bowed in silent prayer for the blessing of the God of Nature to be given to that school then opened for the study of Nature, is a spectacle for some great artist to spread out worthily upon canvas, and to be kept alive in the memory of mankind. What are coronations, royal pageants, the parade of armies, to a scene like this? It heralds the coming of the new heavens and the new earth, the golden age when Nature and man shall be reconciled, and the conquests of truth shall supercede the conquests of brute force.—*Rev. Dr. Deems, in Christian Age.*

—The largest sheep raisers in North America are Armigo & Baca, of Albuquerque, New Mexico. Their herds range over 300 miles of territory, and in numbers almost beyond human count, exceeding half a million at least. They are usually divided into herds of 3,000, superintended by one manager and several shepherds and dogs, for whom the sheep manifest a great affection.

Answers To Correspondents.

[We shall endeavor in this department to impart and hope to receive such information as may be of service to amateur and professional sportsmen. We will cheerfully answer all reasonable questions that fall within the scope of this paper, designating localities for good hunting, fishing, and trapping, and giving advice and instructions as to outfits, implements, routes, distances, seasons, expenses, remedies, traps, species governing rules, etc. All branches of the sportsman's craft will receive attention. Anonymous communications not noticed.]

A CONSTANT READER., COTY, Penn.—Drachms of powder are measured by Dry Measure.

G. N. W., St. John, N. B.—Your several favors are received and will receive early attention. Thanks.

PEANUS, Hudson, N. Y.—Black setters are very rare, and one of the worst colors to shoot over. We will ascertain for you if there are any for sale.

L. M. S. Stoystown P. O., Penn.—We cannot procure the moccasins; any country bootmaker will make them according to instructions in *FOREST AND STREAM* Nov. 20th.

JOSLYN, Hartford.—The best boatman in the vicinity of Enterprise, Florida, a year ago, was a negro called "July"—possibly so named because he was a handy fellow to have about one in mid-winter.

G. W. R., Brooklyn.—1. Bore, 45-100. 2. Decoys are useful when the birds are scarce and wild. A good "caller" is essential. They shoot generally from points.

QUERIST.—Stiff tail ducks are known as pintails, spring tails, file-stalks, &c. The greater black-head duck is known as the broad bill, scaup, &c.

TRUE SPORTSMAN, Madison, Wis.—What great sporting writer signed his name Nimrod? Ans. C. J. Apperley, Esq. He died at the age of 64 in London, England.

ANTLERS, Kingston, N. Y.—Deer will eat almost everything. We have frequently fed them with ham, meat, sugar, gloves, newspaper, and even cinders, just to see what they will refuse.

FOX HOUND, Lexington, Ky.—The system in feeding a hound which we have always endeavored to pursue, was to make him fit for the day and that day alone, and so on every day he came out.

L. W. L., Cazenovia.—Costs \$36; globe and peep sights \$5 extra; set trigger, \$2 50 extra. This is for 30-inch barrel. \$1 more per inch if longer, and \$1 less if shorter. Extreme length, 34 in., minimum, 26; weight, 10 a 12 lbs.

DR. G., Baltimore.—Cut down your gun by all means, if you require it for shooting over a dog. If for wild fowl shooting, let it remain as it is. The only seam in a shooting boot should run down the centre of the boot. Read *FOREST AND STREAM* Nov. 20th., article headed "Moccasins."

J. DELCISUR, New York.—I have a very valuable dog. Do you know a remedy for canker in the ear? Ans. To cure it, if he is in fair health, first bleed, keep him cool and low, and inject an astringent wash, composed of six ounces of rain water and as much alum as will dissolve; add twenty grains of white vitriol, and inject with a small syringe.

SUBSCRIBER, Cor. Second and Poplar streets, St. Louis.—We know of a brace of setter pups eight months old good strain, handsome, and the color orange and white. Price 50. A brace of setter dogs two years old, good strain and well broken on the silent system, will cost \$175. If you require either you can write and we will give full particulars.

CHASSEUR.—We cannot tell who makes the best breech-loader, there are so many. State what price you are willing to give, and we can put you in the way of getting a good and serviceable gun. Our agent in London, England, will procure them for you. An English pointer of the class you speak of will cost \$150, including all expenses of transportation, board, care, etc. The setter very little less.

POWDER PACK.—1. Should the paper shell fit tight or loose? Answer. Tight of course. 2. Which is the finest grain, No. 5 or 7 of Orange Lightning powder? Answer. No. 5. 3. What grain of Hazard powder is the size of Tatham's No. 8 shot? Ans. It would be impossible to tell the exact size of powder on account of the difference in shape. It is somewhere between 5 and 6 grains. 4. Which is best for a paper shell, felt or pink-edged wad? Ans. For ordinary shooting the pink-edged wad.

RAMON.—1. Get guides for Conlogne district, Canada, at Ottawa City or Annaprior. 2. Charges for guide, \$1 per day and found. 3. Bear, beaver, fox, marten, otter, sable and lucifer. 4. Newhouse's traps, made at Oneida, N. Y., are the best by long odds. 5. About the same all through the counties of Pontiac and Ottawa, Province of Quebec. See articles in this day's *FOREST AND STREAM*, on "Trapping" and "Winter Sports in Canada." See also our standing rule above, respecting anonymous inquiries.

—The difference between an old hat on a stick and money with a spendthrift is that one scares crows and the other grows scarce.

A WEEKLY JOURNAL,
DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY,
FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS,
AND THE INSTRUCTION IN MEN AND WOMEN OF A HEALTHY INTEREST
IN OUT-DOOR RECREATION AND STUDY.

PUBLISHED BY
Forest and Stream Publishing Company,

103 FULTON STREET, NEW YORK.

Terms, Five Dollars a Year, Strictly in Advance.

A discount of twenty per cent. for five copies and upwards. Any person sending us one subscription and Five Dollars will receive a copy of Hallock's "FISHING TOURIST," postage free.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices, 50 cents per line. Advertisements in double column 25 per cent. extra. Where advertisements are inserted over 1 month, a discount of 10 per cent. will be made; over three months, 20 per cent; over six months, 30 per cent.

NEW YORK, THURSDAY, DEC. 11, 1873.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal letters only, to the Manager.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited. We cannot promise to return rejected manuscripts.

Ladies are especially invited to use our columns, which will be prepared with careful reference to their perusal and instruction.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.
CHARLES HALLOCK,
Managing Editor.

THE IRISH RIFLE CHALLENGE.

THE annual meeting of the Amateur Rifle Club was held on Friday last, December 5th, at the 7th Regiment Armory. The following officers were elected for the coming year:—President, Captain G. W. Wingate; Vice-President, Colonel H. A. Gildersleeve; and Secretary and Treasurer, F. P. Fairbanks, Esq. The Executive Committee are as follows:—Messrs. H. Fulton, J. T. B. Collins, A. Alford, L. C. Bruce, and G. S. Schermerhorn. An important subject taken up by the A. R. C., was that of the

IRISH CHALLENGE.

On motion of Mr. J. P. M. Richards, the following resolution was offered:—

"That the Executive Committee of this Club be hereby requested to correspond with Mr. Leech, and if satisfactory terms can be arranged to accept the challenge in the name of the Amateur Rifle Club of the city of New York, and of the Riflemen of America. And it is hereby arranged that an opportunity be offered to the Riflemen of the United States at the earliest possible date to compete with our own practice squad for places in the team, but without expense to the Club," which resolution was passed unanimously. The meeting was attended by the most prominent shots of the Amateur Rifle Club and National Rifle Association, who were strongly in favor of accepting the challenge of the Irish team. It will be seen that the Club do not propose to accept the challenge so much for themselves as on behalf of the American Riflemen. It is hoped that those who consider themselves qualified to compete in such a contest, will, in case a definite arrangement is made, place themselves in communication with the officers of the Club. Those intending to do so; however, must bear in mind that they will be restricted to the use of a rifle weighing less than 10 lbs. with a trigger pull of 3 lbs. at least, and without telescopic sights.

The Amateur Club is an Association of gentlemen.

The total scores and averages made by the A. R. C., this season, will be found in another column.

—At a recent meeting of the Belgian Academy of Sciences rather a curious discussion took place. M. E. Van Beneden, the well known Zoological Professor of Louvain, read a paper on Brazil and the La Plata. Speaking of the difficulty of obtaining a dolphin, on account of the superstition of the Brazilian fishermen, the Professor referring to the ancient European belief that dolphins were in the habit of bringing dead bodies on shore, said "the fable of Jonah is an embodiment of this belief." As all questions referring to religious subjects are not allowed to enter into these scientific discussions, M. Van Beneden was quickly called to order and his expression particularly in regard to Jonah's dolphin, was very properly withdrawn.

THE MICHIGAN GRAYLING.

LAST winter, about twelve months ago, the editor of this paper interested himself greatly in aiding to identify this valuable game-fish, and in procuring specimens for scientific examination by Professors Agassiz, Baird, and Cope, at their respective museums at Cambridge, Washington, and Philadelphia. By the persistent efforts of Mr. Fitzhugh, of Bay City, Michigan, male and female specimens were procured by Indians who traveled 150 miles in dead of winter to spear them through the ice, and were forwarded to us at our expense, and by us distributed. Some mention was made of the fact at the time, and an opinion and classification was printed in the New York Times, over Prof. Agassiz's signature. However, experts had examined the subject but little, and to this day nothing more definite has been printed. Our readers will therefore be able to estimate our satisfaction in being able to lay before them the exhaustive paper herewith appended from Prof. James W. Milner, assistant United States Fish Commissioner, and dated—

SMITHSONIAN INSTITUTION, December 4, 1873.

In the centre of the lower peninsula of Michigan, is a wide, elevated plateau, a sand region, with a soil containing a very small per cent. of organic matter, and covered with a forest of pines, generally the Norway pine, *Pinus resinosa*, Linn, growing in grand dimensions, the long, limbless shafts making wide boards, free from knots, yet but little utilized, while immense forests of the favorite lumber material, the white pine (*Pinus strobus*) are yet uncut. From this plateau arise several large streams and rivers, flowing each way, into Lakes Huron and Michigan. Among these, are three rivers of note, the Muskegon, the Manistee, emptying into Lake Michigan, and the Ausable, emptying into Lake Huron. Among the minor streams are the Cheboygan, Thunder Bay, and Rifle, tributary to Lake Huron, and the Jordan, emptying through Pine Lake into the Traverse Bays of Lake Michigan. A few branches and streams, spring fed, are formed, in which the water has a uniform degree of coldness throughout the summer, seldom rising above 52°. The rivers Rifle, Ausable, Jordan, Hersey, branch of the Muskegon, and the headwaters of the Manistee, all have this character, and in all of these, and only in this limited locality, short of the Yellowstone region, is found the already famous Michigan Grayling, *Thymallus tricolor*, Cope.

In September last, provided with boats and fishing tackle, an excursion was made by a party of four, including guides, to the headwaters of the Ausable for the grayling. D. H. Fitzhugh, of Bay City, Michigan, who has already made known more facts in reference to the habits of this species than any one else, was of the party.

Leaving Bay City we traveled northward by the new extension of the Jackson, Lansing, and Saginaw Railroad to the last but one stopping places short of "the end of the iron."

In these days of extensive pioneering and wholesale exploration, the man is favored who finds himself in the midst of a really untrodden wild. The character of the land and the timber in this locality have little attractions for the seeker after productive soil or investment, and the sportsman and the naturalist find here a patch of nature left in almost primeval purity. As we embarked in our light boats, in the early morning, and our bows broke the trailing mist that covered the river, it was as if brushing the fresh bloom from newly plucked fruit, so untouched by the hand of man did everything seem.

Quietly the guides poled the boats down the rapid current, while we adjusted rods, lines, and leaders, using, in accordance with Mr. Fitzhugh's former experiences, a lead colored, a brown and a black hackle.

Several favorable spots were tried before a fish was struck; he was small and played weakly, but on landing him, he proved to be a genuine specimen of the desired fish, having, as afterwards proved to be the case, slightly less brilliancy of color, and more of the black salmon spots, than the mature specimens. Before we reached the site chosen for our camp, seven of the graceful creatures were swimming in the well of one boat, and four in the other. They had given evidence of their game qualities to some extent, but fought with less vigor in the cold water of the early morning than they did later in the day.

The camp stores were put on shore, and we began the work of the day in earnest. Dropping the flies at just the spots where trout would be sought for, finds the grayling similarly located. As Sir Humphrey Davy says of the English species, (*Salmonia*, 4th ed., 1851, p. 180.) "He rises rapidly from the bottom or middle of the water, darting upwards, and having seized his fly, returns to his station." Hooking a large one, we had good evidences of his plucky qualities; the pliant rod bent as he struggled against the line, curling his body around columns of water that failed to sustain his grasp, and setting his great dorsal fin like an oar backing water, while we cautiously worked him in, his tender mouth requiring rather more careful handling than would be necessary for a trout; making aspart up stream, he requires a yielding line, but after a time he submits to be brought in, rallying for a dart under the boat, or beneath a log, as an attempt is made to place the landing net under him. Finally brought on board, exhausted, he is easily removed from the hook and slipped through the hole in the cover of the well.

Nine were taken from a deep hole under projecting willow bushes; several times two were taken at once, and Mr. Fitzhugh, by skillful management landed three from one fortunate cast. They are free, strong biters, and cannot be considered very shy, as they will rise repeatedly to a fly if

a failure is made in hooking them. Still an experience on the Jordan in 1871 proved that it sometimes required all the ingenuity of an experienced fly fisherman to induce an occasional rise, when grayling were seen to be plentiful in the river, and there is a tradition in the city of Bay City that three unfortunate fishers came into town on one occasion, asseverating that the claim that grayling existed in the Ausable had been proven a fraud.

The first day's efforts resulted in seventy-two of the fishes, and grayling was served up at night for supper by the camp-fire, and proved a fair rival for their congener, even upon the table.

The second day it was agreed that Mr. Fitzhugh should explore the stream for five miles down the river, while our boat worked up and down each way from camp, over about three or four miles. The day's fishing added to the score, until all told there were one hundred and forty-three specimens, from five inches in length to those weighing one and one half pounds. The lower part of Mr. Fitzhugh's exploration of the river proving barren, there was a smaller number to carry away than might have been obtained, as he was the most successful, being much more experienced as a fly fisherman.

There is no species sought for by anglers that surpasses the grayling in beauty. They are more elegantly formed and more graceful than the trout, and their great dorsal fin is a superb mark of beauty. When the well-lids were lifted, and the sun's rays admitted, lighting up the delicate olive-brown tints of the back and sides, the bluish-white of the abdomen, and the mingling of tints of rose, pale blue, and purplish-pink on the fins, it displayed a combination of living colors that is equalled by no fish outside of the tropics.

The history of the discovery of the species is as follows: It has been known for years to the people in adjacent countries, and among the lumbermen, and generally called trout, distinguishing it from the ordinary species by applying the local name of the stream, as the "Hersey trout," or the "Jordan," or "Ausable" trout.

In the winter of 1864 and 1865, Prof. Edward D. Cope, of the Philadelphia Academy of Sciences, worked up a large collection of fishes, sent by Mr. M. Miles, of Lansing, belonging to educational institutions of the State of Michigan. Among these he found this species, readily detecting its relation to the genus *Thymallus*, and giving it the name of *tricolor*. In the winter of 1872, Mr. D. Fitzhugh procured specimens and forwarded them to Professor Baird of the Smithsonian Institution, and to Professor Agassiz, as well as to prominent authorities of the hook and line profession. These were the first specimens obtained by the museums, and were regarded with a great deal of interest. Two obtained for the U. S. Commission of Fisheries in 1871, from the Jordan river were lost in the great fire at Chicago. Mr. Fitzhugh subsequently went before the legislature of his State and induced the passage of a law protecting the grayling from a too rapid destruction. He was also the first to communicate with reference to their habits and qualities as a game fish.

This grayling, Professor Cope has decided to be distinct from Sir John Richardson's species, *Thymallus signifer*, of the far north, the specific name of which, (*signifer*, "the standard bearer"), refers to its large, brightly colored dorsal fin. It is the only other species known on this continent. Richardson gives its range, as north of latitude 62°, between the Welcome River and the Mackenzie, flowing into the Arctic Sea. In reference to its habits, he says it is "found only in clear waters, in the most rapid parts of the mountain streams." Describing its capture with the fly, he says:—"The sport was excellent, for this grayling generally springs entirely out of the water when first struck with the hook, and tugs strongly at the line, requiring as much dexterity to land it safely as would secure a trout of six times the size." The species has been found in the Yukon River, of Alaska, so that it will be seen to be one of our possessions.

A specimen of the grayling, forwarded to Cuvier about 1847 or 1848, purported to have come from Lake Ontario, and was named by him *Thymallus ontarianus*, but the locality must have been a mistake.

The foreign species of the genus are also limited. The *Thymallus vulgaris*, Nilsson, is the one found in England and northern Europe, and according to Dr. Günther, an authority on the foreign salmonidæ, the same species inhabits central Europe. Professor Agassiz, supported by one or two prominent French and German ichthyologists, does not believe the two species to be identical, and has named the one last referred to, *Thymallus veillifer*. We learn from Walton * in his very interesting reference to the grayling, of the local habits of the English species, and this is corroborated in more detail by Ephemer, † (E. Fitzgibbon), and Sir Humphrey Davy. ‡

Our species, *T. tricolor*, Cope, evidently has the same habit, as this region of Michigan is its only locality, east of the Mississippi.

In Professor F. V. Hayden's expedition to Montana in 1871, specimens of the same species were found in Yellow Creek, and the Gallatin Fork of the Missouri.

The other foreign species are the *Thymallus gymnogaster*, Cuv. & Val., of the Newa, at St. Petersburg, Russia; the *T. Aeliani*, Cuv. & Val., from Lago Maggiore of Italy and Switzerland; and the *T. Pallasi*, Cuv. & Val., found by the old naturalist, Pallas, in the Kolyma and Sob Rivers, emptying into the Arctic Ocean in western Siberia.

The protection and increase of the Michigan species is a matter of interest to every one. It will probably be found

* The Complete Angler. Ephemer's ed., p101, p104.

† Salmonia, p189.

to have the same habit as its European relative, and spawn in the spring. It is adapted, like all the Salmonoids, to artificial culture, the ova according to Frank Buckland, hatching in spring water at the ordinary temperature, in about fourteen days after impregnation.

THE URARI POISON.

THE attention of the readers of FOREST AND STREAM has lately been called to this interesting subject, and a few additional remarks may not be out of place. By way of preface it may be said that Doctor Saffray, in the article in *Le Tour du Monde*, does not state that the Urari poison is prepared from the venom of a toad, though this might fairly be inferred by the reader; he says that the arrows of the Choco Indians of New Granada are armed with "a substance similar to curare" and like it in its effects, while it is undoubtedly true, as stated by St. George Mivart, that the ability to inflict wounds and to convey venom is not found in any animals which are even near allies of the frogs and toads; it is also true that the viscous secretion, which exudes so copiously from the pores of these animals, is very acrid and even poisonous. These clumsy and otherwise unprotected creatures are thus provided with a very effectual means of defense, as will be acknowledged by every one who has seen a dog trying to take a toad in his mouth. It is commonly said that handling a toad will produce warts; of course this is very ridiculous, but like most popular beliefs it is not without foundation. The writer knows from experience that the exudation from a common toad is painful if it touches a cut finger. There are cases on record where serious results have attended the introduction of this substance into the blood and there appears to be no adequate reason for doubting the statements of Doctor Saffray regarding the use of the secretion of *Phyllobates melanorhynchus* as arrow poison.

The Urari poison is obtained from a very different source, being prepared from the bark of a woody vine or liana, growing in the Guianas and the valley of the Amazons. This vine, the *Strychnos toxifera*, is closely related to the plants from which are prepared the well-known drugs Strychnine, Nux Vomica and Brucia. The arrow poison, though the deadliest of known blood poisons, may be swallowed without serious inconvenience, thus resembling the animal rather than the vegetable poisons. Hence it was for a long time supposed that it derived its properties from the serpent venom and the stinging ants, used by the Indians in compounding it. Sir Richard Schomburgk prepared it by concentrating an infusion of the bark collected in his presence, thus proving beyond a doubt its true origin; the poison thus prepared, though not sufficiently concentrated, killed a fowl in twenty-seven minutes.

The peculiar properties of the Urari poison are due to the presence of the Alkaloid Urari nor Curarin, discovered by Boussignault in 1828, but first produced in a pure crystallized state by Dr. Preyer of Bonn in 1865. Many eminent physiologists have studied its effects but their experiments have not yet dispelled the mystery which has always attended it. It appears to act upon the muscles, causing death by paralyzing the heart or the muscles of respiration. Animals on receiving it into their blood soon fall in a stupor, the pulse becomes strong and rapid, the breath hard and accelerated, the muscles after a convulsive motion are paralysed, the body becomes cold and death ensues in five to thirty minutes according to the size of the animal and the strength of the poison.

According to the experiments of M. Goudot birds seem most susceptible to its effects, then mammals, then reptiles. The experiments of Prof. Wm. North Rice, made in connection with last summer's work of the U. S. Fish Commission, show that mollusks are not in the least affected by it.

Urari has been employed in medicine as a specific for epilepsy, but the success of the experiments was not such as to recommend its general use. We have frequently seen it used to paralyze a frog, preparatory to placing it under the lecturer's microscope to demonstrate the circulation of the blood.

The Indian arrow poison is known by various names; that prepared on the Orinoco as Urari or Curari, that from the Guianas as Urali, that from the Amazons as Ticunas. The usage of different writers and the interchange of *r* and *l*, practised by the South American Indians have given rise to multitudinous variations, such as Urari, Woorari, Woorara, Oorara, Urali Wourali, Ulari, Curare, Curari, and Voorari. Some fixed orthography seems eminently desirable, and Urari seems to have the sanction of the best authorities.

Below is given an account of the mode of preparation in the words of Charles Waterton, who early in the present century made a long and perilous journey into the interior of Guiana, expressly to collect the poison. Those who are interested in a fuller account of the poison, its use and its effects should not fail to read that most fascinating of all books of travel "Waterton's Wanderings in South America."

"When the Macoushi Indian prepares his poison, he scrapes the Wourali Vine, and a bitter root into their shavings, and puts them into a kind of colander made of leaves; this he holds over an earthen pot, and pours water on the shavings; the liquor which comes through has the appearance of coffee. When a sufficient quantity has been procured the shavings are thrown aside. He then bruises some bulbous stalks which he has gathered, and squeezes a proportionate quantity of their juice through his hands into the pot. Then the pounded fangs of the Labarri and the Counacouchi snakes are added, a quantity of the strongest

Indian pepper and of two species of ants are thrown into it. It is then placed on a slow fire, and as it boils more of the juice of the Wourali is added, according as it may be found necessary, and the scum is taken off with a leaf; it remains on the fire till reduced to a thick syrup of a deep brown color. As soon as it has arrived at this state a few arrows are poisoned with it, to try its strength. If it answers the expectations, it is poured out into a calabash, or little pot of Indian manufacture, which is carefully covered with a couple of leaves, and over them a piece of deer's skin, tied round with a cord. They keep it in the most dry part of the hut; and from time to time suspend it over the fire to counteract the effects of dampness."

It is interesting to know that some of the identical poison collected by Waterton in Guiana in 1813 was in existence in London in good condition in 1864.

A SOLOMON OF AN ARCHITECT.

ELEVATIONS, plans, working details, estimates, and contracts, as furnished by our most experienced architects have their numerous drawbacks. We suppose there never was a human being born who did not indulge in some preconceived notions, as to how he would like his own particular nest to be built, which ambitious fancies are invariably met by the builder with scorn—nay almost with derision. "You want," says the architect, "a Gothic Villa? good. Now the idea of your having an airy room in your third story, with seventeen windows is impossible. The style of architecture is against it, and my reputation would not allow of it. The canons of my art say six windows, neither more nor less. If you like, for it is perfectly indifferent to me, take a Renaissance style of building, and I may possibly, after I have studied it, approximate my plans to your somewhat crude ideas. "But," you ask somewhat abashed, "Are considerations of health secondary to the exigencies of Gothic art?"

"They are sir, and that conviction has long been forced on me, by the sublimity of my profession," replies the architect.

Happy dwellers of the Solomon Islands, whose country washed by the broad Pacific, ignores the architect, and which if thwarted by one, might knock him in the head, next roast him with his drawings, ground plans, and sketches, and lastly devour him. In those fortunate isles, the intelligent people, (each one as the Hebrew King Solomon, from whence the name of the country was undoubtedly derived), select a tall tree for a building site. The higher the tree, the more money does it command, in the Solomon Islands real estate market. The most desirable family location, must be at least one hundred and twenty feet from the ground, and the tree must have no limbs, save on the very top. In the upper portion of this choice situation, whence the branches begin to fork, the Solomon islander weaves in a foundation of light supple pieces of wood, and on this constructs his family residence. How to get up into his house, is quite an easy matter. No calculations are here necessary, as of broad flights of steps, or a cork screw stairs, the real *pons asinorum*, the stumbling blocks of all fool-hardy self constituted architects. The Solomon islander, takes one of those running vines, as strong as a steel rope and far more pliant, and letting this dangle down from his dwelling to the ground, runs up and down this improvised stair with the ease and grace of a squirrel.

The advantages of such a method of construction, perfect in all its details, are manifest. At night all the careful housekeeper has to do, is to haul up his flying stair case, and there he is, as safe in his airy house, as an old feudal Baron was with his portecullis drawn up. No policemen or night patrols are necessary for the protection of the house holder in the Solomon Island cities. Once snug in his house in the tree top, he defies the sneak thief and the burglar. Should a social neighbor wish to pay a visit, there is no door bell to pull, all he has to do is to tap the trunk of the tree, and instantly his friend aloft replies, and down comes the hospitable ladder. If it should happen to be an unwelcome comer, the wary Solomon man has ready at hand an assortment of heavy stones, which he can drop on the head of the intruder. Calls from one house to another of an informal character, by means of the vine cables, which are thrown from one airy lodging to another. Of course going home or going to bed, must depend on the personal climbing power of the Solomon islander, and his monkey like ability, adds another strong link to the Darwinian chain.

To the wonderful physical attributes of these primitive people, there are joined, however, certain other quite unfortunate tendencies. It is true that we might acquire a Solomon Islander in his own house, no end of useful information, as to the best methods of constructing a house, which would combine all the advantages of cheapness, comfort and good ventilation, still as he is a determined man eater, we are likely at least for the present to be dominated over by our own architect, who though he may be cruelly aesthetic, has not (as far at least as we are aware) any cannibalistic inclinations.

—A famous Prussian general was inspecting some military stables. "What do I see there?" he said, in tones of thunder, to the sergeant; "cobwebs?" "Yes, sir," was the respectful reply; "we keep them there to catch the flies and prevent them teasing the horses."

—If it wasn't for the ten cent stamp occasionally found in a chew of tobacco, a considerable portion of our citizens would starve.

THE ZOOLOGICAL GARDEN AT HAMBURG.

MANY of the readers of the FOREST AND STREAM have undoubtedly visited that most opulent and thriving old Hansa Town of Germany, and of those who have been at that city in later years, few will have failed to visit the Zoological Garden; a creation which has arisen with almost American rapidity, and has been prosecuted with an energy which makes it now one of the best collections in the Old or New World.

Passing recently a few days at Hamburg in the company of a New Yorker, well acquainted with the city, while I was comparatively a stranger, we were on a very lovely June afternoon leaving the very excellent hostelry, "The Zum Kronprinz von Preussen" which fronts that most charming of all European city prospects, the Alster Basin.

Between three and four of any afternoon, the fashionable promenade of the Hamburgers is along those magnificent sheets of water, arms of the Elbe river, which, spreading like lakes in the very midst of a populous city, in my opinion surpasses in beauty the Newa Prospect, or the Seine in the city of Paris. The Jungfernstieg in Hamburg is one of the European sights. We were quite uncertain which way to turn, when we reached the long viaduct over the water, where several roads diverge, when my friend said: "We are near the Damm Gate; to-day is a 'reserved' day for the stockholders and strangers, let us go to the Zoological Garden; we will not meet any mixed crowd, and will be able to see what is to be seen at our leisure; and besides, will have a chance to take a look at the Hamburg belles and beaux."

Neither naturalist nor zoologist, as these subjects have always interested me, I gladly entered into my friend's proposition. The road "near the cemeteries" brought us to the chief entrance of the Garden. Before entering, it may not be amiss to state how these gardens originated.

The Zoological Garden at Hamburg is not a State Institution, as are most of the other Continental collections of a like character, nor does it receive any aid from the Senate or the Assembly of the Free City. It owes its existence to the love for Natural History, and to a desire for useful information, and owes its origin to a number of eminently successful and wealthy mercantile gentlemen of Hamburg, such as Messrs. A. Meyer, Booth, Schiller, DeCraker, Nötting, Diöze and others, but particularly to the energy of the late Baron Ernest von Merck, the father of the enterprise, whose memory is honored within the garden by a most excellent bust erected in what is called the "Winter House." On January 28, 1860, these gentlemen formed a provisional society; on the 10th July of the same year the first general meeting was held, all the shares were taken, and on the 17th of August, 1861, the government of Hamburg voted the Society the free use for 50 years of a large plot of land: a sandy desert without a tree lying near the Damm Gate on the outskirts of Hamburg. This ground, which was then worth nothing to the city, could not now be bought probably for less than a million Mark Banco; or thrice the amount of the whole capital of the Society, originally subscribed. It has had another effect. On all sides of this Park, as a nucleus, new streets lined with fine houses, have sprung up, extending through the city, so that Hamburg and Altona, and all the outlying places—villages but twenty years ago—seem now united in one grand whole. Messrs. Meuron and Haller were appointed architects; Mr. Jürgens head gardener, and Mr. Lienau water engineer for the necessary water works and constructions, by the Society. In November, 1863, the greater part of the necessary buildings had been completed, and on May 16, 1863, the Garden had arisen out of a wilderness to almost its present beautiful aspect; with groves and lakes and artificial hills crowned with old ruins; stocked by a well-assorted and splendidly housed collection of specimens from all the departments of zoology. The Aquarium is now one of the most celebrated in the world. The man who had with such love watched over this creation of his, was not allowed to enjoy the well-earned praises of his fellow-citizens. Baron Merck, the founder of the Zoological Garden, died suddenly on July 6, 1863.

Entering the handsome gates where we procure our tickets at a moderate rate, we turn our steps to the deer houses, lying immediately before us, three in number, where we meet many old acquaintances, among whom a very fine specimen of our American Wapiti, (*cervus canadensis*), whose magnificent antlers are the admiration of all visitors; a noble red deer, a present of the late King of Hanover; a rein deer, and above all an elk, which species is getting scarcer in Europe every year, and is only found in very small numbers in East Prussia, Lithuania, Poland, Russia, Norway, and Sweden. There are, in all, some fifty specimens of the various species here collected. A few steps further we stop before an enormous house, devoted to birds of prey, where vultures, eagles and falcons are kept, each species to themselves in almost perfect liberty. To mention but a few of the many fine birds, there is an enormous condor from the Andes, truly the king of birds, of which Alexander von Humboldt mentions, to illustrate the enormous heights they ascend, 16,000 feet high, that he saw one of these birds hover above him, a mere discernable speck. A specimen of a very scarce eagle, the "fighting" eagle—*spizaetos bellicosus*—we found here, of whom Le Vaillant gives so bellicose an account as being the most combative of all eagles. Its home is in Central and Southern Africa, and it is found comparatively seldom in collections. Our American national eagle and our buzzard were not unrepresented.

The wombat and kangaroo houses were of interest. In the latter, the pranks of its inmates amused us exceedingly. A whole family was assembled in one of the partitions, and were raised in the Garden; this feature of the reproduction of the animals in the gardens having the greatest attention paid to it, and in most instances with the most flattering success. Part of the "fowl-house" was tenanted with several hundred inmates; for this Hamburg Fowl House comprises both domesticated and wild birds. We halted a moment on our way at the "beaver house." Here two of the inmates had begun to build their dam as in nature—great attention having been given to an exact reproduction of their natural elements, water and seclusion. United with the fowl house is the "monkey house," where the apes of the Old and New World are plentifully assembled. Then we passed to the camel and elephant houses and the "Terrarium" where tortoises, lizards, snakes, among which the only poisonous continental snake, the *Pelias Berus*—frogs and salamanders, in hideous assembly do congregate. A special plot is given to the agoutis, porcupines, viscachas, marmots, bobacs, and the like. Suddenly a bend in the road brings us to a truly sylvan scene, the lake for the water birds—one of the most attractive features of the Garden. Here we find the whole family of ducks, geese, swans, and pelicans in seemingly innumerable congregation. Here the children and the nurses, young and old, assemble. From the German opera, the "Freischütz," the name "Wolves' Den," has been given to a rocky and wild portion of the Garden built of rock; and here we find fine specimens of the wolf and the *lycaon pictus*, ever walking to and fro in silent discontent. Past the sheep stable we come to the "gallery for smaller beasts of prey," such as the civet cats, the jackass, crab wolf, foxes, and corsacs. That noble beast, the wild boar, is the most notable specimen in the "pig sty." A beautiful feature of the Garden is the "owl's castle," an artificial ruin in which the night birds of prey are kept; and which is built upon an artificial eminence some one hundred feet in height, with a fine tower, having a special staircase, from whose top is a most enchanting view of the whole Garden—the rich and populous city with its many spires in a long semi-circle closing the view. One of the most interesting galleries is the "gallery for beasts of prey," immediately below the castle, in which that terrible family of cats, beginning with the lion, is well represented. The Hamburg lion is a native of Western Africa, one of the finest animals now existing in any collection; his mate is no less distinguished; the three cubs horn shortly before our visit, all males, were being tended with great care by their mother. The pair of tigers is one of the most celebrated features of the collection. In this principal gallery there is a fine puma, a jaguar, a leopard, and a panther. The "ostrich house" is well provided; and in the "bear's den" we found an *ursus arctus*, *tibetanus*, and an exceedingly fine Polar bear. Next we visited a house for flamingos, ibis, curlews, ruffs, plovers, and rails; also special preserves for the cranes—among which was a *grus antigone* and storks. There is a house for the tapirs, one for the buffalos, and the otter basin. A very large house with extended plat in front, is built for the giraffes, gnus, antelopes, elands, gazelles, kevels, and springbucks; a special hut is for the yak and zebu. Another lake gives free play ground to the seal; near it are housed the llamas, the asses, the moulons; a *volière* for all sorts of parrots is not wanting. Another artificial mount with a Swiss chalet brings us to the "Chamois Mount," with very fine specimen of chamois, ibex and angoras, with several other reservations containing lesser animals. Forty or more different buildings have been required for the five hundred or more inmates of this Garden.

While we were thus visiting the Garden, the writer taking a few notes, a merry throng moved to and fro through the Garden, where everything which can interest and charm both mind and eyes is so happily united. Our survey ended, we emerged from the shrubberies and intricate walks of the large Park to an open place fronted by a very large and elegant restaurant, where a band of excellent musicians were playing to an assemblage of thousands of Hamburg ladies and gentlemen. The most exemplary order and decorum were universally preserved. F. S.

WARD-BURTON'S MAGAZINE RIFLE.—We received a visit from Mr. Bethel Burton, the inventor of the Ward-Burton Rifle. The rifle shown us was a magazine gun on the bolt system, shooting eighty grains of powder, a perfect beauty, but differs materially from those of other inventors on the same system. The special mark of merit, which is claimed by the inventor, is its simplicity. The rifle is light, strong, serviceable, easily handled, fires with rapidity, and with slight recoil. To give a mechanical description of a rifle in a newspaper article, would be almost impossible; the rifle must be seen, handled and used before a decided opinion can be passed upon it. If Mr. Burton will make all his sporting rifles precisely equal in every respect to the one shown us, we predict it will be especially acceptable to sportsmen. Its shooting qualities cannot be gainsayed, as at Creedmoor in shooting for a prize, five rounds off hand at 200 yards, it made two bull's eyes, two centres and one outer, and in private practice, has made many bull's eyes in succession, at 200 yards. The gun has been tested in Europe, and passed through the trying ordeal of the Board of Ordnance Officers of the United States with the greatest merit as a most efficient arm. The St. Louis Army Board say "the arm is serviceable and cheap, the breech action simple and easily understood; the gun has a low trajectory and slight recoil; any cartridge can be used if of the same calibre as

the rifle; the stock is in one piece, is capable of rapid firing without having but seldom to be cleaned. The gun invented by Bethel Burton, with its details, satisfies all the requirements of a military arm. Besides, it is impossible to blow out the movable breech, which is suited to any calibre. The piece weighs but eight pounds and its penetration is great." Mr. Burton will make any kind of rifle required, any size, bore or weight; the magazine can be shortened to carry any number of cartridges from two to eight.

We propose publishing very shortly a very thorough and exhaustive series of articles on the breech-loading rifles manufactured and in use in the United States. These articles will be furnished to us by the makers themselves, and will be illustrated with numerous cuts. We will thus supply a want, and the subject so treated will undoubtedly be of great interest to our numerous readers at home and abroad.

Sporting News from Abroad.

IN our last review of English sports, we may have spoken somewhat unreservedly in regard to Her Majesty's stag-hounds, and the peculiar character of this chase. The last recorded run by those hounds was, according to our ideas, even less worthy of being called sport than the first one. This time the stag appears to have been let loose from his box in the midst of a mob, his head pointed in the direction the huntsmen wanted him to go, and then a rush was made for him, and he was finally forced to run, by having missiles thrown at him. "Near the top of a hill some ruffian, (a correspondent of the *Field* is our authority), set a greyhound on the stag and drove him into a thick hedge, when another ruffian belabored him with a thick stick." Finally the stag took to an out-house, and very wisely stayed there, and so the hunt ceased. We affirm that this is not sport. The fact of boxing up any animal, and letting him go again, to be chased by men, horses and dogs, must ever remain an anomalous thing in sport, even though that animal be a tiger. To seek the fox in his covert, to beat the gorse to track him in his lair, calls upon both men and dogs to display in every way their hunting instincts, but to select a stag from a park, where he has been pampered, and let him loose, to be followed to the death in the woods or in a lady's greenhouse, is an absurdity, no matter whether the start be at Salt Hill or at Fontainebleau. Men may ride fifty miles after the stag, may break their own necks, or kill their horses, when in pursuit of a boxed up stag, but, as a sport, it is ridiculous, and here in the United States, most people think with us, and in England, conservative as they may be, every year we hear of good sportsmen who decry the Royal Stag-hunt.

—There is an article in one of our English contemporaries, in regard to hunting tigers, which if true, is quite curious. A tiger hunter in India begs that "members of the Civil Service be forbidden from killing tigers," for this reason, that the Civil Service men monopolise all the tigers in their district, and will not allow any other people but Civil officers to shoot them, and that they thus actually preserve tigers for the sole purpose of killing them themselves, and that in this way the tigers, which could be killed by any one and soon be exterminated, were positively allowed to increase for the amusement of a privileged class. It is hard to find out the truth of a charge of this character, for grumbling is an inherent English taste.

—Henry IV., of France, who was a gallant hunter, took once into his service the chevalier d'Andrezzi with his pack of dogs, and made him his Grand Wolf hunter or *Louvetier*. That wolves are still found in France is well known. In the *Chasse Illustrée* of the 22d of last month, we find the following:—"Brittany is a privileged ground for wolves. In this department of France, notwithstanding the attention paid to wolves by Messieurs the Lieutenants of the wolf-extermimators, these animals live, thrive and prosper, and bring up a numerous progeny doubtless with much profit and pleasure to themselves, but certainly to the disadvantage of the neighboring farmers, who are forced to furnish the wolves with their daily repasts. But the time occasionally does come when the farmers get tired of paying for the keep of these hungry rascals. Complaints of depredations pour into the Prefect, who transmits his orders to the wolf killers and to the *agents forestiers*. Battues are arranged, which generally conclude rather disadvantageously for the wolves. The neighborhood of Châteaulin is particularly infested by wolves, and the peasants, aware of the losses they suffer, wage constant war with them. Besides preserving their sheep when anybody kills a wolf, he receives quite a neat amount of money for their destruction, the Conseil General of Finistère having decided to augment quite largely the reward for wolf killing. Among the most conspicuous wolf slayers is Michael Cornec of Kerjeau, who recently killed five wolves, two of them last week. The Marquis de Kerné, an indefatigable hunter, with Lord Douglas du Plessis, wage incessant warfare with these beasts. Nevertheless, they are so abundant, that it seems impossible to exterminate the wolves. We trust that more efficacious measures will be adopted in order to encompass the entire destruction of these animals."

—One morning, says the *Field*, a woodcock alighted at the feet of a cabman on the stand facing the Eyre Arms, St. John's-wood, London. The man threw his hat over it and caught it, and afterwards sold it to a poulterer in Circus-road. It was a very fine bird, in good plumage and condition.

—We notice in *La Chasse Illustrée*, that in the department of Somme (a portion of the old Picardy) a sportsman had killed two Ibis. These birds are rarely found out of Egypt, or at the mouth of the Danube.

—There is every reason to suppose that the British Government will send out this coming spring an Arctic Expedition. An exhaustive memorandum has already been drawn up and submitted to the Council of the Royal Society for their approval, each section of which has been prepared by the most distinguished authorities in England. To the Royal Society the Geographical Society have also given their aid in bringing the matter before the Government, and the Dundee Chamber of Commerce, from commercial reasons have added their influence. Mr. Gladstone and Mr. Goschen will be shortly interviewed, and the full importance of Arctic research will be placed before them. It was Mr. Gladstone, who, when he was on the Select Committee of the House of Commons on the occasion of Sir John Ross' proposed expedition to the North Pole, made use of these remarkable words, which are worth recording:—"A public service is rendered to a maritime country, especially in times of peace, by deeds of daring, enterprise, and patient endurance of hardship, which excite the public sympathy and enlist the general feeling in favor of maritime adventure."

THE BALTIMORE OYSTER TRADE.—The panic and the depression in all business of late has had an effect on the Baltimore oyster trade. There are fifty odd packing houses in Baltimore, employing a capital of \$6,000,000, who ship annually fully twenty millions of gallons of oysters. At present the oyster business is so slack that none of the houses are working on full time. The largest house, Kennett & Co., who at this time of the year usually employ fully 500 hands, have now hardly 100 people at work. In busy times no less than 10,000 people open and pack oysters, but to-day 2,500 or 3,000 is about the total count. It seems then that prosperity and the bi-valves go hand in hand in America, and not poverty and oysters, as Sam Weller once remarked.

Shot Gun and Rifle.

GAME IN SEASON FOR DECEMBER.

Moose, <i>Alces Melchis</i> .)	Caribou, <i>Tarandus Rangifer</i> .)
Elk or Wapiti, <i>Cervus Canadensis</i> .)	Red Deer, <i>Cervus Virginianus</i> .)
Rabbits, common Brown and Grey.)	Squirrels, Red Black and Gray.)
Wild Turkey, <i>Meleagris gallopavo</i> .)	Quail, <i>Ortyx Virginianus</i> .)
Ruffed Grouse, <i>Bonasa umbellus</i> .)	Pinnated Grouse, <i>Cupidoria Cupido</i> .)
	All kinds of Wild Fowl.

[Under the head of "Game, and Fish in Season" we can only specify in general terms the several varieties, because the laws of States vary so much that were we to attempt to particularize we could do no less than publish those entire sections that relate to the kinds of game in question. This would require a great amount of our space. In designating game we are guided by the laws of nature, upon which all legislation is founded, and our readers would do well to provide themselves with the laws of their respective States for constant reference. Otherwise, our attempts to assist them will only create confusion.]

—Six black foxes have been caught in Cumberland Co., Nova Scotia, this fall. These animals are very rare and their skins sell at fabulous prices.

—Old Phin. Teeple, of Preston, Wayne county, Pa., is seventy years old, though remarkably vigorous and looks hardly fifty. Since eleven years of age he has killed 2,985 deer and 438 bears. His favorite hunting ground is in Potter county.

—Many gentlemen complain of the unserviceableness of their decoys. If one is handy with tools he can make those that will give him much better satisfaction than the ones he buys at the stores; but if he can't tell an adze from a jackknife he had better not try it, and by abstaining save his fingers. Here are some directions that may assist the stool-carpenter: Select a clear stick of timber of cedar or pine, (cedar is the best) about five by seven inches. Cut it in pieces twelve inches long; make a pattern of pasteboard the shape of a duck, viewing it from above. Mark out the pieces of wood by the pattern, and rough them out with a hatchet. Make another pattern of the side view of a duck's head and neck when shortened or drawn in, and mark out some heads on a piece of inch and a half board, so the grain of the wood will come lengthwise of the duck's bill. If a saw mill is near have them sawed out, but if that cannot be done, saw them out by hand with a keyhole saw. Cut a square place in the body of the decoy about three quarters of an inch deep to receive the base of the neck. Fit a neck to each body, and bore a hole lengthwise through the head and neck into the body; make the joint of the neck with glue, and fasten the heads on the decoys by driving a pointed tight fitting piece of wire through the hole already made. By putting the heads on in this manner they are not liable to be easily knocked off. When the heads have been fastened, shave them in form with a draw knife, rasp them off smooth, put the finishing touch on the heads and crook of the necks with a jack-knife, and sandpaper them thoroughly. Buy some white lead, boiled oil, and dry colors, and paint them as near as possible like the ducks that are to be hunted. Old cedar rails are good material for the bodies of decoys. They may be made to look more natural by putting glass eyes in the head, set in holes in plaster. The plaster should be mixed in clean water. When used anchor them from a small staple driven into the fore part of the body, so the ducks will always head to windward, as live ones are in the habit of doing.

—We shall print in our next issue an exhaustive article on the grouse and quail of North America, from the pen of Prof. Robert Ridgway, of the Smithsonian Institution. This paper will be especially valued by those whom local names and questions of variety have puzzled from time immemorial. Now, with the species fully determined, the nomenclature once fixed ought to be universally adopted throughout America, so that we may know when a partridge is not a quail, and a pheasant not a partridge.

Rational Pastimes.

Secretaries of University and College Athletic Clubs will please mail their reports not later than Monday in each week.

—A Foot Ball match took place at New Haven on Saturday last, between eleven old Etonians from Eton School, England, now on a visit to this country, and one chosen from the Foot Ball Club of Yale College. The game was witnessed by a large number of people, and proved to be fully as exciting and interesting as the friends of the players expected. The Yale Eleven practiced hard to perfect themselves for the contest, and were rewarded by coming off the field as victors. The game was played partly according to the English rules and partly according to the American rules adopted at the late Convention, each side making some concessions. Among those made by Yale was one agreeing that there should be no lurking allowed near an opponent's goal. Yale's eleven was chosen from the twentys that have played against the clubs of Rutgers and Princeton colleges this fall. The English eleven was made up of graduates of the famous Eton College. The Eton game is hardly as rough as that played at Rugby, but requires greater skill and more running and dogging. The elevens were composed as follows:—*Eton*.—G. C. Allen, Lord Norbet, J. W. Balfour, R. M. Keerrell, Earl of Rosebury, E. Chaplin, C. W. Benson, (the famous Cambridge oarsman), E. S. Hansbury, R. Romilly, R. Russell, and H. M. Thompson. *Yale*.—E. V. Baker, C. Deming, F. L. Grinnell, H. J. McBirney, P. A. Porter, H. O. Bristol, W. S. Halsted, W. O. Henderson, A. Hotchkiss, J. L. Scudder, and T. T. Sherman. We take this from the *Tribune*, our correspondent's letters having been mislaid.—Ed.

—The "Main Line" nine of the Pennsylvania Railroad Office, rank high as amateur players. We give the names of the nine for 1874:—B. Taylor. W. DeArmond, A. Robson, E. C. Cox, F. W. Hutchinson, M. Deshong, I. A. Newbern, W. H. Wright and J. Roberts. Tenth man, J. Vanzandt.

—At a meeting of the Yonkers Curling Club, held last week, the following officers, representatives and skips were chosen for the approaching season:—Wm. B. Edgar, president; J. S. White, vice-president; Hyatt L. Garrison, secretary and treasurer; E. F. Shonnard representative to the royal Caledonian games; James Stewart, representative to the grand national games; Messrs. Edgar, Wheeler and Stewart, committee on pond; Messrs. Edgar, Stewart, Macfar-White, Shonnard and Frazier, skips.

—The three-ball French carom billiard tournament commenced on December 3, in Boston, Mass. The first game was between Peck and Hickey, and was won by the latter by a score of 200 to 174 points. Hickey's highest run was 23 and Peck's 22. The averages were—Hickey, 2½; Peck, 2 1-9. The second game was between Wilson and Dennison, the latter winning by 25 points. The highest runs were—Dennison, 45; Wilson, 26; and the averages—Dennison, 3 4-7; Wilson, 3½. The first game in the evening was between John Hickey and Lou Morris, Jr. The game was won by Hickey, whose highest run was 34 and Morris' 15. The averages were—Hickey, 6½; Morris, 1½. There was an exhibition three-ball game between Albert Garnier and Edward Daniels for 300 points. In the nineteenth inning Garnier, by a run of 84, brought the game to a close. Daniels' highest run was 36. Garnier's average was 15, and Daniels' 7½. They then played a game of 500 points with four balls, Garnier making the 500 to Daniels' 195.

—The first competitors on December 4 were—Messrs. Wilson and Lou Morris, Jr. Wilson made the champion run of the tournament, making on his twenty-ninth inning 51 points. Morris' highest run was 37. Wilson won the game by 31 points. His average was 3½ and Morris' 3. Time, 1h. 45m. The next game was between Peck and Pulsifer and was won by Peck by 6 points. Peck's best run was 20 and Pulsifer's 15. Time, 2h. In the evening the first game was between Morris and Dennison, and was won by the former making 200 to Dennison's 190. Morris' highest run was 16; Dennison's, 19. Morris' average, 3; Dennison's, 2½. Time, 2h. Hickey and Pulsifer played the next game, the former winning by 101 points. Hickey's average, 5; Pulsifer's, 2 2-5. Hickey's highest run, 32. Time, 1h. 15m.

—The billiard tournament was decided on December 6th. There have been 14 regular games, all the contestants having twice played with each other, except Peck and Wilson, and they commenced the game for the prizes. Wilson won by 20 points. Wilson's average was 2½; Peck's, 2½. The time of the game was two hours and ten minutes. Wilson then played the tie game with Dennison, which resulted in Dennison winning. Thus it will be seen that Mr. John Hickey wins the silver cup, \$250 and the championship, Mr. Frank Dennison the table that has been played upon through the tournament and Mr. Wilson \$250 in cash.

—Messrs. Garnier, Joseph and Cyrille Dion paid a visit to Philadelphia last week, understanding that the benefit to Mr. Plunkett was then to take place. Owing to some mistake, no exhibition had been announced. The New York players visited Mr. Plunkett's saloon, and afterwards, at Mr. Palmer's room, a game of one hundred points, French caroms, was played between Garnier and Joseph Dion, the former winning. The Professor afterwards, at Mr. Palmer's desire, exhibited his celebrated fancy shots.

—The championship match at the three-ball French carom game, between Albert Carnier and Cyrille Dion, took place on Tuesday of last week at Tammany Hall, 14th street. The game was won by Albert Garnier by a score of 600 to Cyrille Dion's 480. Garnier averaged 10. Dion, 8

8-59. Garnier's best run was 68. Dion's, 61. The game was played on a 10x5 Callender bevel table. Garnier is still the champion and retains the diamond cue.

—A meeting will be held at the Astor House, N. Y., on December 17th, for the purpose of reorganizing the National Association of Amateur Base Ballplayers.

PRINCETON, N. J., Dec. 1873.

EDITOR FOREST AND STREAM:—

Enclosed please find an extended report of the games played by the Oneida Base-ball Club of Orange, N. J., one of the leading amateur organizations in the country, together with the averages of its members: B. C. H.

RECORD OF THE ONEIDA BASE-BALL CLUB FOR 1873.

Date.		VICTORIES, Club.	Score.
June 28.	Oneida vs. Active, New York.		21 to 8
July 4.	" vs. Nassau, Brooklyn.		24 to 13
July 16.	" vs. Union, Newark.		24 to 11

—The Philadelphia Base Ball Club held its annual meeting last week. Ninety-two out of one hundred shares of stock were represented. After some discussion on finance, a dividend of twenty-five dollars per share or one hundred per cent., was ordered to be paid to the shareholders. The annual election for officers was then held with the following result:—President, George W. Young; five vice-presidents; Treasurer, James McColgan; Recording Secretary, Charles H. Tisdall; Corresponding Secretary, David L. Reid. William C. Dillingham and Francis McBride were elected to fill the Board of Directors.

Yachting and Boating.

All communications from Secretaries and friends should be mailed not later than Monday in each week.

HIGH WATER, FOR THE WEEK.

DATE.	BOSTON.	NEW YORK.	CHARLST'N
	h. m.	h. m.	h. m.
Dec. 11.	5 37	1 47	1 0
Dec. 12.	6 36	2 23	1 37
Dec. 13.	7 23	3 22	2 36

Dec. 15.	9 3	4 57	4 13
Dec. 16.	9 52	5 48	5 3
Dec. 17.	10 43	6 38	5 52

—The yacht Meta, owned by G. A. Beling of the B. Y. C., and built by P. McGeehan of Pamrapo, is to be altered to a schooner this winter. The Meta has made some brilliant performances the last season. We only trust she may meet with the same success as a schooner. Altering perfection seems to be rather risky, to say the least of it. *Nous verrons.*

—In a letter from our valued correspondent, in Detroit, on boating matters, he says: "I have been very busily engaged during the past month in attending to the arrangements for a course of lectures and entertainments which the Excelsior Boat Club of this city is giving to our citizens this winter, but will forward to you without delay the record of boating and yachting in our waters for the season."

—The members and friends of the Bayonne Yacht Club will meet together on the evening of the 23d, when the president will present to the successful yacht owners the handsome prizes won during the Autumn Regatta.

—Commodore Stanton Whitney, of the Eastern Yacht Club, is acting as referee in the Meta-Vision discussion, and will send to the owners of the yachts in a few days his final decision.

—Invitations are out for the first annual ball of the Washington D. C. Yacht Club, which will be given at Masonic Temple, Monday evening, Dec. 15.

—The Bayonne Yacht Club held a special meeting to take into consideration the propriety of joining the confederation and amalgamating with the New Jersey Yacht Clubs. Messrs. C. C. Hough, George A. Beling, T. D. Harrison, and Joseph Ellsworth were selected as a committee to meet similar committees from the New Jersey Yacht Clubs to confer together and discuss this important matter. This combination would make a strong organization and would doubtless add material strength to the yachting interest.

—The Crescent Boating Club of Philadelphia closed the season last week on the Schuylkill. We take pleasure in complimenting the Crescent Club for continuing their favorite pastime so long into the fall of the year and trust to hear good accounts from them next spring. The first race was in four-oared shells from the Girard avenue bridge to the steamboat landing at Fairmount. The boats were manned as follows: Crescent, E. A. Thompson, stroke; C. D. Tatman, second; H. F. Witmer, third; W. Barnhurst, bow. Chamounix, C. E. Steel, stroke; A. Spering, second; H. K. Hinchman, third; T. B. Harper, bow. The race, which was marked by a foul and an accident, was considered as won by the Crescent, they having the lead by about three quarters of a boat length. The second race was between four single shells, all of the same club, and was the best contested of the series, resulting as follows: First, H. F. Witmer; second, T. B. Harper; third, C. E. Steel; fourth, George Milliken. The third and last race was between the two double shells—Owlet, stroke, H. F. Witmer, bow, George Milliken, and the M. K. S., stroke, C. E. Steel, bow, T. B. Harper, and resulted in a victory for the former.

—The following men have been selected to make up the Freshman boat-crew:—W. S. M. Ryder and C. S. Ryder, of Sing Sing, New York; J. S. S. Tidd, of Westboro'; W. O. Weeden, of Providence, R. I.; A. M. Chadwick, of St. Johnsbury, Vermont; F. E. Sibley, of Warren; and J. A. Sanders, of Jaffna, Ceylon. These men will practice during the winter at the Gymnasium.

At a meeting of the Boating Association held after rhetoricals on the 19th, F. W. Whitridge of the Senior class, and H. S. Knight of the Junior class were elected delegates to the Boating Convention to be held this fall.—*Amherst Student*, Dec. 6.

—The new yacht La Belle, recently added to the Jersey City Yacht Club, is thirty feet long, and was built by Wm. Force for Col. Rucker, who is a member of that club.

[We have received this rollicking sketch of a jolly yachtsman which he entitles "Yachting Reminiscences." It describes the pleasures of a cruise to Martha's Vineyard, the perusal of which we doubt not will be enjoyed with zest by many a one who has been there.]

EDITOR FOREST AND STREAM:—

The announcement of the annual cruise of your club! What a host of pleasant memories associate themselves with those words! What brushing up of uniforms, and burnishing of gilt on cap and coat, with the view of sundry bright eyes "down east" along the coast to be pleased. Don't deny it, my brave skipper, that half the pleasure of the yacht trip, and being a member of "the club," is in the jaunty uniform and the many conquests made on the "annual trip." To the landsman, who at that season, is looked upon with as much commiseration as the "cit" is at West Point in the camping season, these moments of excitement and anticipation are unknown. The yachts must be "hauled out," the stores be hauled in; ah! what hidden mysteries are in these same "stores." The boxes, bundles, packages, cans, barrels, so accumulate, till the mind scarce comprehends where on the little vessel the steward finds the room for them all, but he does, and let the vessel "roll out" ever so much, not a glass jingles, nor a bottle breaks. See the boxes with the mysterious "P" or "Q" on each end, branded "mum," well, all the "boys" manage to keep "mum" until fairly under weigh, then the fusillade commences, and "dead marines" mark our track.

Lucky the yacht owners on such an occasion; lucky too those who are on terms of intimacy sufficient to secure them the invitation to go with them. There is nothing promising and realizing so much pleasure as the two weeks secured for the trip. Ready for the start and the rendezvous, the very yachts themselves seem to enter into the spirit of the occasion and plunge along careering, filling away, and jauntily throwing the spray with a saucy, "catch me if you can" manner. If the wind is good, what rivalry there is, what "hauling aft," and "trimming down," and the passing of a rival if possible to windward is a moment of proud and serene satisfaction.

One word as to the sailing of the yacht. Now don't be alarmed, I am not going into a long disquisition of technical terms, nor do I intend to discuss of the midship section, the run, the water line, the hips, knees, overhang, &c. I am a "devoted yachtsman" it is true, but it is in my devotion for the blue water and the white caps, the gentle, easy roll of old Neptune, and the bold, gallant dash of the vessel "on the wind," with everything drawing, or at night with everything furled and safely anchored in some quiet, land-locked and hill-girted harbor, to be lulled asleep by the gentle rippling gurgle of the water outside; to wake in the early morning with everything so quiet, fresh and clear, to take the health-inspiring plunge off the rail, which by the way is the best remedy I ever saw for a "don't-feel-very-well-this-morning" condition. It is for all these that I am a devoted yachtsman.

But I was going to say a word on the sailing of the yacht, and it is just this, that in nine times out of ten as much if not more depends upon the crew and sailing master than

upon the fine lines and mathematical calculations of the theoretical modeller. Give me an ordinary fishing smack, or working boat with a tolerable reputation for speed and such a crew as the jolly and gentlemanly Ellsworth's and their comrades, and I will take her against any crack crew, manned with such a crew as I have seen on some yachts, working only for their monthly stipend, and will take hold of the sheet of a flying jib as if it were a thousand ton brig they were working. Give me a crew who will jump, and have their hearts in it, against such a crew as I have named, and your fine theories vanish in the wake of your vessel, and the smack is home ahead, and I would win my wager. Is it not so? Much of the success and pleasure of the cruise depends in a great measure upon your selecting a sailing master and crew, and I imagine that the owner of the peerless "Sapho" paid as much attention to these points and more perhaps than to useless and imaginary calculations as to the hull. Of course I do not ignore proper attention as to the model and lines of hull, but look to your sails, rigging, crew and sailing master.

But I leave these points to some one better qualified than I am, feeling that my view will find assent, and let us go over in imagination some of our cruising recollections.

What a glorious cruising ground for a summer trip is the Long Island Sound, seemed formed by nature for such a purpose, with its merry anchoring grounds and safe harbors at just convenient distances. Who will not remember the beautiful harbor of New London, so long a favorite anchoring ground for eastern going yachts, with the dreadfully stiff and formal "Pequot House," so aristocratic, and as a sequence, cold, though "us boys" use to wake up the echoes of the gloomy bar-room, down below stairs, with our songs in a manner that must have surprised the stately occupants of the dignified mansion. I think we were all rather glad to get on the more free and fuller fun of Newport, which place although as aristocratic still was more cosmopolitan.

But the culmination of fun was reached when we arrived at Martha's Vineyard, with its pretty girls, its lovely walks, and oh! that bliff. Those who have "been there" will sigh when they recall the place of vows and declarations made to Martha, Jane or Hetty. "Can I trust you? You yachting man are so hard to understand." Ten to one the girl with her New England cuteness was getting the best of it and laughed after you were gone, and looked out for the next yacht. "Oh, Josie, there's a gun, it must be a yacht. Perhaps George has come back any way. I hope there are some handsome fellows on board." They arrive and soon Josie and George are walking together, and the campaign commences. The season of 1869 was an exciting one. We had with us on the cruise the English yacht "Camilia," and her well known owner, Mr. Ashbury. Before the Camilia arrived at Oak Bluffs, at the Vineyard, I think the day before, there was a jolly party of yachtsmen assembled at the Vineyard, among them Dr. Sayres, of New York, jolly, fat and up to anything in the shape of fun. I hope he will excuse me for using his name. He was arrayed in a red waistcoat under his yachting jacket, and looked decidedly British. The thought struck us to pass him off as the owner of the Camilia. So he assumed the English in accent and style; we addressed him as Commodore Ashbury, and soon all around were paying him attention. We entered one of those saloons where everything to eat and nothing to drink was the bill of fare, but what you did get was so good. "Commodore," said one of the party, "try an American dish;" handing him some pork and beans. "Eh, what's that; really, ah; a queer kind of food; I never eat them, you know, at 'ome; ugh! beastly; possible you can eat such food 'ere? 'ardly fit for the dogs. Lan'lord, 'ave you chops?" &c., &c. It was laughable to see the attention that "lan'lord" paid him. With a hundred eyes looking through the window, and the serious and lordly manner with which the Dr. played his part, it was all we could do to restrain ourselves; but the climax was reached when the landlord's daughter went into the adjoining room and from a wheezy, camp-meeting melodeon commenced to dole out "God save the Queen." Even the Dr. himself could contain himself no longer, and all exploded simultaneously in a peal of laughter, the landlord adding fuel to our merriment by saying in disgust that we "were a triffin' lot of city nobodies;" and when we paid our bill by saying he "knew we were foolin' all the time."

The next day came the real Ashbury, and we soon initiated him into the mysteries of the camp meeting, for as the evening shades began to fall he was walking, tall, erect and stately, with a New England lass on either arm, seemingly delighted with the American style of camp meeting, and Oak Bluff in particular.

But a short sail from the camp meeting grounds, is New Bedford, that city of oil, piety and pretty girls. Here too was a great spot for the "boys," when ashore. There was one feature, though; you could not buy a drink for love or money, and this was upon some occasions rather an objection. I case of sickness it could be had at the drug store. Fortunately we had two doctors with us who gave us each the required prescription for brandy and water; in fact gave us two or three apiece, which we of course used. After having gone to the drug store two or three times each, the worthy druggist "smelt a mice," and broke out, "you are the healthiest lot of sick men I ever saw; this is played out; you get no more from me, doctor's writing or not."

Following the sailors motto while we were sailors, "a sweetheart in every port," we were soon in full and platonic acquaintance here with the fair lassies, much to the annoyance of their more sedate country lovers. But all these pleasures like everything else must have an end, and

when the orders came for breaking up the cruise, we point our bows westward, healthier, wiser and better men for the trip, having the fall regatta to look forward to, of which more anon.

The run up the Sound to New York is but a repetition of the sail eastward, with the difference that going east we were full of anticipation, now we are satisfied with its realization, settled in our minds that in yachting at least the realization is fuller of enjoyment than the anticipation.

—The Grayling of Michigan, must be a remarkable fish. We thought we were tolerably well informed of its times, seasons and habits, but confess ourselves puzzled to determine our precise bearings when we read the following extract of a letter from Mr. Fitzhugh, of Bay City, the true discoverer of this splendid game fish. He writes early in November, as follows: "My last day's fishing was in a furious snow storm, with six inches of snow on the ground. The Grayling rose like mad, and I only stopped fishing for the reason that enough had been caught." We don't know which to admire most, the pluck of the fisherman or the determination of the fish. The Grayling is a late spawner, and is in season long after the catching of trout is tabooed. It is taken from May until November. Of its game qualities there can be no question. It is an opponent even more determined than the trout. For the table it is superior. One of these days Grayling fishing will be all the rage for those anglers who desire a new experience. The favorite streams in Michigan are the Au Sable, Hersey, Muskegon, Manistee, and Au Gres.

—The Baroness Burdett Coutts has offered a prize of £10 for the best essay "on preventing nets from rotting," and another prize of the same amount for the best way of killing fish, such as of the basking shark, sun-fish, &c. These subjects are now open for competition throughout Ireland. The Prize essays to be printed and published with the author's name, at the expense of the Baroness Burdett Coutts.

—The Fish Association of Salt Lake, Utah, has bought twenty-two acres of land for their operations. There is a cold spring, with a discharge of about 500 gallons per minute, which furnishes water for the ponds. The trout are of the black speckled variety found in the streams upon both sides of the mountains, and their habits, as learned at their establishment, show them to be a distinct variety. While our *Fontinalis* spawn in November, and in the wild brooks are generally through in a month, these do not commence spawning until the last of April. While ours require from forty to seventy days to hatch, these hatch in fourteen days. The eggs also are smaller. The stock trout, about 250 in number were taken from Weber river about two years ago, and will weigh from one to three pounds. They are not equal to the *Fontinalis* in flavor. The common price is twenty cents a pound at retail.

—Formerly no market was so well supplied with fish as that of the Golden Gate; to-day the *San Francisco Bulletin* complains of a decline not only in quantity but quality of fish. The *Bulletin* says that fish are now almost as dear on the Pacific coast as they are on the Atlantic. Only the unsavory sturgeon seems to hold its own defiantly and multiply in the muddy sloughs. The belief has been expressed that the sea lions are principally responsible for the depopulation of the waters, but those who are acquainted with the habits of these animals assert that such is not the case, and very plainly too, for the monsters were doubtless quite as numerous and as voracious a score of years, or a century ago, as at the present time. Another explanation which is now given is the ravages which the Chinese are making upon the young fish. Hundreds of these assumed despoilers of every blessing are employed constantly in catching the young fish, including every species in the bay, just developed from the ova, in which work they employ fine nets, scoops, and other effective methods. This material is esteemed a prime delicacy among the heathen, large quantities being consumed in the city, and the business of preserving the young fish and shipping them to China has become an important enterprise. Thousands of young salmon, from two to four inches in length, may be found among the large supplies brought in daily to the fish shops in the Chinese quarters, and this is undoubtedly the true explanation of the alarming decline in the quantities of the best fish. This process continued for a few years will render salmon and other favorite species a rarity in these waters, and some enactment seems to be called for to afford protection from this particular encroachment of the Chinese scourge.

—The St. Lawrence fishing fleet have all returned to Gloucester, Mass., closing the mackerel business for the year. One hundred and seventy-five barrels were sold on Monday at \$13.75 for No. 1. About 100,000 pounds of codfish were brought in, some of which brought \$5.25 per quintal. The herring fishing is about to begin, and about twenty vessels have already started for the Grand Menan and Newfoundland fisheries.

—*Land and Water* tells of a salmon weighing fifty-one and a half pounds, caught lately at Lennel Haugh, in the Tweed.

—A correspondent of the *Cultivator*, writing from Salt Lake, says:—

in Bear lake, in the northern part of this valley, there is a red fleshed lake trout, which is said to be very fine. Mr. Rockwood hatched about 200 eggs his first season, and 10,000 the present spring. He had secured some eggs of the *Fontinalis* from the East, and about 600 of them had hatched and were doing well. He has lost very few of his parent fish, and he has the prospect of a large supply of spawn next spring. He had received from Prof. Baird about 6,000 shad fry from the East, which were planted in Jordan river in July. The attempt to raise shad in this stream, which flows into Salt lake, but has no communication with the sea, is an experiment of great interest to all fish culturists. They will have access to salt water in the lake, but the brine is so strong that hitherto no fish has been found in its waters. The mouth of the Jordan is a large bay of brackish water, which is said to abound in fish. Will the shad find here its favorite food, and deposit its spawn in the upper waters of Jordan? No one is well enough acquainted with the habits of the fish to tell the result.

Art and Drama.

GOSSIP OF THE WEEK.

BY T. B. THORPE.

ON Wednesday evening there was an unusual excitement among our habitual playgoers. There was to be inaugurated the New Fifth Avenue Theatre, a building that had been in its course of construction most frequently heralded by the press as promising to be in all its appointments the unrivalled playhouse of the metropolis. That the occasion might have a real novelty, it was advertised that Oliver Wendell Holmes was to speak a prologue, and then was to follow a new play in five acts, written especially for the initiation, by Mr. James Alberry, of London. Certainly here was material for a legitimate flutter. Tickets were of course at a premium. The ladies who were fortunate in having the entrée under the protection of gallant gentlemen were in ecstasies. They were thus charmingly excited by the fact of a "first view;" the prospect of that keen enjoyment so peculiar to a fashionable "opening," all the same, whether it consists in the display of the latest fashions, or the dedication of a costly dramatic temple. We were not excited. Some weeks ago there was "dedicated" the Lyceum Theatre, under favorable circumstances; its location and interior would be found quite faultless, but we inquired, after the manner of the prophet in the wilderness, what demand is there for this new place of amusement—what novelty has the management to offer the public? and the experience of the first night's exhibition answered, "There is no demand." There was not even a full house; there was no curiosity excited regarding its primal history or its future fortunes, and after a fitful struggle for recognition it put out its feverish lights, and, cold and repulsive, stood a monument of the folly of attempting to make architecture, upholstery, and scenic display take the place of "holding the mirror up to Nature." Men and women testified by this proper indifference that they desired to have their hearts warmed and their souls inspired, and did not want all the stage cunning simply addressed to the eye. They want, if possible, to have the deep fountains of their nature disturbed—feel emotions which reach the affections and the passions; seduced, indeed, into a mimic world, where they can realize the strange fascination that comes from living for the hour in others' woes, or enjoying others' ecstatic delights.

The Fifth Avenue Theatre is unquestionably a marvel of construction and internal adornment. It looks, indeed, as if it were a reception room of some wealthy Croesus, where alone could enter the children of fortune, and where the public, through the common medium of a purchased ticket, could have no part. The frescoes are entitled to the claim of works of art; the taste displayed in the choice of the prevailing colors being faultless. Where draperies are demanded, or can be used simply for adornment, you find the choicest crimson silks. Costly mirrors multiply the illumination and the audience into one interminable, fascinating maze. How "sweet" lisp the ladies; how "appropriate" to our habitual surroundings think the gentlemen; how superior to the severity of the theatres of the unhappy Greeks—those poor benighted souls of Athenia; and the miserable French, who for more than a decade awhile ago were satisfied with "Rachael" and plays that never changed the scene throughout five long acts; how in advance in refinement and luxuries is this metropolis of the western world write the astute Bohemians.

We do not deny that we have money to buy, and taste to bring together, material things that are splendid beyond comparison. But how stands the wealth of the mind? The great Elizabeth, of England, was compelled for want of something better, to have the floors of her palaces covered with rushes, and the theatres of her day were barns compared with the "Fifth Avenue;" yet she had Shakspeare for a playwright, and actors the record of whose powers remain bright after a lapse of nearly three centuries. Why did not Mr. Daly, with his superior advantages, order along with his frescoes and gilding a prologue, for instance, which was as good intellectually as his tapestries are splendid in color and material? and then conclude his ambitious work by procuring a play that was equal in all particulars to the general perfection of his comely house?

That it is possible to get a prologue written that is passable by comparison with the most commonplace of Goldsmith's time, we doubt. Garrick, Sam. Johnson, and their contemporaries, could rattle off felicitously a yard or two of

such jingling rhyme at a moment's notice, and a play in their day without such an introduction would have been an anomaly. The idea of reviving the quaint custom was respectful to tradition, but what a failure Mr. Holmes made of it. His home being in Boston, he has never had much to do with theatres; the inoclastic blood of his ancestors chills his muse when he touches upon the stage. Finding no natural inspiration in the subject he sings only of the bricks and mortar, and their hangings and their white wash. Of the object of the building he seems oblivious. The fact that it was erected for the purpose of dramatic representations is never alluded to, and the only theatrical characters that flash across "his fine fancy rolling" are the dramatic abortions of "Dundreary," "Jack Sheppard," "Dick Turpin," and "Robert Macaire." We hardly think it possible that the Autocrat of the Breakfast Table has not heard of "Hamlet" and "Macbeth," yet very clever men live in New York who have not heard of Milk street and the old South Church. Ignorance of celebrities is not, therefore, unpardonable.

That the prologue was pronounced heavy in advance Mr. Daly admitted by dividing it up between Miss Morant and Mr. Frank Hardenburg. It was given to the audience piecemeal—when Fanny Morant got fatigued with it she retired, and subsequently Mr. Hardenburg, of good physical strength, completed the task. One criticism serious is, that Mr. Daly might have found in the united literary ability of the empire city—a city in which the drama is at home—some one who could have worthily written the prologue. We think William Cullen Bryant would have done tolerably well, and we are sure that "Robert Macaire" and "Dick Turpin" would not have been by him mentioned to ears polite, that habitually wait upon the Fifth Avenue Theatre.

After the prologue—opening with a startling misquotation from Shakspeare—reading thus,

Hang out our banners on the stately town,
then followed the play, which, we were so carefully informed, "was written in London especially for this theatre," and certainly before the first act was ended it was apparent that the foul atmosphere of the modern Babylon had befogged the author's brain so that he could see nothing clearly, while, what must be a natural defect of his mind, he had no idea of a possibly perfect play. "Fortune" appears to be without any story; an objective point, if anything is apparent more than another, is that the author was endeavoring to copy some conceived models, and by this servility has produced nothing of his own that is meritorious, and nothing of his ideal that is not weak and unsatisfactory. The consequence was that the most critical of the audience left the house at the end of the third act, which ended just sixty minutes before church yards are said to yawn.

Mistakes are often made by managers—they are unavoidable; but we have never known one so glaring as the acceptance of "Fortune." Put upon the stage with all the care and good taste that have always distinguished Mr. Daly's efforts in that direction—the scenery perfect, the furniture rich and costly, the dresses all that lavish expenditure and the best judgment could accomplish, and carried on under the blinding excitement of a first opening, the whole thing, from the stage point of view, as a play was a miserable failure, and we regret it. That "Fortune" will run a brief career we have no doubt. The novelty of a visit to the house will for a time command an audience.

Now comes this question from earnest friends of the legitimate drama (the friends of the "illegitimate" are not in this question worth noticing), Cannot Mr. Daly get some really good plays, or must he fall back upon the proposition that with all of his splendid material resources and fine stock company he can present with success only plays that are founded upon suggestive adultery and the excitements of divorce?

—Monday night was memorable for what might be termed a grand theatrical attack along the whole line. Wallack's Theatre, as usual, presented a specimen of the best line of comedies, the new selection being Robertson's "Home." The name is charming, and suggests quiet happiness, yet enough to enlist the feelings for an evening's refined entertainment. The presentation on the stage is tasteful and complete, yet not overpowering. We never lose sight of the actors by the glare of the surroundings.

—The Union Square has brought out a new piece, called "Led Astray." So far as the scenery, the upholstery, dresses, and the actors are concerned it reflects the highest credit upon the management, and it is quite useless to say that a full and enthusiastic house greeted the first presentation, as has at every subsequent performance. We confess our regret, most often repeated, that subjects for dramatic interest are not found other than "social immorality" for the basis of interest, as the name of this play ominously suggests. All unhappy women must be "led astray" before they become new or old Magdalens. We respect the delicate manner with which Mr. Boucicault approaches the natural denouement of something "more objectionable" in his next "legitimate play."

—At Niblo's a crowded house greeted the Christmas extravaganza of "Babes in the Wood," which play afforded the public the pleasure of seeing the incomparable Vokes family somewhat different from their usual role. In addition, was the appearance of Mlle. Bonfanti, after an absence from Niblo's of nearly four years. The "Babes in the Wood" will undoubtedly be popular, and it should be. The scenery is remarkable, of course, for its splendid effect, and the ballet is toned down until it is unexceptionable. If we are not mistaken, the little folks will take entire possession of the matinees.

—At the Fifth Avenue Theatre we have "Old Heads and Young Hearts."

—Our permanent citizens and the world of visitors which make up our winter population can find no fault in the variety and perfection of our amusements.

CINCINNATI, December 6, 1878.

The heavy rains during the first part of the week were an effectual damper on large audiences, but in the last three days the houses were very full.

ROBINSON'S OPERA HOUSE.

Sothorn's second week here has been quite as successful as his first week. "Sam" was given on Monday and Tuesday. Although "Sam" is not the counterpart of his brother "Dundreary," Mr. Sothorn makes the two so much alike that "Sam" is only a sequel to it. Wednesday, Thursday, Friday, and Saturday he gave "David Garrick." It was not appreciated by either the public or press as it was thought it would be. Mr. Sothorn's fame in this one piece seems to have been gained solely through the medium of the press. December 8th, Miss Charlotte Leclercq.

WOOD'S THEATRE.

The second week of the "caw-hammer adultery drama," as an old actor calls them, has been attended by large audiences throughout their stay. Monday, Tuesday, Wednesday, and Saturday "Article 47" was given. The piece was superbly mounted throughout, as was all the other plays that were produced. The remainder of the week "Alix," the pretty little French "society" drama, was given. We think this piece, with the exception of "Fernande," to be the most interesting of the kind that it has been our pleasure to witness. December 8, Mrs. Chanfrau.

PIKE'S OPERA HOUSE.

Monday, Mr. Charles Bradlaugh delivered a lecture on "An Englishman's View of the Irish Question." It was attended with an audience composed of the elite of literature of this city.

MOZART HALL.

MacEvoy's Hibernicon was here all this week. It was a treat for the Irish population. December 8th, Sharpley's Minstrels. W. L.

New Publications.

[Publications sent to this office, treating upon subjects that come within the scope of the paper, will receive special attention. The receipt of all books delivered at our Editorial Rooms will be promptly acknowledged in the next issue. Publishers will confer a favor by promptly advising us of any omission in this respect. Prices of books inserted when desired.]

CHRISTMAS TIMES AND GIFTS.

The Holyday season, the days of good wishes and cheerful congratulations are drawing near. The natal day of our Saviour, with all its blessed memories will soon be here. Christmas has its sweet and pleasant wishes, its days of presents, of gifts and good wishes. At the approach of this anniversary of the day when a Saviour was born, it is quite appropriate to celebrate it in a fitting manner, a day replete with all the old time-honored associations and thrilling memories of that hour when the morning stars "sang together for joy," and that great announcement of "peace and good will to men" was proclaimed. Aside from a commemorative festival, the 25th of December has long been considered as a day for the "giving of gifts," and exchange of "good wishes of many happy returns." Among the many appropriate presents for the occasion we place books, as fitting and always acceptable remembrances of the pleasant season. And our friends have before them a very ample stock of books for the season from which to choose "a gift for a friend." In all their rich and elegant variety, our Boston publishing houses place, in blue and gold, upon their counters, the histories of many climes; Osgood & Co. present to us their numerous treasures of the land of the Tropics, with their wonderful adventures. The student and the clergyman, the man of leisure, and the man of letters, of course will give them an hour's call. Paterfamilias will here buy the literary treasures that will gladden so many young hearts and make the eyes of so many little girls and boys sparkle with joy.

Nor are Hund & Houghton of Riverside to be forgotten. Here you will find those interesting "Wonder Stories," by Hans Christian Anderson, and many others very desirable.

BOOKS.

AGAINST THE STREAM. By the author of the "Schonberg-Cotta Family." New York: Dodd & Mead. 589 pages.

This is a most charming story of the heroic age in England. Every one knows who has read the "Schonberg-Cotta Family," that the author is not only a pleasant but an amusing and instructive writer. After wading through the debris of many yellow covers, and tossing others of no great merit out of the way, we can truly say it is refreshing to take up a work like this one entitled "Against the Stream." We find ourself in another and a better atmosphere. We love to dwell upon those developing traits that portray the outbursts of a noble nature, chastened and refined by fixed conscientious principles of right and wrong. The progress of such a nature, the noble strife of such a life is here unfolded before us, and the reading of such a work cannot be other than beneficial to all, young and old, into whose hands it may fall. We can most frankly say that although it does not claim to be a religious novel, there is more of the spirit of the truly grand elements of the living gospel of love than we find in many labored memoirs and doctrinal books of the day. Librarians in search of true, good, reformatory books for the circulating or sabbath-school library, should not pass this by, but place it on the shelf of the school-room as one of the best books of the day. A thorough and careful perusal of this book can do no harm either to pastor or people. No more criticism we might give of this will be so good as a careful study of it.

FANNY'S BIRTHDAY GIFT: By Joanna H. Matthews, author of the "Bessie Books." New York: Robert Carter & Bros.

This is a neat holiday book, and one that may with safety be placed in any library for our young folks. Fanny's birthday is introduced to us in this quaint form: Fanny "is standing at the foot of the back stairs in her father's house, looking up at the ponderous figure which was slowly making its way downwards. A pleasant voice it was that spoke, a bright young face that was raised; and dearly old black Becky loved both one and the other." Our readers will find this equal to the best of "Bessie's Books." It well sustains the character of a pleasant miscellany of stories for the young. Its contents are as follows, and the stories are deeply interesting and vigorous: The cold chicken; Harold's dilemma; Jenny's hopes; In the nursery; Fanny's sacrifice; Jenny's home; Grandpapa's offer; Peanuts and a sermon; The birthday; When she won't, she won't; The storm; An escape; Who wins?

BY AND BY. An Historical Novel of the Future. By Edward Maitland. 12mo. 460 pages. New York: G. P. Putnam's Sons.

All readers of a work published not long since under the title of the "The Pilgrims and the Shrine," will at once see that "By and By" is one of that same school of philosophical novels, handling the plain the knotty, abstruse and profound questions of the day. The author's preface sets forth the idea in these words:

It is an attempt to depict the condition of the world at a time when our own country (England) at least shall have made such advance in the solution of the problems which harass the present, and shall be so far relieved of all disabling artifices, social, political and religious, that individuals will be able without penalty or reproach to fashion their own preferences, the sole external limitation being that imposed by the law of equal liberty for all. "By and By" presents a state of society in which the institutions are promoted to their proper supremacy over tradition and convention.

This last remark will not come up fully to the standard of some of our orthodox christians. Here is a fault we are sorry to see mar so good a work as the one before us. Ignoring entirely "tradition" and "convention," the work possesses an interest not often found in works of this kind.

The ST. NICHOLAS for December. Scribner, Armstrong & Co.'s new Magazine.

To give faint praise to this deservedly valuable addition to periodical literature of this peculiar class (reading for the young), would be to do an injustice to St. Nicholas, which we by no means intend. We were pleased with the first number. It is quite difficult, we know, to make a magazine for children acceptable in all its departments, from the fact that the articles prepared for the same are designed, not for youth alone, but for many younger readers. So far as we have examined this last candidate for public favor, we can say it meets the wants of our "little folks" as well as our "young folks." Children always like the real better than the ideal. "Now, is that true?" said quite a little girl to me after listening very attentively to a story in the "St. Nicholas." "Yes," I replied, "that is all true; but why do you ask? Do you not like stories?" "Yes, I like true stories, not make believe ones. If the stories in the 'St. Nicholas' are true, papa will take it for me; he said he would."

Our observations upon the success or non-success of juvenile magazines only strengthens our opinion that we sometimes do an injustice to our readers, by placing before them too much of the unreal and fictitious. Children do not like to be treated always as children, even in their magazines. They are at quite an early age capable of forming an opinion for themselves. Said a bright little girl of eleven years: "I want to take 'Olivia Optic's Magazine,' not 'Little Tales for Little Girls.'" And this young miss also liked to read neat stories. To edit such a magazine as may be the magazine *par excellence*, for our young miss of eleven and our young lady of sixteen, requires ability, tact and talent. The best of reading for such a magazine is not too good. We hail the "St. Nicholas, as an omen that the days of effeminate baby talks are ended, and our young folks are to be treated to a literature that is instructing, corrective, elevating, and such as they can understand.

THE STORY OF THE EARTH AND MAN. By J. W. Dawson, LL.D., F. R. S., F. G. S. Author of "Archæia." New York: Harper & Bros.

In this new work by Dawson we have a book that treats of geology in a most thorough and comprehensive manner. Every reader who would be instructed in the facts of the science of geology, as relating to our planet, as well as some of the theories that have for some considerable time agitated the scientific and general student, will read this work. The manner in which the story is told, the trite and concise statement of scientific and other facts, will enable almost every careful reader to fully comprehend this whole subject, as it is here placed before them. The silly (we had almost said) theories of Darwin and his very peculiar views, and little favor with Dr. Dawson. Anyone who may be inclined to a belief in the Darwin Theory of the "descent of man from the ape," who will bring an unprejudiced mind to the consideration of this wild theory, as discussed in this work, will have no cause, we think, to conclude that some big ape of thousands of years ago was his great ancestor. Read this work carefully, if you desire to know just what geology does and does not teach. Mr. Dawson says, very truly, what will be accepted by a large portion of American readers, "that all things have been produced by the Supreme will, acting either directly or through the agency of the forces and materials of his own productions." And it is a relief, in these days of doubtful theories and false speculations, to take up a collection of compacted argument that completely overthrows the doctrines and theories of Darwin. We thank the Dr. for the sturdy, constant blows he has struck, not only against a false and ridiculous theory, but also the prevailing tendency of the times to a disbelief in the harmony of the written word with scientific and geological development.

A TOUR THROUGH THE PYRENNES. A splendid Holiday present.

This splendid square, 8vo., in cloth gilt, price \$10, and in full morocco \$20, elegantly illustrated by Gustave Dore, has just been presented to the reading world by the well known publishing house of Henry Holt & Co., New York. The author, Mr. Traine, so well known in his previous works of "History of English Literature," "Travels in Italy," etc., has conferred a lasting benefit upon all who would place a fitting *souvenir* of the seasons in the hands of their friends on the coming Christmas and New Year's festive seasons. No pains have been spared to make this book every way worthy of the giver and the recipient. It is a very large, elegantly illustrated work, not to be surpassed by any of our holiday books. This work contains 600 pages, together with 200 or more illustrative cuts by Dore. The work will be found extremely valuable for the correctness of its historic information, descriptions of scenery, and many natural and curious subjects, heretofore unknown to many of our readers. Besides the above, the reader will find a real pleasure in reading an account of many persons who acted prominent parts in the history of France and Spain, as Henry IV., Madame de Maitenau, Sully, Jeanne d'Albert, Voltaire, Froissart, Mlle. de Segui, and many others. We shall notice this work again hereafter.

ANNOUNCEMENTS.

T. B. Ford & Co. will soon publish PLEASANT TALK ABOUT FRUIT, FLOWERS AND FARMING, 1 vol. 12mo. In press.

NORWOOD; or Village Life in New England. A Novel. 1 vol. 12mo. Illustrated. In press.

good Match Bat, Clapshaw's make; price, \$3.00; or
one best Dark or Duke's tripple sewed cricket ball,
price, \$3.00; or one set of brass ringed cricket stumps,
price, \$3.50.

For \$20.00, four copies, one year, with one best
spring bat, one College bat, one Dark cricket ball;
price, \$7.50.

For \$25.00, five copies, one year, with a complete
cricket set; one College bat, one polished bat, Clap-
shaw; one Dark cricket ball; one set of stumps; price
\$12.00.

ARCHERY.

For \$10.00, two copies, one year, with one five feet
best English lance wood bow, bone tipped, with half
dozen best arrows; price, \$3.75.

FOOTBALL

For \$15.00, three copies, one year, with one Rugby
football; price, \$6.00.

FISHING RODS.

For \$5, one copy, one dozen assorted trout flies, by
the very best makers, Miller, Coachman, Hackle, Green-
drake, &c.; price, \$1.50.

For \$10.00, two copies, one year, with one four joint,
light bass rod, suitable for perch, pickerel, trout, black
bass; ash and lance wood; price, \$4.00.

For \$15.00, three copies, one year, with one superior
four joint, light rod, suitable for all kinds of fishing;
price, \$7.00.

For \$50, twelve copies, one elegant rod, can be used
as a 10, 10½, or 14 foot rod, suitable for trout, black
bass, with fly, or for trolling bass or pickerel; as fine
a rod that can be made; German silver tipped; hollow
butt; with three tips; ash and lance wood; price, \$25

CROQUET.

For \$10.00, two copies, one year, with one complete
set of croquet; price, \$3.25.

For \$20.00, four copies, one year, with very hand-
some set of croquet; price, \$7.00.

For \$25.00, five copies, one year, with superb set of
croquet; price, \$10.00.

For \$30.00, six copies, one year, with the best and
finest set of croquet made; price, \$14.

REMINGTON RIFLE.

For \$75, fifteen copies, one year, with one Reming-
ton Deer rifle; very fine; round barrel; 24 inch; octa-
gon barrel; 46-1000; price, \$28.

For \$100, twenty copies, one year, with one Target
Rifle; 30 inch octagonal barrel; to be used for sporting,
hunting, or target shooting; the best and finest model;
the rifle used at Creedmoor; price, \$36.

For \$100, twenty copies, one year, with one Reming-
ton double-barreled, breech loading shot-gun; new
pattern, just introduced; walnut stock; decarbonized
steel barrel; one of the best guns ever offered to Amer-
ican sportsmen; price, \$45.

SHARPE RIFLE.

For \$100, twenty copies, one year, with one Sharpe
sporting or target rifle; best quality; 26 inch, octagon
barrel; 40-100 calibre; oil stock; open sight; single
trigger; price, \$40.

WARD BURTON RIFLE.

For \$200, forty copies, one year, with one Ward
Burton rifle, magazine gun for large game, carrying
from 3 to 8 cartridges; calibre 45-100; length of barrel
24 to 26 inches; weight, 8 to 10 pounds. price, \$80.

**THE PARKER BREECH LOADING DOUBLE
BARREL GUN.**

For \$150, thirty copies one year, and one decarbon-
ized steel barrel, solid breach back action Parker Gun,
No. 12 gauge, 7½ to 8 pounds. Price, \$75.00.

**SINGLE AND DOUBLE BARREL MUZZLE
LOADING SHOT GUNS.**

For \$20, four copies, one year, with one American
single barrel gun, perfectly safe; blue barrels; wal-
nut stock; price, \$10.

For \$35, seven copies, one year, with one American
double gun; fine blue barrels; walnut stock; a handy
and reliable gun every way; price, \$18.

For \$50, ten copies, one year, with one double boys'
fine twist barrel gun; walnut stock; forward action
lock; a safe gun every way for boys; price, \$26.

For \$75, fifteen copies, one year, with double gun,
English Laminated steel barrels; handsome finish;
walnut stock; case hardened locks; a good and ser-
viceable piece in every way; price, \$45.

BOOKS.

For \$5, one copy, one year, with "Hallock's Fishing
Tourist;" price, \$2; or "Wingate's Rifle Manual;"
price, \$1.75.

ENGRAVINGS.

For \$5, one copy, one year, two elegant engravings,
Fishing and Hunting, Ridaux; price, \$1.75.

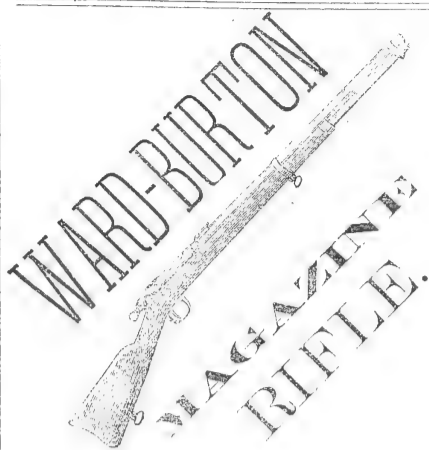

Every article is of the finest quality and will be
sent free of expense.

Persons getting up clubs can of course secure any of
the prizes we offer to subscribers.

To secure these most liberal prizes subscrip-
tions should be received by January 1st, 1874.

Send the names with the money, as fast as obtained,
that subscribers may get the paper at once. Back
numbers supplied when desired. Parties can have
until January 1st to complete their lists.

Sportsmen's Goods.

This Rifle, after being tested in the severest man-
ner by the late Board of U. S. Officers, appointed by
the Government to select the best arm for the service;
and after examining over one hundred different sys-
tems, including the best guns of Europe, say of it,
"that it is the best rifle they have seen, or of which
they have any knowledge. They therefore recom-
mend it for trial in the hands of the troops. A seven
pound carbine on this plan, with coarse military sights,
has made better targets at Creedmoor the past sum-
mer, than the best English and American target
Rifles weighing 10 pounds and having peep and globe
sights.

We are now making these guns to supply the nu-
merous demands, and will soon have them in the
market.

The following is our scale of prices:—

SPECIAL MAGAZINE RIFLE for large game,
carrying from 3 to 8 cartridges, 70 to 85 grs. of
powder, 350 to 400 grs. of lead, 8 to 10 lbs.
weight,.....\$60.00
and upwards, according to finish.

SPECIAL LONG RANGE MAGAZINE RIFLE
for Creedmoor shooting, 90 grs. of powder, 480
grs. of lead, carrying 3 to 8 charges, weight, 10
lbs. from.....\$100
and upwards.

MAGAZINE RIFLES for general use. Carry 3
to 9 cartridges. 60 grs. powder, 350 grs. lead
from.....\$40.00
and upwards.

SINGLE BREECH LOADERS for long range
Creedmoor shooting, 90 grs. powder; lead, 480
grs., from.....\$60.00
and upwards.

SINGLE BREECH LOADERS for general use, 6
to 7 lbs., 60 grs. powder, 350 grs. lead, from.....\$30.00
and upwards.

The calibre of all our rifles, unless otherwise or-
dered, will be 45-100.

All communications should be addressed to

REMINGTON'S

Sporting, Hunting and Target
Breech-Loading

Rifles and Shot Guns.

Long Range Match Rifles for "Creedmoor" Shoot-
ing, now ready. The same as won the "Turf,
Field and Farm" Badge, Aug. 2, and "Ama-
teur Rifle Club" Badge, Aug. 9. See re-
ports. Unequalled for accuracy by
either Breech or Muzzle-Load-
ers of other makers.

For simplicity of mechanism, ease of manipulation,
quality of workmanship and material, accuracy of
range, and penetration, WITHOUT COMPARISON.

"It is a noteworthy fact that though many different
kinds of rifles were used in the several matches, includ-
ing the converted Springfield, Remington, Metford,
Ballard and Ward Burton Rifle, every prize in all the
matches was won by those who fired with the Reming-
ton rifle, except the last."—From N. Y. Times, June
22, 1873.—(See full report.)

The Remington Rifle won Twenty-two

out of Twenty-three Prizes at

the Creedmoor Meeting,

June 21, 1873.

BREECH LOADING GUNS
A SPECIALTY.

We would call the attention of the public to our
large assortment of

Breech-Loading Shot Guns,
Manufactured by the following celebrated makers:
Messrs. W. & C. SCOTT & SONS (winners at the In-
ternational Gun Trial of 1873); P. WEBLEY & SON,
W. W. GREENER, WESTLEY RICHARDS, J. HOL-
LIS & SONS, and other makers.

A full line of fine
PISTOLS AND RIFLES CONSTANTLY ON HAND.

DIXONS & HAWKLEY'S SHOOTING TACKLE.

To insure good shooting from Breech-loading Guns,
we would recommend the use of the

STURTEVANT BRASS SHOT SHELLS,
manufactured by the Union Metallic Cartridge Co.,
Bridgeport, Conn. These shells are the cheapest and
best in the market, can be easily re-capped with ordi-
nary caps, without the use of the implements neces-
sary in priming all other styles of shells.

THE CROW'S CHILDREN.

A HUNTSMAN, bearing his gun afield,
Went whistling merrily;
When he heard the blackest of black crows
Call out from a withered tree:

"You are going to kill the thievish birds
And I would, if I were you;
But you mustn't touch my family,
Whatever else you do!"

"I'm only going to kill the birds
That are eating up my crop;
And if your young ones do such things,
Be sure they'll have to stop."

"Oh," said the crow, "my children
Are the best ones ever born;
There isn't one among them all
Would steal a grain of corn."

"But how shall I know which ones they are?
Do they resemble you?"
"Oh, no," said the crow, "they're the prettiest birds
And the whitest that ever flew."

So off went the sportsman whistling,
And off, too, went his gun;
And its startling echoes never ceased
Again till the day was done.

And the old crow sat untroubled,
Cawing away in her nook;
For she said: "He'll never kill my birds
Since I told him how they look."

"Now there's the hawk, my neighbor,
She'll see what she will see, soon;
And that saucy, whistling blackbird
May have to change his tune!"

When lo! she saw the hunter
Taking his homeward track,
With a string of crows as long as his gun
Hanging down his back.

"Alas, alack," said the mother,
"What in the world have you done?
You promised to spare my pretty birds.
And you've killed them every one."

"Your birds," said the puzzled hunter,
"Why, I found them in my corn;
And besides, they are black and ugly
As any that ever were born."

"Get out of my sight, you stupid!"
Said the angriest of crows;
"How good and fair her children are
There's none but a parent knows."

"Ah! I see, I see," said the hunter,
"But not as you do, quite;
It takes a mother to be so blind
She can't tell black from white."

PHOEBE CARY.

The Grouse and Quails of North America.

DISCUSSED IN RELATION TO THEIR VARIATION WITH HABITAT.

SMITHSONIAN INSTITUTION, December 4, 1873.

The laws of climatic variation in the color and proportion of birds, as applied to the species of our country, were first made known by Prof. Baird, in his celebrated work on "The Distribution and Migration of North American Birds," (American Journal of Science and Arts, Vol. XLI,) published in 1856; and Prof. Baird's outlines and principles of laws have been the germ of more detailed discussions by Mr. J. A. Allen, (see Bulletin of the Museum of Comp. Zool., Cambridge, II, 1871, pt. iii; pp. 186-250;) Dr. Elliott Cones, (see Proc. Phila. Acad., and American Naturalist, vol. VII, July, 1873,) and the author of the present article, (see Am. Jour. of Science and Arts, Dec., 1872, and Jan., 1873, and Am. Nat., vol. VII, Sept. 1873.) These laws of variation with climate, so far as they bear upon the North American Grouse and Partridges, I shall repeat in substance here; premising that they all originated with Prof. Baird. 1. Birds from the middle, open regions of the United States, as the arid plains and the great Basin, have

lighter, grayer colors than those of the States from the fertile prairies of the Mississippi valley to the Atlantic coast; if the plumage has dark bars, or streaks, these are narrower, and dilute in tint; brown tints become more grayish, rufous tints more buff, and the latter color white; at the same time the bird becomes slenderer, and the feet weaker; while these differences are often accompanied by a proportionate increase in the length of the tail.

2. In the moist, densely wooded regions of the Pacific coast, from the red-wood forests of the coast of California, northward, the colors are darker and the pattern of the markings less distinct than in the birds of the same species in the Atlantic States; the contrast with those of the central regions being still greater. Rufous tints become castaneous, the latter becomes sooty; ash becomes overspread with a smoky brown coat, or deepens into sooty plumbeous. In proportion as the dark markings intensify in color they also increase in extent, to the contraction of the lighter ones. An enlargement of the bill, particularly a tendency to be longer, also usually accompanies this darkening of the colors.

3. Birds bred in the high north are larger, in direct proportion to the latitude, than those bred at a far southern point.

4. Birds bred in South Florida have absolutely larger bills than the otherwise larger individuals of the same species born in the north.

The preceding laws cover the chief regional variations in our grouse and partridges; and in order to show the relation which they bear to the races named elsewhere, I shall describe the latter more in detail. First, as to the "quails," (*Ortyx virginianus*.) Taking for convenience the quails of the New England States as the normal standard, we can trace them from this point, their northeastern limit of distribution, towards the regions of extreme climatic differentiation, only in two directions, viz.: southward to Cuba, through the Atlantic States, and south-westward to Texas, through Kansas. Proceeding in either direction, we note that as we go southward the birds gradually get smaller; and that this change takes place in faster ratio and more abruptly in the Mississippi Valley than along the Atlantic States, for in Southern Illinois the quails much more nearly approach, both in size, relative proportion of different parts, and in colors, those of Florida, than do those from a corresponding locality on the Atlantic coast, as for instance, Washington city or Norfolk. This is probably the result of greater humidity, greater luxuriance of vegetation, and greater warmth of climate. On the Alleghany ranges in the same latitude, the quails are like those of the lowlands in New England. In Cuba the smallest quails are found, and with this extreme diminution of size is an increased intensity and extent of the black markings of the plumage, in accordance with a law pointed out by Mr. Allen, to the effect that colors intensify and dark markings increase in extent to the southward. Owing to its extreme differentiation, the Cuban quail was named *Ortyx Cubanensis* by Mr. Gould, but from the fact that the quails from South Florida are just intermediate between those from Cuba and those from Middle States, leads us to call it *O. Virginianus* var. *Cubanensis*. The Floridian bird has been named var. *Floridanus* by Dr. Coues, (see Key to North American Birds,) but it is a question whether a name founded upon one extreme differentiation can be allowed to stand.

From the Eastern States westward to the limit of the wooded region, the colors of the quails do not show any appreciable difference, until the extreme southern portion of Illinois is reached; there the colors as well as the size show a marked approach to the Florida style. On the prairies, however, the quails are appreciably grayer, with less rufous and black than those of the heavily wooded sections of the same region; and as we go westward we find this grayness gradually increasing until in Middle Kansas the difference from those of the prairies of Illinois is very strongly marked; and if we still trace the species southward, we find that the maximum grayness, and minimum amount of rufous tints, is reached in Texas. The Texan quail was described in 1853, by Mr. Lawrence, as

Ortyx texanus, the connecting links not then being known. But now, since we have become aware of the gradual progression between the two extremes as noted above, we call the light grayish colored quails of the Southwestern plains *O. Virginianus* var. *texanus*.

The American grouse likewise vary in colors and size, with habitat, but they being of more northern distribution, other laws are the agencies in working their modifications. Taking first the ruffed or drumming grouse, (*Bonasa umbellus*.) we observe that every individual killed in the south of Maryland on the Atlantic coast and anywhere in the Mississippi Valley, has the tail of an ochraceous rufous color, in bars of several shades; the prevailing tints on the body are also rufous. As soon as we go into the Alleghany mountains we begin to find a few with tails gray or inclining to be gray, and in proportion as we go northward the number of individuals having gray tails increases, and the grayness becomes at the same time more decided. In the New England States apparently every individual of the species has a gray tail. But all the birds of the eastern United States have rufous the predominant color of the body. Canadian specimens are like New England ones, but those from the interior of British America, and thence to the Yukon river in Alaska, are entirely gray, with little, if any, tinge of rufous anywhere on the plumage. Specimens from the Rocky Mountains as far southwest as the species extends, are like these northern examples, for the high altitude of their habitat is equivalent to the high latitude of that of the others. This gray form is the *Tetrao umbelloides* of Douglass, or the *B. umbellus* var. *umbelloides* of Baird. In the densely wooded region of the Pacific coast, in Oregon, Washington Territory, and British Columbia, the ruffed grouse are much more like those of the Southern States and Mississippi Valley than any other region, having like them rufous tails; but the colors are much darker and deeper, a rich shade of ferrugineous, mixed with chestnut, prevailing. Going from the coast back into the mountains, this form, (the *Tetrao sabiniei*, Douglass, *B. umbellus* var. *sabiniei*, Baird,) grades directly with var. *umbelloides*, first acquiring a dark gray tail and gradually becoming lighter and more ashey toward the interior range.

In the Rocky Mountains of British America, the *Canace canadensis* has also a representative race, the var. *franklini*, in which the tail is entirely black instead of tipped with rufous; and in the same localities the *C. obscura* has a race (var. *richardsoni*) differing in exactly the same particulars from the var. *obscura*. It is not known with certainty that the *C. canadensis* extends to the Pacific coast; but the *C. obscura* does, and the race found in company with *Bonasa umbellus* var. *sabiniei* differs from the var. *obscura* of the ranges inhabited by the *B. umbellus* var. *umbelloides* in darker, more sooty colors, and reddish wash over the back. The latter constitutes the geographical race var. *fuliginosa*. The *Orcortyx pictus* is represented on the Sierra Nevada, or the interior range of California, by the var. *plumifera*, in which the gray tints are lighter, clearer, and more bluish than in the race of the coast range, (var. *pictus*.) in which the ashey tints are much obscured by a smoky olive wash. The pin-nated grouse, or prairie hen, of the Texan plains, (*Cupidonia cupido* var. *pallidicinctus* Ridgeway,) differs from that of the Illinois and Louisiana prairies, in being lighter colored and more slender, just as do the quails. Of the remaining species of grouse there are left only the sage cock, or cock of the plains, (*centrocercus urophasianus*) the sharp-tailed grouse, (*pediacaetes phasianellus*.) and the ptarmigans, *lagopus albus*, *L. mutus* var. *rupestris*, and *L. leucurus*. The sage cock and the ptarmigans being limited each to one geographical province, no climatic races occur; but the sharp-tailed grouse, which has a very extended distribution, presents two well-marked forms. The var. *phasianellus* extends over the entire western and middle portions of British America, south to the northern shore of Lake Superior, on the east, and British Columbia on the west; northward, it extends to the shores of the Arctic Ocean. In this form the colors are simply white and blackish brown, the latter prevailing; while the toes are almost concealed by the long hair-like feathers. The var. *columbianus* extends south-

ward from the northern boundary of the United States, and spreads over the whole treeless region of the West, from the prairies of northern Illinois and Wisconsin to the ryegrass foot-hills of northern California, and reaches southward to a little beyond the parallel of 40° in the Great Basin. This race differs from that found further north, in much lighter, more ochraceous colors, and in naked toes. The first feature is due to the common law, giving birds of the arid, treeless districts, (of strong heat and reflection during the summer months, and an almost arctic winter,) lighter, more bleached colors than those of more wooded districts; while the nakedness of the toes is due to the fact that in their southern habitat they do not need the protection from cold which their northern brethren do.

ROBERT RIDGEWAY.

ROTATION OF FISH.

CAZENOVIA, November, 1873.

EDITOR FOREST AND STREAM:—

He who files and binds the FOREST AND STREAM will secure an amount of varied information concerning fish and game that collected from the observations of men in all parts of the globe, will, in time, be of infinite interest and value; and none of it will tend more to explode or confirm ancient and venerable notions than the columns so kindly given to correspondents who send for record the investigations made with regard to the peculiarities of game-birds and animals.

The question of snakes swallowing their young has been responded to with abundant confirmation, and if the mooted point, "Will bass take a fly?" is not authoritatively settled, let your present correspondent add the small weight of his testimony, in saying that fly-fishing for Oswego and black bass has long been one of his favorite amusements, although they are more eager for a spoon bait, or in mid summer, deem a grasshopper the tit bit most tempting of all.

A question of considerable interest may arise from seeking the why of what may be termed the rotation of animal life, to use the word as applied to crops.

It is well known that the numbers of any variety of animals vary greatly in succeeding years, and the same applies to birds. In some instances there are evident facts to account for the increase or diminution of certain species, as when a winter of sudden snows, or rapidly formed crust, causes the death of covies of quail and birds that are in the habit of collecting upon the ground; but there are great variations in cases where our present information affords no satisfactory reasons to satisfy our curiosity.

In fish we see something of the kind, but concealed, as they are, from observation, it is not easy to distinguish diminution in number from diminution in catch.

In the Lake at this place, there have been changes that may lead minds more familiar than your correspondent's, to some conclusions of interest.

When the Lake was first visited it was known by the Indians, Onondagas and Oneidas, by the name Onahgena, the "Lake of Yellow Perch." The waters of the Lake at the beautiful falls of the Chittenango, ("waters running north") go in one leap one hundred and forty feet, and although salmon came in those good old days when the cornucopia of nature held something beside bull heads and suckers, to the foot of this cascade, no fish came beyond; proving that unless the lazy Indians made their squaws plant fish, the yellow perch were original inhabitants, dating in occupancy from the flood, or from some of the glacial disturbances that have laid petrified sand beaches, with every ripple mark preserved, on our hill tops; the stones being from the Pottsdam group, one hundred miles north, and one thousand feet below the final resting place of the slab that tells how in the workshop of nature shifting sands are made a record of ages, while permanent rocks tell a tale of wandering. Living in less distinguishing numbers with the yellow perch, were the placid sucker, the dressy sunfish, and a few common pond fish; but there is no record of trout in the Lake, although they were abundant in the streams about.

Some forty years ago pickerel were introduced. The variety chosen as the best was from the Susquehanna, a brighter fish than the St. Lawrence cousin, with whom they now live in Onondaga Lake, having gone alive over the Chittenango Falls, and from whom they are favorably distinguished as more beautiful to the eye and more agreeable to the taste.

The perch held their own with these long jawed fellows, and both did well. Perch of one and two pounds were abundant, fine to catch and eat, while the pickerel were the aim of many an idler, falling victims to the seductions of minnows, frogs legs and, in later years, to the entrancing spoon. So far it was a well disposed community, when to add variety, Oswego bass, (a shade different from the black), were introduced, and they flourished until many a rod was bent double to their vigorous rush.

With them pike were brought, but they must have been the Kilkenny breed, for no record remains of any survivors among them. The pickerel were not sufferers, they never are, (and it is the only case on record where some one great pike did not also prove triumphant), but the bright banded golden perch were humiliated, and it is presumed were sacrificed to "the survivor of the fittest." A few small ones bit in retired coves on pin hooks, but they were no longer a power among fish—neither free nor equal.

For many years no changes were noticed. Three years ago the Fish Commissioners sent 8,000 salmon trout, which were placed in deep water, and one year ago 80,000 more, with 30,000 white fish, were introduced. The white fish

which do not take bait, will not be taken by nets, but are introduced experimentally to see if they and their spawn will not afford food in deep water for the salmon trout. How far this experiment will succeed, time alone can demonstrate. Black bass have also been planted, and a few wall-eyed pike—but they are still small.

There does not seem to be any cause in all these changes to effect the bass unfavorably, or the perch favorably, but the catch of the past season has been very small in bass, almost nothing, while the perch fishing is vastly improved, and many were taken upon flies by trolling them under water. Dead fish have not been seen in unusual numbers, and no good reason is given for the absence of the bass, so we are inclined to think there may be some such variation in their numbers as exists from year to year among squirrels, &c., &c. The water is one from which migration is practically impossible; yet, the usual amount of skillful fishing has been exercised in vain, and some cause must be sought beyond any known at present.

In this correspondence there are no conclusions, but statements of the kind may be so multiplied as to lead to some that may be valuable, and with this hope the statements are communicated.

L. W. L.

WILD TURKEY'S.

CUMBERLAND, MD., Dec. 1, 1873.

EDITOR FOREST AND STREAM:—

The game birds found in this region of country are the wild turkey, pheasant, partridge, woodcock, jack snipe, and several varieties of the duck family.

All sink into insignificance when compared with the noblest wild fowl that makes its home in the mountain fastnesses of the Blue Ridge and Alleghanies. I refer to the wild turkey. The proud step and stately beating of this bird in his native wilds, proclaim him the monarch of game birds in this section of country.

When full grown he averages probably twenty pounds in weight, and he not unfrequently is found weighing as high as twenty-five or six.

The plumage is very dark, nearly black in many cases, and glossy; the usual color is a bronze deepening into greenish black. The hens are duller in color than the gobblers.

A pair of turkeys raise from ten to twenty young in a season. So wary and watchful are they that it is seldom an opportunity can be obtained in which to observe them when in their domestic relations. Their habits are therefore unknown to many. Severe battles often take place between the gobblers to determine which shall be the happy spouse of some hen that watches without seeming interest the struggle going on for her sake. The victorious hero strutting proudly by the side of the well pleased hen, becomes so much excited over his victory that the red and white of his head and neck assume a deep purple. With tail spread to its utmost extent, and one wing sweeping the ground, an old gobbler presents a fine picture of self-satisfaction and pride. The vanquished gobbler does not write a letter admonishing his friends that he is so stricken with shame at his defeat, and so stricken with grief at the loss of his adored that to remain any longer on this mundane sphere would only be a strain upon his feelings and make him a burden of woe and grief to his friends. Such a reason as this having been given for his blind act he does not go to a lone and secluded spot where some giant rock overhangs a deep and boiling pool, and after having behaved himself in an insanely appropriate manner throw himself as a sacrifice to his selfishness into the waters below. No, he is more sensible than that. After his defeat he does some very fast walking to get out of the way of his successful adversary. This having been accomplished he busies himself in smoothing out his ruffled plumage and in covering the marks of defeat. Once more his "keouk" sounds through the forest inviting another fight or perhaps seeking a meeting with some other hen, and thus the war of the gobblers continues until all are mated and the theory of natural selection verified.

A spot in the far off mountain is selected under a sheltering log or jutting rock, the dried leaves and grasses of the last fall are scooped out, and in the hollow thus formed the eggs are deposited. During incubation the gobbler stays near his mate, and when she desires to leave the nest in search of food and to rest her cramped limbs he takes her place upon the eggs.

As soon as the young are hatched a spot easier of access is sought where the young birds may obtain food more readily. Both parents take great interest in the growth and progress of their young family. The wild turkey is more hardy than its domestic cousin, and the rains of spring and the early summer months affect the health of the young brood much less than our tame and domesticated varieties. A dry season is preferable for their rapid development. At one month old the real trials and dangers of the young family begin. At this age there is sufficient good eating in the young turkey to make the chops of Reynard water with delight, and the numerous hawks infesting this region are not insensible of the delicious flavor of wild turkey.

The young birds are exposed to the greatest amount of danger in the latter part of August and the first of September; they are then about the size of a common barn-yard hen, and are an easy prey for the hunter. A flock of half grown turkeys startled by the approach of any one will take immediately to the nearest trees, and can be shot one after another from their perches. This mode of slaughtering the poor birds is poor fun and a disgrace to a true sportsman. Five turkeys at that season will about equal one good one killed during the months of November and Decem-

ber. The two last named months are the ones in which the turkey ought to be hunted, and I would be much gratified if our Legislature could be induced to pass a law prohibiting their destruction (for so I must call it) at any other time.

In the morning after "the beautiful" has covered the ground to the depth of an inch or two is the best time to start upon a hunt for wild turkeys. They will then be actively searching for food and every movement and turn may then be traced in the snow. Great caution is necessary in approaching them; their sight is excellent, and their hearing good. Many a fine gobbler is lost by the cracking of a twig or the movements of the hunter. Every precaution should be taken to see as far ahead as possible without being seen. If provided with a turkey caller it is well every now and then to see if an answering "keouk" cannot be obtained. If the hunter be fortunate enough to get within shooting distance let him take deliberate aim at the head (if provided with a rifle). But the possessor of a shot gun should aim to cover the whole body. After being mortally wounded a turkey will frequently run or fly for half a mile, but in a straight line. And very many turkeys are thought to have escaped injury when by a careful search they might have been found dead a short distance from the place where they received the fatal shot.

As the cultivation of the bottom lands along our rivers increases the wild turkeys become more abundant. During the late civil war agriculture was at a stand still in this part of the country; the farmers raised barely sufficient to keep body and soul united, consequently the food of the wild turkey was diminished in quantity and there was a proportionate decrease in their numbers. But since hostilities have ceased and the fields are once more contributing the necessities of life, the wild turkey has steadily increased in numbers, and to-day or any day during the season dozens may be seen hanging in front of the restaurants and game stands.

I have spoken of a turkey caller, and it would not be doing justice to myself or my readers to close without describing this implement of the turkey hunt. The small bone from the wing of the turkey makes a very good caller by putting one end into the mouth and drawing the air through it, but the best one can be obtained by sawing about two inches from the end of a cow horn, then cut a piece of shingle so as to fit the small end of the piece sawed off, bore a hole in the middle of the shingle, and insert a stick about the thickness of a ten penny nail, allowing the end of the stick to come through the piece of horn and to project a short distance beyond the open end. Put the end of the stick thus projecting upon a piece of slate and the sound produced thereby is the best imitation of the "keouk" of a turkey known.

OBSERVER.

DEER HUNTING IN CANADA.

EDITOR FOREST AND STREAM:—

Being a subscriber for your valuable paper I thought a short account of a deer hunt among the rocks of Digby and Dalton would interest your readers. Our party consisted of four gentlemen and myself, accompanied by two deer hounds, named Bugler and Music, also a spaniel named Joe. We took along our tent and a plenteous supply of blankets and buffalo robes, also some stuff we commonly call "goose oil" which answers two purposes, one is to keep us from getting dry, and the other is to pour into our boots to keep the wet out. It was well into the small hours of the morning when we reached the camping ground and began to pitch tent and cut wood to make a fire. We had bad luck the first three days, although the dogs started some deer. On Saturday morning we made an early start and were all on our runways by day light. The dogs had not been long away before I heard their charming music. It did not last long, as bang went Donald's gun, and so did Hector's, and away went the buck for a point on Cranberry lake, where Charley was stationed. Bang went his gun and down dropped Mr. Buck; being shot in the head. After cutting him open and giving the dogs a feed, we started back to the tent taking the deer along with us. It was well on in the afternoon when we arrived there, but I took Joe (the spaniel) along with me, after some partridge, and before night set in I had been successful in bagging six brace.

Jim Salter came into camp, (he is a farmer and deer hunter) and some proposed still hunting; so on the next morning my friend Billy and I went with Jim. His directions were few and simple; he told me to walk quietly along the ridge, and Billy to take that one (pointing to the ridge a little farther on). After we had taken our latitude we all went into the bush, climbing over rocks, swales and gulleys. All went well for a short time, and then I heard my friend. "Hallo—Bob, come here." I found him sitting on a log, wet, dirty and swamping up to his waist. Bang went Jim's rifle three times (shoots a Henry) and brought down a doe, which we cleaned and buried in the snow until morning. We had hard work to get it into camp next morning, as the snow was two feet deep and not crested sufficiently to bare us. While we were away the rest of the party had succeeded in killing two buck fawns. During that night it was the first howl of the wolves that disturbed our rest. They must have come very near, as the dogs barked and howled gloriously and were much scared. Some of us looked out, but could see nary a wolf, only hear their infernal howl. No doubt the track of the deer that we had shot and buried, and the smell of blood, had aroused their insatiable hunger. Next morning on looking for tracks we found the snow trodden down as if there had been a fight.

Last day in camp we shot nine hare, and after we had all our traps and guns packed up a very fine big buck ran by the camp within thirty yards of us, but we were satisfied with what we had, so we did not slaughter for the sake of slaughter.

Our total game for ten days was three bucks, two does, two buck fawns, twelve partridges and nine hares.

TORONTO GUN CLUB.

WILD FOWL SHOOTING AT LITTLE EGG HARBOR.

EDITOR FOREST AND STREAM:—

It was my pleasure to enjoy a glorious two days' shooting the 27th and 28th of the past November. Our men engaged by letter were Hayes Jones, (in my estimation the best honker of geese at Tuckerton), and Joe Shords, almost his equal.

A tedious journey via Pemberton and Heightstown, New Jersey Southern & Tuckerton Railroads, from Philadelphia, landed us at Tuckerton at 4 p. m., where we had arranged with Captain Burton to sail us to Long Beach with our baymen. Getting under way at the landing two miles up Tuckerton Creek, we drifted with our sneak boxes astern, as far as the cove at the mouth, and found not a breath of air steering and a poorer prospect of any before morning. A council of war was held, and it was decided if we wished to reach Captain Bond's on the beach that night, we should have to row our sneak boxes over. It was a long pull of seven miles, and on a cold still night with the ice making on the coves, it proved no child's play. Our row was enlivened now and then by the quack! quack! of the black ducks feeding on the meadows, and the coarse gabble of brant as they winged their way overhead unseen by us. As it always is, the last half of a journey so wearisome as the present one was, proved the longest by far, and it was not until we saw the faint glimmer of the light in Captain Bond's window that we knew rest was near at hand. The north-west winds of the two previous days had so blown the water out of the Bay, we found our boats had to be anchored a full hundred yards from the shore, and guns, baggage, ammunition, including ourselves, to be carried to the main land, our baymen taking each of us "pick a back," as we had not as yet donned our shooting boots.

At Bond's we found two gentlemen, Messrs. J. P—o and M. W—d, with their duckers, Sam Shords and Sam Smith busy at old sledge. They were at the beach trying the brant—and we felt disappointed enough when we were told that they had not, as yet, in the two days they had been on the Bay, gotten a shot—the north-west wind interfering with the flight of the fowl, and driving them in their migrations outside the beach on their way south.

Proposing a game, we all drew our chairs around the table and a jolly good time was indulged in. It must have been twelve o'clock when we bundled to bed to dream of brant and to hope the wind would open in the morning any way but from the north-west.

We were up before daylight and taking such a breakfast as only Captain Bond can give, we found it had been agreed upon by our baymen and those of P—o and W—d that we should decoy from "Goose Bar" the first day, they taking the "bunches," and vice versa the second day, the two best locations in the line of flight of fowl going south, a preference being given to the bunches a mile to the north of Goose Bar. The wind proved more propitious, blowing fresh and cutting from the north—and a row across the channel a laborious and rather dangerous undertaking in our little sneak boxes loaded with decoys. Our crafts rode the sea beautifully, and it was not long before we were making our hide and arranging our stools. Goose Bar is merely an island covered with sedge two or three feet high, into which we pulled our boxes and covered them with such trash as was near at hand.

As the tide rose higher we began to see black head ducks, widgeon, black ducks, and sprigtails shifting their feeding grounds to more shallow water; and as they passed us they invariably darted to our decoys, making capital shooting; but we had come for larger fowl, and eagerly awaited the coming of geese and brant.

We were sitting upright in our boxes when Dad quietly, but excitedly whispered, "Down! down!" and looking to my left saw six geese heading in the direction of our stools; they were inclined to be sociable, for they answered "Dad's" honk! e-honk! and lowered their flight; but the leader of the flock, a venerable old gander, and tough, as he proved to be, "had been there before," and led his followers three hundred yards from us, where they settled and began feeding—the same old gentleman acting as sentinel, never putting his head under water while they fed. Our hope now was that they would feed towards us, but as the tide was setting the other way they appeared to be drifting the opposite direction. We had almost determined to start them up, trusting they would go to the "bunches" and thus afford shooting for our friends, when they began boldly to swim towards us. As they drew nearer, swimming, "company front," the old gander on the right, still suspicious but unwilling to leave his younger company, I had a splendid view of them, patiently waiting for the word to shoot. Hayes' judgment of distance and knowledge of the shyness of the wild goose, was perfect; for as they neared the outer decoys, they discovered the cheat and the word was given—"Boys, let's kill some of them."

So closely huddled was the flock as they rose, five were shot down; the gander, with his thigh broken and leg hanging, going fifty yards before a spare gun could knock him over. Ten minutes after we had gathered our geese, we saw

a second flock of ten coming towards our friends at the "bunches," but they would not stoil to them and appeared determined to take the line of the beach; and it was then that I saw the best specimen of "talking to geese" it has been my lot to witness.

"Dad" seemed determined to have those geese come to us; and as he threw up his head and opened his mouth to bellow his honk! honk! e-honk! one could almost imagine his box contained a human goose, feathers and all. The flock replied, and "Dad" talked them within long gun shot, when an unlucky thumping of my boat shied them. We gave them a volley nevertheless—but they passed on seemingly untouched. When they had flown quite a mile one of their number suddenly dropped into the Bay, which we recovered and found dead.

Brant now paid frequent visits to the bar, leaving each time some of their company; and towards afternoon broad bill, black duck, widgeon, and red heads again darted to our decoys, as they passed up and down the Bay. Satisfied with our day's sport we took up our traps at sun down and pulled to the landing to find P—o and W—d quite as successful as ourselves.

We repeated our sport the second day and fared quite as well—making a large bag of fowl—returning to Philadelphia benefitted by our trip and thankful we had the pleasure of meeting so genial gentlemen as Messrs. P—o and W—d.

"Homo."

THE FISHING TOURIST IN AMERICA.

THE following notice of the Fishing Tourist, by Charles Hallock, Editor of the FOREST AND STREAM, appears in the last issue of the London Field, and is undoubtedly written by Sir Francis Francis, the editor and proprietor of that most excellent journal. Approbation from so distinguished an authority as the London Field is indeed most grateful:—

"A few weeks back, we suggested that a great desire existed for a guide-book to American fishing localities, little thinking that our wishes were so near being gratified, and that our suggestions had been anticipated. Here is the very book we wanted. Mr. Hallock has devoted a large portion of his life, from boyhood up, to wandering about America and Canada from fishing place to fishing place, and he gives us the benefit of the information he has obtained. Beginning with the best known American waters, viz., those of Long Island, Mr. Hallock rambles onwards to the Adirondack wilderness, tracking along from stream to stream and lake to lake, thence to the Alleghanies, and away to New England and the Schoodic lakes in search of the famous land-locked salmon, and so to Nova Scotia, Cape Breton, New Brunswick, the Bay of Chaleurs—touching upon river after river and lake after lake, dwelling on some, skimming over others—thence reaching the Lower St. Lawrence, the Saguenay, and Newfoundland, and even to savage Anticosti and far Labrador—Mr. Hallock contriving to give us some information about each. Turning back again, he touches on the Ottawa district, the great Lake Superior region, with Minnesota thronged with lakes, which in turn are thronged with black bass; "The Big Woods," and parcel of "the Pacific slope;" winding up with an account of the Blooming Grove Park scheme, and a few facts in the matter of natural and artificial propagation.

This is a wide platform, but Mr. Hallock covers it fairly; he is never wearisome on the one hand, nor rhapsodical on the other. He sets himself a pretty long task, and endeavors to fulfill it as pleasantly as the subject will allow, and time and space admit of. Here and there, when Mr. Hallock does stop and cast a fly, it is plain to see that he is a thorough and accomplished sportsman, and a warm worshipper of nature, with a keen eye for the picturesque. If in describing his experiences he now and then employs that quaint method of expression which appears to be inseparable from a thoroughbred American, he never descends to vulgarity; but his book is eminently that of a gentleman as well as a sportsman—qualifications not always combined, either here or in America; and though his feats of fishing frequently make one's mouth water, it is plainly to be seen that there is little or no exaggeration in them, and no attempt at boasting. There is no throwing of impossible lines, and doing impossible feats—no casting of thirty odd yards with an 8oz. rod. So far from this, Mr. Hallock keeps rather at the other end of the scale, and speaks of having seen twenty-five yards cast from a 17ft. bamboo rod, as though it were rather a feat; whereas we expect greenheart to do that much habitually, though a 17ft. rod is rather shorter than the generality of experts employ with us. Altogether Mr. Hallock's is a very useful book.

Near home, and in the more approachable places, he gives the cost and the routes also, with the best hotels, and much other useful information. The American lakes and rivers appear to be thrown open so far that big hotels are built on the most favorable spots, and they are converted into watering places, where the gentle sex as well as the sterner one all turn piscators alike, and a continuous picnic under canvas with a fair allowance of muslin appears to be the method in which much of the trout fishing is practised. This may be all very well; but we confess that we do not look upon it, taken thus, as a contemplative man's recreation—unless, like Tommy Moore, one is prepared to admit that

My only books
Were woman's looks,
And folly all they taught me.

There is excellent trouting to be had, but the salmon fishing in America has been so cut up by commerce that Nova Scotia, New Brunswick, and the lower St. Lawrence are the chief refuge of the New York salmon fisher. Of the splendid rivers which thread the wildernesses in all directions Mr. Hallock speaks in the warmest terms of admiration. Many of these rivers have been damaged by inconsiderate treatment; but since 1868 the Canadian Government have taken them in hand, and the stock of salmon, reduced to almost nothing in many of them, is being largely increased again by proper care and management, and the rivers are of course vastly increasing in value. As this occurs, the rivers are leased out by the Government to various persons, many of them being let to American gentlemen. Mr. Hallock regrets the old time when any one could cast a line and catch a salmon where and when he liked,

But he should not forget that it was the very existence of this free and easy custom that tended to reduce the rivers to the fishless condition they were in previous to 1868, and that the Government cannot be expected to watch, protect and restock rivers for nothing. We cannot, unfortunately, combine the freedom of savage life with the comforts of civilization; one surely destroys the other sooner or later. Still it is a great comfort to know that the fisheries are being so much improved, for we have always taken much interest in these splendid rivers.

Mr. Hallock often speaks feelingly of the dreadful drawback to the comforts of fishing on the Canadian rivers experienced in the swarms of mosquitoes and black flies. Midges are troublesome on some Scotch moors, but they are a trifle to the torments inflicted on the angler by the mosquitoes, and particularly by the black flies; and it seems difficult, if not impossible, to provide any system of prevention. Ammonia may bring a little consolation but thin-skinned people will do well to think twice before they go out to Canada for the salmon fishing.

We may here take occasion to say that writers on American angling appear to be very active and assiduous just now; books throng from the press in rapid succession, and American angling literature grows apace. We must look to our laurels in British angling literature when such writers as Mr. Hallock come to the front. No doubt there is much that is new to write about on American fishing, while our own does not leave many channels unexplored. We are very glad to welcome so well written and useful a book as Mr. Hallock's, and look upon it as decidedly the best work of its class which has come from the Atlantic; it is one that every Englishman, contemplating a visit to America for the fishing, will do well to provide himself with. We do not see the name of any English publisher or agent on the title page, which seems to us rather an oversight. The book, however, can be got by order through either Messrs. Trübner or Sampson, Low & Co.

CRABS—A ROMANCE.

WHAT follows is rigorously exact in every detail, as it comes almost directly from Jones, who was the hero. I do not think there ever was a keener naturalist than my friend Jones, and his paper on the *Cirrhipeds*, or Barnacles, read by him before the Association of Scientists has, no doubt, been fully appreciated by the readers of the FOREST AND STREAM. Jones' peculiar line of investigation is the study of the crustacea, and some intricate questions in regard to the development of the *Podophthalma* have absorbed his attention for the last five years. All the information I have on these subjects are derived second-hand from my friend. From him I have discovered there really is a Fast Crab—a Racing Crab, which has to be run down on horseback and shot on the jump, like an antelope, for Jones went to Ceylon for no other purpose than to study the *Ocyrops cursor* on his native heath.

Baltimore is famous for its crabs, and there having appeared there this summer quite a new variety, Jones traveled two hundred miles after them, and was fortunate enough to secure quite a lively collection. With his novel specimens safely secured in a basket well lined with fresh sea weed, Jones delighted, proceeded homewards. Driving to the depot he took his place in an omnibus along side a very pretty lady, the two being the only occupants of the vehicle. The two passengers had not gone far before the lady commenced looking daggers at Jones, who is the most high-minded, chivalrous and courteous of men. Somewhat astonished at her scornful glances—nay, even abashed at her fiery mein, Jones humbly demanded of the lady the cause of her anger.

"You are an insolent puppy, sir!" cried the lady, in a rage, and accentuated her remark by the application of a sounding box on Jones' ear.

Jones, driven to desperation, still asked for further explanations.

"To-to-have-had the impertinence to-to-have pinched me!" said the lady, bursting into a torrent of passionate tears.

Poor Jones hung down his head abashed. Just then his eyes happened to light on the basket, which to his horror, he found was wide open, and on examining the matter more critically he discovered quite a cavalcade of crustaceans careering along the cushions of the 'bus. The lady looked too, then smiled a smile of forgiveness—but Jones? It was a long time before he got over it. Evidently the lady was distressed at her mistake, and at first timidly, then with great dignity and sweetness murmured a most formal apology. Then Jones was utterly wretched, and wanted to throw every crab out of the window, which the lady declared she could not allow, for as she prettily remarked, "she doted on crabs—boiled." It was a charming sight to see how dexterously the lady, with her umbrella, would corner a crab, and how merrily she laughed when Jones, with all the skill of a naturalist, would pick up a peculiarly vicious crab and plump it back in the basket. Need we say that Jones left the lady, blessing the crabs, which had been the happy accident of causing him to make so charming an acquaintance? But why waste words? Of course they met again, and they were married a month ago. When I last dined with them and I handed the pretty Mrs. Jones a *mayonnaise* of crabs, I saw her glance at her husband and blush redder than a boiled crustacean. I was on sufficiently intimate terms with Jones to have asked for an explanation, and the above was what was told to

SHREWSBURY.

—A Western paper tells the story of a country-woman who made her first attempt to get in the Court house yard through the patent back-action gate. She opened the gate, went through, as she supposed, and shut herself out on the same side seven times; then, ejaculating "merciful sakes," climbed over the fence.

—Leather, chemically considered, is the ox-hide of beef

THE ANGLER.

THE gallant fisher's life,
It is the best of any,
'Tis full of pleasure, void of strife,
And 'tis beloved by many:
Other joys
Are but toys,
Only this
Lawful is,
For our skill
Breeds no ill,
But content and pleasure.

In a morning up we rise,
Ere Aurora's peeping,
Drink a cup to wash our eyes—
Leave the sluggard sleeping;
Then we go
To and fro,
With our knacks
At our backs,
To such streams
As the Thames,
If we have the leisure.

When we please to walk abroad
For our recreation,
In the field is our abode,
Full of delectation;
When in a brook,
With a hook,
Or a lake,
Fish we take:
There we sit,
For a bit,
Till we fish entangle.

We have gentles in a horn,
We have paste and worms, too,
We can watch both night and morn,
Suffer rain and storms, too;
None do here
Use to swear,
Oaths do fray
Fish away;
We sit still,
Watch our quill,
Fishers must not wrangle.

If the sun's excessive heat
Makes our bodies swelter,
To an osier hedge we get,
For a friendly shelter;
Where in a dike,
Perch or pike,
Roach or dace,
We do chase,
Bleak or gudgeon,
Without grudging;
We are still contented.

Or we sometimes pass an hour
Under a green willow,
That defends us from a shower,
Making earth our pillow;
Where we may
Think and pray,
Before death
Stops our breath;
Other joys
Are but toys,
And to be lamented.

JOHN CHURCHILL.

In "Library of Poetry and Song."

A CANADIAN ON RIFLE SHOOTING.

WE take great pleasure in producing a most interesting letter, which will be fully appreciated by our riflemen. Its author is a distinguished member of a leading Canadian Rifle Club:—

HAMILTON, ONTARIO, Dec. 12, 1873.

EDITOR FOREST AND STREAM:—

Having attended the first meeting of your National Rifle Association, I take a very great interest in reading your reports of Creedmoor and of the different matches held there, and I am pleased to notice the great improvement your marksmen have made in a short time in the use of the rifle. I have attended since I have lived in Canada numerous opening matches of Rifle Associations, but I must say that the matches at Creedmoor, N. Y., were better conducted, and the shooting at least equal to any that I have seen in the Dominion. Great credit is certainly due to the several gentlemen who had the organizing of the Association, and who have carried out their arrangements so well. I do not mean to say that all was perfection, for that is not to be attained at a first rifle meeting; but it was all that could be expected. There were a few mistakes made which you will no doubt obviate on acquiring experience. I will mention one or two. I noticed on several occasions men firing at targets when markers were painting the adjoining ones with danger flags up, which is very dangerous, for the bullets after striking the target fly in pieces on each side, and it was a wonder to me that the matches terminated without an accident. Another mistake I think was committed in the small bore matches, (or, as you term them, sporting rifles), and that error was in shooting them from the shoulder. We did the same thing at the opening matches of our Dominion Rifle Association, but have now given it up. Long range rifles are not made for shoulder shooting, and although in England and Scotland they have matches at the short distance of 200 yards with them, they, on all occasions, shoot in any position. In Canada we seldom have matches with small bore rifles at any range under 500 yards. In your paper of November 6th, in your comments on the match of the Amateur Rifle Club, you make some mistakes which you will pardon me for correcting. You say, "Mr. Omand having been a member of the Victoria Rifles of Montreal, and one of the winners in the match for the Rajah of Kolapore Cup in 1870," and so forth. Now, Mr. Omand was never a member of the Victoria Rifles of

Montreal, but was a member of the Victoria Rifle Club of Hamilton, and the Kolapore Cup was first competed for by Canadians at Wimbledon in 1871, twenty men on each side, at 200, 500 and 600 yards. On that occasion we were beaten by somewhere about fifty points, but, in 1872, we picked our eight best men and shot eight men a side and beat the united team of England, Ireland and Scotland by eight points. You also make a comparison of the shooting in your matches and the shooting for the Kolapore Cup, but you must recollect that they shot with the Snider Military Rifle, with open sights, whereas the Amateur Club shot with sporting rifles, finely sighted with aperture front and back sights. Now, that makes a great difference indeed. From what I saw I feel perfectly satisfied that the Remington Sporting Rifle is at least equal to the Rigby or Metford Small Bore Rifles, which are the best long range rifles that we know of. I think it is a mistake to exclude muzzle-loading rifles from shooting in your badge matches, or any other. It is the best way to test the merits of both kinds of rifles by shooting them along side each other. You must not think by my above remarks that I have any intention of trying to diminish the credit due to your marksmen. Far from it; they certainly have improved in a most wonderful way in the short time they have been practising, and deserve great credit. I see by some remarks in your paper that you do not approve of giving money prizes at your competitions, for the purpose of keeping out a spirit of gambling, which is perfectly correct, if it would have that tendency; but experience proves, both in England and Canada, that such is not the case; for where there is no chance of cheating there is no danger of gamblers' competing. If you do not offer money prizes your competitions will be confined to men who have the means and time at their disposal. Now, I presume the gentlemen who have so magnanimously worked and organized the National Rifle Association had some nobler object in view than getting it up for mere pastime. I have no doubt their intentions are that it shall be an institution for teaching your young men, whom you would expect to fight your battles, the practical use of the rifle. It is necessary for me to tell you that there are thousands of such men, who, for want of means, would not be able to give the necessary time for practice, and consequently would not attend your competitions at all; whereas, if there were any chance of their being able to pay their expenses by what they might win in money, they would be far more likely to take an interest in rifle practice, and in a military point of view, your country would be all the stronger. I also see some remarks about spirit levels, plumb balls, &c., &c., for the very necessary purpose of keeping the rifle perpendicular when shooting. In Canada we have gotten over experimenting on those things. I see by your columns that one gentleman suggests a pendulum hanging loosely from the back sight with an aperture in it, which is a good idea, but for the one objection of its being impracticable on a windy day. It would keep shaking back and forward and would disturb the eye of the marksman. We have tried a great many plans to keep the rifle plumb, but all methods have failed, save by using the spirit level, which suits the purpose better than any thing we have tried. So far as the danger of the spirit levels getting broken is concerned, that depends very much on the way they are fitted on. I have made mine to slip on the foresight and move along with it, when I shift for wind, so that it is always in a direct line with the sight, and does not disturb the eye when sighting. It can be taken off and put on in a moment without any trouble. I have used it for over five years, and it is not broken yet. The same amount of care which is necessary to protect the sight will also protect the level.

Yours, very truly,

SHOOTER.

THE MULE DEER—OR *C. MACROTUS*.

THIS species of deer is better known among hunters as the black tail, or red deer. It ranges from Western Missouri to the snow ranges of the Rocky Mountains, and is a very numerous species. During a five month's hunt in Colorado, I did not observe a black tail, or Virginian deer, although the *C. Macrotus* were seen in considerable numbers. The does of the Mule Deer are found throughout the foothills the whole year, but the bucks retire to the highest mountains in the spring, where they remain until about the first of October. While on the mountain tops they collect generally in small bands of four or five, though I have seen seventeen bucks in a herd. While in the vicinity of Taylor's Fork, Colorado, I had a fine opportunity of watching them in their natural haunts. They are generally found near timber line, in the heat of the day, but in the morning and evening they leave the shade of the forest and go further up the mountains to the grassy tops, to feed on the young rich growth which is nourished and fed by the water from the snow banks on the mountain peaks. When thus feeding, it requires the utmost skill of the hunter to approach them within shooting distance. I have watched a band of bucks feeding far above timber line until they gradually approached the forest, where I could find sufficient cover to crawl near them unseen and obtain a shot. When one deer is killed in a band and is seen to fall by the others, they often run in a body a short distance from the slain buck, and halt, looking back at the point of danger, standing as still as a statue, with their large ears brought forward to catch the slightest sound. If nothing is seen in a few moments they wheel about and gallop away to the nearest timber, when they are soon lost to view. When shot at in the forest, they retreat at a furious rate, often falling over fallen tim-

bers, and crashing through thickets, making the dead sticks crack and fly in every direction. They sometimes charge directly toward the hunter, and on one occasion I "dropped" a buck within twenty feet of me with a second shot, which was passing with several others. The scent of the Mule Deer is very keen, and it is useless to hunt them to "leeward" as they will smell the approaching hunter, and bound away, long before he is near enough to sight them. They are remarkably sharp sighted, and are constantly on the lookout for danger, particularly the does when they have their young with them.

When a band is resting, they lie down within a few feet of each other, doubling their fore legs under the body, and in wet weather they dry their coat by licking it with the tongue, in the same manner as a dog. I once observed a band of seven bucks, during a shower, which were lying under a large spruce tree, within fifty yards of my concealment. They were lying so close together, as nearly to touch each other. After watching them about five minutes I shot one of the largest. When receiving the ball, it jumped up, and immediately fell down again, and in so doing, tripped one of the passing herd, that went tumbling down a steep hillside, but soon caught its footing and bounded away after the rest of the band, with the speed of the wind. The bucks often return to their "beds," sleeping in the same place several nights in succession. I have surprised three bucks several times in their favorite resting place, which was on the decayed remains of a large log that had crumbled to pieces, thus making a soft and dry bed.

The Mule Deer has generally one fawn, though sometimes two. The fawns are prettily spotted with white and become quite strong and active a few days after their birth. When a doe first has her fawns, she remains in the thick swamps and under-bush for several weeks until her offspring are able to keep up with her when running from danger.

The flesh of the Mule Deer is superior, as meat, to that of the Virginian deer. The *C. Macrotus* is larger than the white tailed deer (*C. Virginianus*) and it requires considerable strength on the part of the hunter, when on level ground, to lift a full grown Mule Deer up on to his riding animal, behind his saddle, when it has just been killed and in a limsy state.

PROF. F. V. HAYDEN, in charge.

SKETCHES IN FLORIDA.

THE ENVIRONS OF TALLAHASSEE.

THE City of Tallahassee, the Capital of the State of Florida, is situated in Leon County, about thirty miles north of the Gulf of Mexico, and half-way between the eastern and western limits of the State. Tallahassee is an Indian word, and signifies "old fields." The present site of the city was perhaps long ago the cornfields of the savages. It is situated upon the broad, flat top of a hill, and is about a mile in length, by three-eighths in breadth. Its people are hospitable, refined, polite, and very sociable; and the stranger visiting there will receive more attention than at any other city in the south. It is a very paradise for bachelors, on account of the number, the beauty and the charming manners of the ladies. The climate is very pleasant, and the number of soft, warm "Indian summer" days during the winter, is very great—and, though a fire is necessary in the evenings, yet, during the day the visitor can remain almost entirely in the open air with comfort and pleasure.

To the sportsman, the prospect is admirable. In every direction, for miles from the town, are wide fields, which swarm with quail. A fair day's shooting—allowing the sportsman to take his breakfast at a reasonable hour, and start leisurely, returning for supper at dark—for a good shot, and with a good dog, is not less than from sixty to one hundred and forty birds. The covies are all large, and often two or more are found in one field. In the neighborhood of the town are many small lakes, in which duck and other wild fowl are plentiful. While at Lakes Lafayette and Jackson, six miles distant, and some miles in extent, there is good fishing as well as good shooting. About two miles from town, and on a high hill, which lies between several small lakes, is a favorite resort for duck-shooters—as the birds are continually passing and repassing from lake to lake. There is abundance of accommodation in the city, and the young gentlemen take pleasure in giving the sportsman all necessary information and assistance. Horses and vehicles are readily obtained. Deer are often killed within a few miles of the town, as well as wild turkeys.

St. Mark's, but an hour's ride from the city, by rail, is on the Gulf; and the fishing and wild fowl shooting is of the best. Boats and assistants are easily had.

One of the pleasantest trips, is a visit to the famous Wakulla Spring—which lies about sixteen miles from Tallahassee, almost due south—and out of which flows the Wakulla River, a stream a hundred feet wide, and three feet deep, with a two mile current where it leaves the spring. The route, with the exception of a few miles near Tallahassee, is through the pine woods, which extend to the very edge of the spring; though, as the ground begins to fall, there is a considerable intermixture of other varieties of timber, and a heavy undergrowth. The Wakulla Spring is about fifty yards long, by seventy-five broad, and is famous for the transparency of its waters. Floating in a boat on its surface, one seems suspended in mid air—and, when the day is perfectly calm, the water smooth and the sun bright, the illusion is perfect. The ordinary depth of

the spring is eighty-five feet and objects on its bottom can be seen almost as plainly as if held in the hand. Visitors usually take with them small, round, bright pieces of tin, which appear like tiny mirrors lying on the bottom, which is smooth and covered with a fine white sand. On the western side is a broad ledge or cliff of rock, the top of which is sixty-five feet below the surface. At the edge of this cliff the water is black, and I found bottom at a little over one hundred and twenty-five feet. Out of this Gulf the stream seems to gush, and one can see the fish floating over and in front of it, steadily maintaining their position—though the somewhat quick motion of the fins and tail show the resistance they are obliged to overcome.

The water is impregnated with limestone, and is icy cold. One or two persons who have experimented in swimming in this spring, after a few seconds immersion, became so benumbed as to require assistance to get back into the boat. The sides of the spring are very steep; being almost perpendicular for some distance below the surface. The river leading from the spring is full of grass, and among this lie the fish. Fishing with a line is out of the question—but many are caught with a "gig."

There is a legend connected with the spring, which goes on to say that many years ago, long before the white man trod the shores of America, this spring was a little fountain, and was the favorite resort of a pair of mastodons. One day while standing at the spring, cooling themselves by throwing over their backs "trunk-fuls" of the icy water, the ground suddenly gave way beneath their feet—and the ill-fated pair found themselves swimming in a lake of ice-cold water. Terrifically they "trumpeted," and frantically they strove to clamber out upon the bank—but the steep sides afforded no foothold—until benumbed and overcome with the cold, and feebly struggling, they sank, with their trunks lovingly entwined, to rise no more. As my fair informant remarked: "lovingly they had spent their lives together, and in death they were not divided." The bones of the ill-fated pair remained long at the bottom of the spring—a memento of their fidelity and their fate. Some years ago, some enterprising individuals succeeded in getting out their skeletons, which were large and perfect, and shipped them to New York. The vessel was wrecked during the voyage and they were lost.*

The country around Tallahassee is attractive and beautifully undulating. There are many fine views, and pleasant drives in almost any direction. All the varieties of forest vegetation peculiar to the country, are abundant. The superb magnolia, with its glossy deep-green leaves and large cream-white flowers, the bay-tree, the live oak, so famed for ship timber, the scarlet oak, the sweet gum, the sycamore, the long-leaved pine, the catalpa, the hickory, the beech, the wild plum and crab-apple, of size almost incredible until seen, the dogwood whose large, white flowers and berries of vivid scarlet far exceed in size those of its northern compeer—grape, and other vines of every variety and size; the yellow jessamine, which climbs the trees and overspreads their tops with its clusters, and hangs in graceful festoons from every branch, in a wealth of floral profusion which illumines its surroundings, and covers its forest supporters with a crown of glory. Along the fences and hedges the Cherokee rose, (I may tell you its legend some day), clambers in wild luxuriance—its fair snow-white blossoms shining like stars in the dusk of the evening, as you ride along. The oleander, the cape-jessamine and the crepe-myrtle, puny shrubs and hot-house plants at the north, here are trees, and grow to the height of twenty feet. The camelia, too, reaches the height of ten feet or more, and, living in the open air, blossoms with a luxuriance unknown to its sisters of the northern conservatory.

But why say more. The lover of the rod and gun keenly appreciates all of nature's loveliness—and where is the beauty and delicacy of God's handiwork more manifest than in the "Land of Flowers?" MONMOUTH.

*Chas. Lanman, Esq., in his "Wilds of America," says that the bones referred to were sent to Philadelphia by Geo. S. King, of Florida, and deposited in the museum there.—Ed.

—Several months since a store boat sank near the little town of Reno, Indiana, which had on board among other things several kegs of powder. One keg was carried up to Mr. Galey's and kicked around the yard for several days, but at last the inquisitiveness of Mr. G. overcame his accustomed prudence and he determined to experiment upon the keg. The powder had caked and become, to all appearances, a solid mass, but was in fact streaked all through with little veins of dry powder, which the water had affected very little. Mr. G. applied a torch to the mouth of the keg, and after considerable scraping and poking, the fire took hold a few seconds before Mr. G. let go. The keg made a puff like an infant Vesuvius, and bounded up the hill like a frightened coon—endwise. It puffed and smoked a few moments, when it made another spring into the air, turned over several times, and made straight for Mr. G., who by this time became somewhat frightened and began to yell for water. This roused the entire family, and while Mr. G. and his eldest son were vainly endeavoring to capture the keg, and kept busily avoiding it in its peregrinations, the other members were busily heaving bucketful after bucketful in the direction of the kicking keg. One bound, more lofty and vigorous than any of the preceding ones, carried the keg to the top of the house, where it whizzed and buzzed behind the chimney, until finally it rolled off and landed just in front of Mr. G., who sprang astride the smoking thing and yelled for more water. It came. Bucketful after bucketful was thrown upon the man and keg as they rolled over and over the ground, filling the air with smoke and soot and cuss words, until the fire in the keg and curiosity in Mr. G. were both totally extinguished. The bare sight of a powder keg is sufficient to cause a cold streak to run down Mr. G.'s spinal column.—*Ex.*

—The oldest timber in the world is in the ancient temples of Egypt. It is 4,000 years old and perfectly sound.

Woodland, Lawn and Garden.

WINDOW, OR PARLOR GARDENING.

THE HALF DOZEN PLANTS.—No. II.

"Bright gems of earth, in which perchance we see
What Eden was—what Paradise may be."

WE often hear it remarked, in relation to plant cultivation in rooms in the winter months, that Mrs. Flora, or Mrs. Pomona, or Miss Barefeet always has a bright and lovely stand near her front windows always bright and glowing with green leaves and flowers. And quite often our fair questioners ask, "Why cannot I have as fine a variety of rare plants in my room as Mrs. Laverder?" You can do so, and we are disposed to give you a few practical hints of how to begin in order to be successful.

Beginners frequently make a mistake at the very outset. They quite naturally suppose, after looking at a finely arranged, thrifty window garden, that this is all very easy, and they have only to go and do likewise, and have as fine a show as their friend. Very well; so they will, *provided* they take the care, and notice every little requisite that they will find they have overlooked. We do not wish to discourage our lady friends from the pleasing amusement of window gardening, but we wish them to understand in the beginning that from the most simple elements the most beautiful combinations and gratifying results may be obtained.

As you have constituted me your mentor, you must follow as I lead. You must in the first place make up your mind that were you to attempt the stocking and culture of a large number of plants with complete success you will assuredly fail. First attempts generally fall far short of our anticipations. You must try and fail, and try again, to a certain extent, and if you lose in plants you will have gained in knowledge what you have lost in plants. Gardening, and window gardening in particular, like all arts, requires practice, self-reliance, and careful observation; every little thing tells in the window garden. A lady said to me, "O, the many, many failures I have made in my attempts to cultivate good flowers! I have made such sacrifices to cash, time, and patience that I think I should succeed, if only to reward me for my patience." "Have you not obtained your reward in the knowledge you have obtained under difficulties? Does not this beautiful passiflora, that so gracefully twines its blossoming branches, covered with flowers, alone compensate you for all your time, money, and observation, your study and patience? Is not this one splendid plant a reward in itself sufficient for all your pains?" "Most truly, and now I can cultivate every plant I attempt to place in my window, for I have learned never to attempt impossibilities." This is my second point of consideration—never attempt to cultivate plants or flowers you *know nothing* at all about. True, you will have failures in the beginning; you must have, but remember, you will have success in the end.

The most essential requisites to window plant cultivation is a knowledge of the proper appliances. Take as an illustration of our subject, its simplest form. You have one window which you propose to make into a window receptacle of plants, flowers, &c. We will suppose it to be an ordinary window only. This window is to be fitted with shelves to receive your pots, and in the first place you will quite probably place a board upon the window sill, on the inside, of eighteen inches width. This is for your bottom shelf, and upon this shelf you will place your larger sized pots, and you will place them as near to the glass as possible, in order to give them all the light and heat possible from the outside as well as inside of the room. About three or four shelves is as many as I would recommend to begin with, and one shelf of six good pots is better well cultivated, thrifty, and, as I expect from you, understandingly, than a full shelf of meagre starvelling, as unsightly as undesirable. If you prefer, instead of pots you can have a neat bed made, of the requisite dimensions to place on your shelf. It is a good plan.

Full light and open air are loved by plants; one they must have all the time, the other occasionally. With such a window, arranged in this manner, suppose you begin with one shelf of six pots, or a single long box of earth. We think you could do yourself credit with these preliminary instructions, for they are as the stepping stones across the brook. If you would ford the stream you must look carefully to the way marks. If the window is fitted with double sash, or a recess between the outer and inner sash, so much the better, but of all these progressive arts we shall inform you as you are prepared to receive the necessary practical instruction.

You will observe that in the first attempts at window gardening on a small scale the great principles of heat, light, moisture, air, earth and soils, in elementary or primitive parts, and their compostings, are to be thoroughly considered. First—heat, the mover and great motive power, is to be supplied as the plant requires, within certain limits; tropical plants, heat of a certain degree, and plants of a more temperate clime their climatic heat as nearly as possible. The medium heat is from forty to eighty degrees. Now, we suppose, you are ready to commence your simple window garden with good plants. Do not buy your plants of the vinerating tribe of flower sellers, whose name is legion, and who are generally humbugs, but go to your seedsman or florist, ask him to select for you good honest plants and bulbs, and if he is an honest man he will do you no wrong. Always obtain new plants—plants that have

bloomed during the summer are not such as you should place in your window. Now as to the plants—nearly all our ladies say first the old calla lily. Well, it is a grand old plant, and its green leaves alone are full of beauty. Place this lily, if you have only one, in a good sized pot in the centre of your window. You are to recollect that for this lily the soil is to be composed of a compost made from rich loam, one quarter sand, thoroughly decayed cow manure two parts, and a small portion of leaf mould from the woods. Two or three attempts will give you the required parts of each. One fact bear in mind, for a general winter compost have on hand in barrels in your cellar rich loam, clean sand, old well rotted manure, leaf mould from the woods, meadow peat, and for some plants the old rotted stump soil found in our woods. We could tell you the exact component parts, but we think you had better rely somewhat upon yourself in the preparation of particular soils. A very good compost for general use may be made from rich loam, sand, cow manure, and leaf mould in equal parts. I have successfully used it in the above form. If you wish to add a camelia, rose, or geranium to your window, you will pot them in one part river sand, one part leaf mould, two parts of turf or garden soil. In potting your plants, press the earth well about the roots. There is what we call an unpardonable mistake, made by many of our friends, in not looking at the plant they would repot. Repotting is an art of itself, and you will find it requires knowledge to considerable extent, simple as it appears.

Watch a skilful florist the very next time you visit a green-house, and see how he repots any rose or geranium. We will tell you how he does it, or how he should do it, to have a good plant. He will take the plant he is to repot, and turn it upside down, with his left hand over the pot, the stem of the plant being between his fingers; he now gives the pot a smart rap, over the bin or barrel, and lifts up the pot, having in his hand the plant, with its ball of earth. See how very carefully he removes every worm or insect he may find. "Now," he says, "this plant requires a larger pot, for the roots are large and matted together, sometimes closely around the sides of the pot." Heed this, it is an infallible sign of "bigger pot" wanted. Give this plant a pot one size larger than the one you took it from. Now place the ball of earth or roots in the centre of the pot selected for its home, and fill it up all around with fresh soil, pressing it down firmly either with a stick or with your hands. Cover the "ball" with half an inch, and settle the dirt in the pot by gently striking the same on the edge of the table. You can now set your pot in your window. As for stimulating your plants, there are quite a number of good fertilizers, the effects of which I shall give in their proper places in these papers. But after adding a good strong plant of the English ivy (*Hedra helix*) on one side to climb up a rustic trellis, and on the other side (if you do not prefer the lantana, or running German ivy) you can place a fine plant of the *Begonia rex* as a side plant. Never think of potting a plant that has the ball of earth very dry. You must have your root moist, for you cannot well water it after repotting. A badly formed root will sometimes be found in pots, and are called "snake curls" or "snag roots;" these require skilful prunings to ever succeed. You can only in cases like this repot in a smaller pot, to which you have added powdered charcoal dust, and give gentle heat and moisture, and you may succeed.

There is no better or more showy plant to be had in this country, or one that will give you the satisfaction that this, under good culture, will. The leaves of this plant, in good circumstances, grow to considerable height, are of quite large size, and beautifully shaded with crimson, with an intermixture of broad silver zones and irregular patches. It is, as the ladies say, "a love of a plant," and we place it first among our list of plants as deserving especial attention.

In this paper we have laid down a few practical, simple rules, the results of our own careful experience, and leaving our readers to profit by the instruction of this paper we will in paper number III take them a few steps further on in this delightful study. OLLIPOD QUILL.

PRUNING OUT-DOOR GRAPE VINES.—This work, if not already done, should not be delayed. Let the pruned vines lie flat upon the ground, as it is warmer there than on the trellis. Besides allowing them there until the buds have started in the spring, it will have the effect of causing buds to strike low, and thus provide new leaders to take the place of old ones. Rampant growing vines should be cut back more severely than slow growers, and none should be trellised higher than six feet from the ground. Lateral branches should be cut to two or three buds. The soil in which grapes are grown should be kept in the best condition—ground bones being probably the best fertilizer.—*German town Telegraph.*

RESURRECTION OF LONG BURIED GERMS.—The *Canandaigua Repository and Messenger* has the following:—"About thirty years ago, near the southern boundary of this county, a farmer's wife, living in a small log cabin on a hillside, planted in front of her door a plat of flowers, among which was the purple poppy. After the farmer built himself a new house at a little distance from his former abode, to take advantage of the hill, the road was moved so as to run directly across this plat of flowers, and for twenty-five years or more there has not been seen the least vestige of any flower that formerly grew there. Last year, in working on the road, the hill was ploughed and scraped and graded down, and this year, circumstances proving favorable for the germination of the long buried seed, purple poppies are blooming along that roadway."

—What is the difference between a great coat and an infant? One you wear the other you was.

Natural History.

—The introduction of the Angora goat into Australia seems to have been quite successful. The goats were first sent to Victoria in 1856, and now are found in fair quantity in other sections of the country. The annual fleece is from three to nine pounds of mohair, which, when properly washed, is worth about 3s. 6d. a pound. There will be a rivalry some day between the Pacific and the Australian goat, and cashmere shawls may yet be within the means of the most economical of women. Happy day!

—Professor Le Conte, of Oakland, California, sends the following interesting account of the Flight of Birds, to *Nature*:

"In *Nature*, vol. viii. p. 86, Mr. J. Guthrie calls attention to, and asks explanation of, a curious phenomenon in the flight of birds observed by him:—'In the face of a strong wind,' he says, 'the hawk remained fixed in space without fluttering a wing for at least two minutes. After a time it quietly changed its position a few feet with a slight motion of its wings, and then came to rest again as before, remaining as motionless as the rocks around it.'

I have often observed the same phenomenon, but, until recently, not carefully enough to warrant any attempt at explanation, though always convinced that it was not due to any invisible vibratory motion of the wings, as suggested by Mr. Guthrie. During the past summer, however, while on a tour through the mountains of Oregon, I had a fine opportunity of watching very closely a large red-tailed hawk (*Buteo montanus*) while performing this wonderful feat, and of noting the conditions under which alone, I believe, it is possible. These conditions are precisely those described by Mr. Guthrie, viz., a steady wind, blowing across an upward slope, terminated by a ridge. For a half-hour I watched the hawk, with wings and tail widely expanded, but motionless, balancing himself in a fixed position for several minutes in the face of a strong wind; then changing his position and again balancing, but always choosing his position just above the ridge.

I explain the phenomenon as follows:—The slope of the hill determines a slight upward direction to the wind. The bird inclines the plane of his expanded wings and tail very slightly downwards, but the inclination is less than that of the wind. Under these conditions it is evident that the tendency of gravity would carry him backward and upward. The bird skilfully adjusts the plane of his wings and tail, so that these two opposing forces shall exactly balance. He changes his place and position from time to time, not entirely voluntarily, but because the varying force or direction of the wind compels him to seek a new position of equilibrium."

—Mr. Frank Buckland is the authority for this:—During my journey north last week I saw, when inspecting a salmon river, a remarkably strong, active, intelligent little boy, between four and five years old, playing about a weir. The father told me a very curious story about the child. Last Christmas he was taken to see a pantomime in which monkeys performed a great part. The scene so impressed the child's mind that the next morning he imagined himself to be a monkey. He would not speak, and no kindness or threats would make him speak a single word, he would not sit at table with his brothers and sisters at meals, but would only eat out of a plate placed on the ground, out of which he ate his food, being on all fours. If anything to eat was presented to him he always put it to his nose and smelt it, just as a monkey does before eating it. He was continually climbing up trees and throwing down boughs and grinning at the people below like the monkeys in the cocoa-nut trees in the pantomime. When his father tried to correct him the little fellow, still on all fours, ran after him and bit him on the leg. He would serve his brothers and sisters the same if they teased him. This curious monkey fit lasted until a few weeks ago, but the idea has now quite passed out of his head. I wonder if this story may possibly be of any use to Mr. Darwin. [So it seems that there are naughty little boys all over the world.]

GIZZARDS OF INSECTS.—Everyone knows that turkeys, fowls, geese, and many other birds that take their food by the peck are supplied with gizzards, and that such birds swallow grains of sand, small pebbles, and other hard substances with their food. The action of the gizzard upon this mixture may be easily understood; the hard substances are made to do the duty of teeth by crushing and grinding the softer ones to a pulp, so that teeth in the mouth of a fowl would be out of place. Many who know all this may not be aware that several insects have gizzards too, and still more wonderful, the gizzards of insects are much more complicated affairs than those of birds. If the gizzard of a cricket be laid open it will be found lined with rows of formidable teeth—a good substitute, you will say, for the sand and pebbles taken into the gizzards of birds at every meal; and, as these teeth are permanent they no doubt save the possessor of them a vast deal of trouble, unless, indeed, the cricket should ever be subject to the toothache. The gizzards of insects are not at all alike; some are lined with teeth, some with plates, some with horns, and some with bristles; but in every instance the apparatus is a very wonderful one. In a pretty little beetle not uncommon in some localities, and with a name much longer perhaps than the longest to be found in the parish register, the gizzard is about the size of a common pin's head, and is armed internally with more than four hundred teeth; imagine what the number of muscles must be to set all this machinery in motion, and keep up its action upon the food. In some species it amounts to many thousands.—*The Field*.

TRAP-DOOR SPIDERS.—These curious creatures make real doors to their dwelling-places and resent intrusion as though they were coiners or illicit distillers. The doors are fitted with solid hinges, and are generally so placed on a sloping bank that they fall to by their own weight and shut into the opening like a cork. Some of these spiders even make double doors—the first slight in texture, and covered with lichen or moss, so as to escape detection; the second constructed for serious resistance. For these double doors, one of which shall open, as it were, from without and the other only from within, there is certainly much to be said, as the experience of both men and women goes to prove. There is something almost pathetic as well as comical in the account given of the spider which, or perhaps we ought to say who, when her first door was destroyed and her second threatened, was finally captured at her post with her back set against the door, resisting with all the power of her legs this violation of territory.—*Pall Mall Gazette*.

EDITOR FOREST AND STREAM:—

The following donations to the Central Park Managerie have been received:

One Bald Eagle, *Haliaetus Caecephalus*, captured in Florida; presented by Mrs. Capt. O. Hazard.

One Flying Squirrel, *Pteromys volucella*, presented by Mr. Henry C. Carter.

One Hawk, *Falco formicivorus*, hab. Chili, presented by Ernest F. Hoffman, M. D.

One Turkey Buzzard, *Cathartes aura*, captured in Ohio; presented by Mr. Cyrus J. Van Gorder.

One Southern Fox Squirrel, *Sciurus vulpinus*; is a pure, uniform, lustrous black, with ears and nose white; presented by Mr. M. C. Lefferts. W. A. CONKLIN, Director.

The Kennel.

—CHAMPION ENGLISH POINTER, "BELLE."—The portrait of this remarkable dog, the champion of England, the winner of the great Rhiwlas Balla Field trials, elegantly engraved by the Photo-lithographic Co., with pedigree and points, will be for sale at the FOREST AND STREAM office, on and after Wednesday next, December 24th. Price, \$1.00, sent by mail.

DOG ANECDOTES.

CAPTAIN MARRYATT and Theodore Hook were wont to manufacture an inexhaustible supply of anecdotes of animals, for the especial benefit of the English provincial papers. Perhaps their neatest anecdote was about a Newfoundland dog who, when called upon to fetch three hats of different sizes, and all at the same time, pondered over the job for a while and then assorting them, slipped one hat inside of the other until he had made a nest of hats, and thus achieved his task. Very possibly it was this same dog who, when worried by a cur of low degree, took the offending puppy in a most deliberate way by the nape of the neck, carried him to the parapet of a bridge, and then let him drop into the river. All schoolboys believe in this story, as do we, the children of a larger growth. But it wanted a *dénouement*, something more, and at last a continuation has been vouchsafed to us, coming from a French source. The Newfoundland doggie stands on the bridge and sees his puny assailant floundering in the river where he has precipitated him. A tear trickles down the eye of the Newfoundland, for remorse is there; "and has not his enemy suffered enough?" says the noble dog to himself. Instantly he springs off the parapet, rescues from drowning the very same *chien* he has himself thrown into the water, and brings him to the shore. Believe it? And why not? Is it not so written?

Here, however, is a story of a dog, sent us by a kind lady correspondent from Georgia, which is very pretty. We produce the letter of our fair correspondent:—

MARIETTA, Ga., November 30, 1873.

EDITOR FOREST AND STREAM:—

My father has an old Newfoundland dog who, when her last litter of puppies were born, some four years ago, was thought to be too old to nurse them, and when the puppies were quite little—as the breed was very much esteemed in the neighborhood—her little ones were given to various friends, and I am pleased to say that all the little fellows thrive. Flora's distress at losing her little family was terrible. It was not expressed by howls or noisy exclamations of dog-like despair, but by the most intense, quiet grief, which lasted more than a year. Six months ago, my father brought to the plantation three puppies—a terrier, a mastiff, and a Newfoundland, the latter a grandchild of Flora. All three little dogs were taken by my father out of the carriage and placed on the lawn back of the house. They commenced whimpering. Instantly Flora heard them, and with every evidence of solicitude went to the Newfoundland puppy, fondled it for a moment, then took it in her mouth, pushing aside the other little dogs, carried it to her kennel. She cared for the little fellow for four months as if it had been her own child, following the colored woman who brought the milk from the dairy until her little charge had had his share of milk. If she was all tenderness to her grandchild, she was spiteful, to a degree, in regard to the other young dogs. To-day Dash, her foster son, is a fine young dog, and can take care of himself: Flora is a thoroughbred Newfoundland, rather small, feet well webbed, and was sent to my father from St. Johns, Newfoundland. As we have a large pond on the place, Flora and Dash take to the water every day in summer, and as we live in a portion of the State where the winter is quite cold at times, these dogs never suffer. I trust you will excuse a lady's writing you on a subject our sex rarely indulges in, for, save Grace Greenwood, who can write dog quite charmingly, I am afraid it is somewhat out of our sphere. Very truly, J.

Here is another dog story, just sent to us:—

Roosevelt Schuyler, Esq., of Staten Island, had a remarkably fine, unbroken, red Irish setter, which he presented some weeks ago to an officer stationed at Fort Hamilton, L. I. The dog arrived at the fort in the morning, had never been there before, but that very same night the setter was at home in Staten Island, jumping over the garden fence and barking loudly at the house door for admittance. The setter must have either taken the ferryboat or swam the channel.

Here is the story of courage in a dog, as told us by an untempered friend and thorough sportsman:—

"I was shooting quail on Land Island, some years ago,

with my dog Jack, a full-blooded black pointer. The dog got far ahead of me and pointed in an open field at a bevy of quail. Usually he was a very steady dog, and was such an excellent animal in all respects that I do not think I ever had to punish him. I loved Jack and my affection was returned. Well, the birds rose suddenly and I fired, killing four, when to my horror I found poor Jack covered with blood, a great many of the shot having raked him. He had jumped just as I had shot. I could have cried over it. I called to him. Jack came up and I talked to him as I would have done to a human being, letting him know how sorry I was, and that it was all owing to my carelessness. Jack seemed to understand me, but went on looking up the game, just as staunch and confiding as ever. I made an excellent bag that day, even after my unfortunate accident. I ought perhaps to have taken Jack straight home, but he seemed to say to me, 'It's of no consequence I assure you. It ain't of much account.' That he was hurt was certain, as he could hardly move for the next three days, though I nursed him tenderly. Jack never lost his trust in me. I have always thought that Jack, besides his hunting points, was the bravest animal I ever knew."

—From *Nature* we take the following as an instance of the collective instinct in animals:—

"A friend of mine in this neighborhood had a small terrier and a large Newfoundland. One day a shepherd called upon him to say that his dogs had been seen worrying sheep the night before. The gentleman said there must be some mistake, as the Newfoundland had not been unchained. A few days afterwards the shepherd again called with the same complaint, vehemently asserting that he was positive as to the identity of the dogs. Consequently, the owner set one watch upon the kennel, and another outside the sheep-enclosure, directing them (in consequence of what the shepherd had told him) not to interfere with the action of the dogs. After this had been done for several nights in succession, the small dog was observed to come at day-dawn to the place where the large one was chained; the latter immediately slipped his collar, and the two animals made straight for the sheep. Upon arriving at the enclosure the Newfoundland concealed himself behind a hedge, while the terrier drove the sheep towards his ambush, and the fate of one of them was quickly sealed. When their breakfast was finished the dogs returned home, and the large one, thrusting his head into his collar, lay down again as though nothing had happened. Why this animal should have chosen to hunt by stratagem prey which it could easily have run down, I cannot suggest; but there can be little doubt that so wise a dog must have had some good reason."

—The following is Canon Kingsley's charming and spirited description of the hare, fox and fox-hound:—

THE HARE.

A hare races towards us through the ferns, her great bright eyes full of terror, her ears aloft to catch some sound behind. She sees us, turns short, and vanishes into the gloom. The mare pricks up her ears too, listens, and looks; but not the way the hare has gone. There is something more coming; I can trust the finer sense of the horse, to which (and no wonder) the middle age attributed the power of seeing ghosts and fairies impalpable to man's gross eyes. Beside, that hare was not traveling in search of food. She was not loping along, looking around her right and left, but galloping steadily. She has been frightened—she has been put up; but what has put her up? And there, far away among the firstems, rings the shriek of a startled blackbird. What has put him up!

That old mare, at sight whereof your wise eyes widen till they are ready to burst, and your ears are first shot forward toward your nose, and then laid back with vicious intent. Stand still, old woman! Do you think still, after fifteen winters, that you can catch a fox?

THE FOX.

A fox it is indeed; a great dog-fox, as red as the firstems between which he glides. And yet his legs are black with fresh peat-stains. He is a hunted fox; but he has not been up long.

The mare stands like a statue; but I can feel her trembling between my knees. Positively he does not see us. He sits down in the middle of a ride, turns his great ears right and left, and then scratches one of them with his hind foot, seemingly to make it hear the better. Now he is up again and on.

Beneath yon firs, some hundred yards away, standeth, or rather lieth, for it is on dead flat ground, the famous castle of Malepartus, which beheld the base murder of Lampet the hare, and many a seely soul beside. I know it well; a patch of sand-heaps, mingled with great holes, amid the twining fir-roots; ancient home of the last of the wild beasts. And thither, unto Malepartus safe and strong, trots Reinecke, where he hopes to be snug among the labyrinthine windings and innumerable starting-holes, as the old apologue has it, of his ballium, covert-way, and donjon keep. Full blown in self-satisfaction he trots, lifting his toes delicately and carrying his brush aloft, as full of cunning and conceit as that world-famous ancestor of his, whose deeds of unchivalry were the delight, if not the model, of knight and kaiser, lady and burgher, in the Middle Age.

Suddenly he halts at the great gate of Malepartus; examines it with his nose; goes on to a postern; examines that also, and then another and another; while I perceive afar, projecting from every cave's mouth, the red and green end of a new fir-faggot. Ah, Reinecke! fallen is thy conceit, and fallen thy tail therewith. Thou hast worse foes to deal with than Bruin the bear, or Isegrim the wolf, or any foolish brute whom thy great ancestor outwitted. Man the many-counseled has been beforehand with thee; and the earths are stopped.

One moment he sits down to meditate, and scratches those trusty counselors, his ears, as if he would tear them off, "revolving swift thoughts in a crafty mind."

He has settled it now. He is up and off—and at what a pace! Out of the way, Fauns and Hamadryads, if any be left in the forest. What a pace! And with what a grace beside!

Oh Reinecke, beautiful thou art, of a surety, in spite of thy great naughtiness. Art thou some fallen spirit, doomed to be hunted for thy sins in this life, and in some future life rewarded for thy swiftness, and grace, and cunning, by

being made a very messenger of the immortals? Who knows? Not I.

THE FOX-HOUND.

The old savage ideal of beauty was the lion, type of mere massive force. That was succeeded by an over-civilized ideal, say the fawn, type of delicate grace. By cunning breeding and choosing, through long centuries, man has combined both, and has created the fox-hound, lion, and fawn in one, just as he might create noble human beings, did he take half as much trouble about politics (in the true old sense of the word) as he does about fowls. Look at that old hound, who stands doubtful, looking up at his master for advice. Look at the severity, delicacy, lightness of every curve. His head is finer than a deer's; his hind legs tense as steel springs; his fore-legs straight as arrows; and yet see the depth of chest, the sweep of loin, the breadth of paw, the mass of arm and thigh; and if you have an eye for form, look at the absolute majesty of his attitude at this moment. Majesty is the only word for it. If he were six feet high, instead of twenty-three inches, with what animal on earth could you compare him? Is it not a joy to see such a thing alive? It is to me, at least. I should like to have one in my study all day long, as I would have a statue or a picture; and when Mr. Morrell gave (as they say) two hundred guineas for Hercules alone, I believe the dog was well worth the money, only to look at. But I am a minute philosopher.

The Horse and the Course.

—The Louisiana Jockey Club Races began at New Orleans, on the 13th. The track was neither fast nor very heavy. The first race was for three-year-olds, one mile and three quarters, club purse \$500; first prize £250, second \$100, and third, \$50. Won by Nellie by a length. Time 2:27½; Carrington second; Fannie M. third, Falmouth fourth, Wanderer fifth, and Marry L. far in the rear.

—The races at San Diego, Cal., December 3, were successful in every respect. The first event was a trotting race free for all gentlemen's roadsters. There were four entries, and all started. The race was won by Chalmers Scott's Temecula Boy. Best time, 2:57½. A quarter race was won by Mayfield's Sleepy Charley. The third race was a mile dash, for two-year-olds. Three started. The race was won by Captain Johnson's Regent. Time, 2:00½.

—A race, free for all trotters and pacers, ten miles out, for a purse of \$1,000, took place on Saturday, the 13th, at the Ocean View Riding Park, San Francisco.

—The second race was for the Slocumb stakes, for two-year-olds, \$25 entrance. There were sixty-six entries, with \$700 added; second horse to receive \$300, and the third horse \$100. One mile, to carry three-years-olds weights. Nine entries came to the scratch as follows:—Paraylee, Sweet Bay, Jim Alexander, Ballankee, Larry Hart, Stampede, Bonaventure and Bay Rum. They came under the string in the following order:—Bay Rum, Paraylee, Larry Hart and Bariankee. Time, 1:57½. The third race was mile heats, for all ages. Club purse, \$500. First horse to receive \$400 and second \$100. There were eight entries:—Port Leonard, Tom Aiken, Tom Leathers, Ramesis, Quartermaster, Cape Race, Romping Girls and I O U. Tom Aiken was withdrawn, leaving seven to contest. Port Leonard won the heat easily, beating Cape Race by two lengths, with all the others on the wrong side of the distance flag. Time, 1:56. The second heat was also won by Port Leonard in 2:23½, which was little more than a walk around. It excited little interest.

—The Toronto *Sporting Times* calls attention to the fact that the entries for the Canadian Derby close on the first of next January. The stake itself will prove a rich prize, and to American breeders of thorough-bred stock it presents an unequalled medium for advertising their youngsters. Nearly every colt entered from Kentucky the last year was sold to Canadian turfmen, and at prices away up high in the centums. We ask the horsemen of old Kentucky and the many spirited ones who so worthily represent the Northern States to liberally respond to the invite, and let us have a three year old contest on the shores of Kempenfeldt Bay in July next that will be worth travelling many a hundred miles to see.

Entries can be made to this office or to the Secretary at Barrie, T. W. Simpson, Esq.

—A meet of the Quorn hounds at Melton, England, is a sight, once seen, never to be forgotten. At an ordinary meeting and a good scent day, some of the best society in Europe may be found at the Old Club.

Many Americans can testify with what kindness and elegance mounts they have been received. The numbers of ladies and gentlemen that assemble at a meet of the Quorn hounds, is almost incredible, the number, however, on one occasion was between three and six hundred, superbly mounted and dressed in the pink of hunting costumes. Hunting the fox on horseback with a splendid pack of fast speeded hounds ahead, is generally acknowledged by all cavalry officers in the world to be the best training and primary school of the cavalryman. A correspondent of the London *Field* writes an account of the first day with the Quorn. We quote:—

A brilliant opening day with the Quorn has set the ball rolling for the season. Such a morning!—fit to make a man jump out of his saddle, as many did in the very first burst, and showed the ardour of their affection by embracing old Mother Earth, covered as she was with the dew of the morning! A gay and happy crowd wended their way to Kirby Gate, where, by-the-bye, there is a gate no longer, and Her Majesty's subjects are no longer subject to that obnoxious impost which is an insult to a free country. What a flood of memory rushes over one as we try to count the good men and true who have met at the world-known trysting place, and having raced over Leicestershire's fair

pastures, have gone long ago to the happy hunting grounds! "But what is up?" exclaims one and all, as a rapidly increasing group gathers around the worthy master of the pack, and, on breaking through the crowd, we spy a dozen bareheaded old fellows, with eyes intent upon the most intelligent of their number, who, in words which smack strongly of native eloquence, is presenting a silver hunting horn to Mr. Coupland, as a token of their esteem and appreciation of his efforts to show sport. Truly "one touch of nature makes the world akin."

The hunting field is not the arena for speeches; and a few hasty words, but expressing a great deal, fall from the lips of the M. F. H., and a pleasing little episode is completed which will stand out as a red-letter day amongst all those interested in the transaction. "They're off!" cries the excited pedestrians, many a one of whom buttons up his coat for a three mile run across to Old Gurtree, a landmark in the Quorn county, almost as well known as Kirby Gate itself, and whose top, as we approach, is black over with good people, who command a fine view on every side. A few minutes to tighten up girths and get ready, and five hundred horsemen are tearing across the field to the ringing sound of the horn whose first note proclaims a welcome "Gone away" in the ear of every sportsman present. A mile is got over, and it looks like settling down for a run, but up go their heads, and thinking he may have doubled, Tom Firs takes his hounds back. Crash again true to cover! Out goes another over the same line and to the same spot. Now all is over once more. An ugly drain, almost as long as the Thames tunnel, has spoilt our sport, but a terror is handy, and a right good one he is, for, like the witches in Macbeth, "in thunder, lightning, and in hail," he bolts the brace of foxes we had brought there in fine style, and notwithstanding the elements, the pack stuck to one, and after running him round in a ring, pulled him down, not far away, just as the clouds broke, after one of the heaviest storms we have seen this year. The digging and bolting business always swallows a lot of time, and it was near upon two o'clock before we started for Adams' Gorse, which surely ought to be a perfect paradise for foxes. At any rate, three or four seem to regard it as such, for they soon moved ahead, and after we got clear away, another tried the same dodge, but was not equally successful, and he had to make the best use of his legs, in doing which he gave us a pretty gallop over such a country!—all grass and such lovely fences that it was quite a disappointment to find, after going about twenty minutes thus, we had got back to Old Gurtree. However, so it was, and there we finished our first day with the Quorn.

How MUCH WORK A HORSE CAN DO.—At a meeting of the British Association at Dublin, Mr. Charles Bianconi of Cappel read a paper relative to his extensive car establishment, after which a gentleman stated that at Pickford's the great English carriers, they could not work a horse more than ten miles a day, and wished Mr. Bianconi's opinion on the subject. Mr. B. stated that he found by experience, he could better work a horse eight miles a day for six days in the week, than six miles a day for seven days. By not working on Sunday, he effected a saving of twelve per cent. Mr. Bianconi's opinion on this point is of the highest importance, for he has over nine hundred horses working sixty-seven conveyances, which daily travel 4,244 miles. It is also the result of forty-three years' experience. —*Scientific American*.

The Magazines.

THE MEXICAN DONKEY AND HIS DRIVER.

THE only carts ever employed at Mazatlan, are rude, heavy, lumbering contrivances, each drawn by a single mule or donkey—poor, patient, enduring creatures, without whom the Mexicans could not exist, and who have certainly solved the problem of how to do the largest amount of work on the smallest amount of food. Over rough roads, almost untenable by the foot of man, these powerful and intelligent beasts carry their heavy burdens, plodding carefully and always safely over the most dangerous places, rewarded only by the croppings of the roadside, or occasionally by a handful of dried cornstalks, at the end of the days' journey. Yet I would not have it understood that the Mexican is cruel to his beast; on the contrary, he drives him by words rather than the whip, and a good understanding always seems to exist between the animal and his master. I once day witnessed an incident illustrative of this fact. A little mule, drawing a big cart laden with boxes of wine, in turning the corner of a street came into too close quarters with a post placed there to protect the sidewalk, and had brought the vehicle to a sudden stand. The driver, instead of lashing the animal and cursing him, as is too often the case in San Francisco, in the most unconcerned manner took out a cigarette, lighted it, leaned against the nearest door post, and began to smoke; in the intervals of the puffs chaffing his donkey, and laughing good humoredly at his attempts to free himself from his position. I should translate what he said as something like—"You are a pretty fellow; a nice mess you are in; don't ask me to help you; get out of it as you best can; I'm in no hurry," etc., etc.—laughing all the time as the donkey pulled and pulled about enough to break the post down. The poor little animal seemed to understand all that was said to him, and cocked his ears with a most knowing expression; then in a moment lowering them suddenly, he seemed to comprehend the difficulty. Forcing his cart backward, he gave a sudden turn, pulled himself free of the post, and marched triumphantly on with his load—his master shortly following, lighting another cigarette, and applauding the performance. I applauded, too, and walking over to the driver, extended my hand to him, saying: "Bravo! old fellow; that's better than beating him." I forgot, however, he did not understand English, so I tried Spanish; however, he understood this still less, and I concluded to try no more, so he offered me a cigarette, gave the usual salute of "Adios, Señor," and went lazily and merrily up the street after his brave little mule. —*Oceana Monthly*.

INDIAN ARROWS.—The Indians who congregated at Summit Soda Springs, summer after summer, whether from Utah or California, employed in arrow-head making every variety of flint rock, of slate, spar, and obsidian or volcanic glass. The larger heads were made of slate and obsidian, which materials served also for spear-heads, used formerly

in spearing fish, and commonly from two to four inches long. Obsidian seems to have been better adapted for all sorts of heads than any other material. It could be shaped with less risk of breaking in the process, and could be chipped with flint to a much sharper edge and point. The points of some of the small obsidian heads gathered by the writer are so keen, even after long burial or surface floating, that a slight pressure will drive them into the skin of the finger. The greatest number of small arrow-heads found, as well as the larger proportion of chips, consisted of the flints, including jasper and agate, variously and beautifully colored and marked; of obsidian, of chalcedony, of smoky quartz, and feldspar; very rarely of quartz crystal, and in only one instance of cornelian.

The workmen seem to have had more difficulty in making them, for they are often found broken and imperfect. This was due not alone to their size, but also chiefly to the difference in material when the small vein rocks were used, these breaking with a less even fracture, and being full of flaws. Persistence in the use of such uncertain material, when obsidian was so much better adapted to the purpose and equally abundant, would seem to have been dictated by a rudimentary taste for the beautiful.

A collection of the jasper, agate, chalcedony, and crystal chips and heads presents a very pretty mixture of colors, and the tints and markings of these handsome rocks could not have influenced their selection by the Indians, who spent upon their manipulation an infinite amount of care and patience. Here is the tip of a beautifully cut jasper head. We can fancy the chagrin of the Indian maker when an unlucky blow from his stone implement, or an unsuspected flaw in the flint, caused it to break off. In one instance several fragments of the same head of this material were found and fitted together. There is some reason to suppose that the selection of the above materials may occasionally have been decided by the superstitions attribution to them of occult qualities. Nearly all aboriginal tribes, and even some civilized races, have attached a peculiar sanctity and potency to certain stones, and the Chinese to this day give a religious significance to the jade. It is uncertain, however, to what extent such notions obtained among and influenced the simple savages of California. —*Oceana Monthly*.

SEEING VOLTAIRE.—Many stories are told of the unfortunate who came from far and near to see Voltaire, the intellectual wonder of his century. None better than the following, which I never met in English: One day an unknown person demanded to see the lord of Fernex. "Tell him that I am not here," shouted Voltaire. "But I hear him," urged the stranger. "Tell him I am ill, then," "I will feel his pulse; I am in that business." "Tell him I'm dead." "I'll bury him; it won't be first one either; I am a doctor." "Well," exclaimed Voltaire, "that's an obstinate mortal; let him come in. Now, sir, do you take me for a strange animal?" "Yes, sir, for the Phenix." "Do you know, then, sir, that it costs twelve sols to see me?" "Certainly; here are twenty-four; I'll come again to-morrow." Voltaire was disarmed, and lavished all manner of politeness upon his visitor. —*Ralph Keeler, Harper's Magazine*.

Answers To Correspondents.

[We shall endeavor in this department to impart and hope to receive such information as may be of service to amateur and professional sportsmen. We will cheerfully answer all reasonable questions that fall within the scope of this paper, designating localities for good hunting, fishing, and trapping, and giving advice and instructions as to outfits, implements, routes, distances, seasons, expenses, remedies, traits, species governing rules, etc. All branches of the sportsman's craft will receive attention. Anonymous Communications not Noticed.]

SPANIEL, Detroit, Mich.—Which is the most useful dog on all birds, the pointer or the setter? Ans. The setter.

J. H. S., Philadelphia—Where can I procure some boiled silk and hair salmon lines? Ans. At Andrew Clerk & Co's. 48 Maiden Lane, or Pritchard Bros., 94 Fulton street.

SPHERICAL, Poughkeepsie, N. Y.—Otis LeRoy & Co., 26 Water street, will supply you by the bag.

CAPT. JACKSON, Schooner Potosi.—You can get the leggings of C. Field & Co., 735 Broadway. Caribou hide by all means.

R. L. N.—I have a valuable setter bitch, but she sheds her hair awfully? What can I do to stop it? Ans. A weak solution of cantharides and water rubbed in well, will effectually prevent the hair from falling out.

HOLBERTON.—Why do you call the Hare a Rabbit in your paper? Ans. Because these animals are commonly known as rabbits, and few persons would know what we were talking of if we called them anything else.

F. W. CLARKE, Paterson.—A 10 bore will chamber five; put, in three layers. Eley's concentrated cartridges are best. Ask for buckshot. A smooth bore gun will shoot a ball very accurately for a short distance, say 50 yards.

MILLS, Creedmoor.—You will find the answers and all particulars in FOREST AND STREAM October 16th. Over 600 yards, target 6 feet high by 12 wide; bull's eye 4 feet square; centre, 6 feet.

BRANT, Fishkill, New York.—What is the proper charge for a No. 9 bore gun for geese shooting? Ans. 5 drachms of powder, 1 oz. and a half of No. 1 or B. shot.

WINTER CAMP.—Several times in our columns we have recommended Gail Borden's condensed coffee, meats, milk, as exceedingly desirable, and to those who have used them, almost indispensable to a camp outfit. They are among those things that have to be known to be appreciated. See advertisements in recent numbers of FOREST AND STREAM.

L. H. BOWE, M.D., New York.—We have published several letters from Maryland on quail shooting. Almost anywhere on the eastern shore of Maryland, in Anne Arundel and Calvert county. You will be able to ascertain the exact particulars from the Captain of the steamboat. Go to Baltimore, take steamer down the Chesapeake.

FLORIDA, Brooklyn.—1. Orange county, Florida, on Lake Monroe, St. Johns river, is the healthiest and most desirable part of Florida for cultivating oranges. The principal towns are Melville and Orlando. The population of the county is about 3,000. Write to W. H. McDonald, Sandford, Orange county, Fla. 2. No. sir. 3. 10 bore, 28 inch barrels, 4; \$75.

NEPION, Alton, Ill.—The large game of the Nepigon region is confined to the caribou and black bear. The fur-bearing animals number several varieties. Rabbits (hares) and ruffed grouse are very abundant. Wild fowl very scarce at all times—no feed for them. A few pigeons. Trout, pike, salmon trout, and whitefish in greatest possible abundance. Don't go to Nepigon before the middle of July.

WIDGEON, Boston, Mass.—Where can I find blue and green winged teal shooting? Ans. You will have to go at this late season to the rice plantations of South Carolina, on the bay side of the Hunting Islands, just opposite St. Helena. In September there are a good many on the shores of Delaware. Their flesh is very delicate and excellent eating, as their principal food is the seed of the reed and rice.

S. H. V., Washington, D. C.—Effects of lightning on the metals are very curious. The French Academy of Sciences have devoted considerable attention to this subject. We find in their annals the fact recorded that a woman having a purse with pieces of silver and gold, was struck, and that the metallic pieces went through some curious performances. Silver was vaporized, and coated the gold coin, and complete fusion of the two metals had taken place. Strange to say, the woman was untouched.

A WEEKLY JOURNAL,
DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY,
FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS,
AND THE INCUCLATION IN MEN AND WOMEN OF A HEALTHY INTEREST
IN OUT-DOOR RECREATION AND STUDY.

PUBLISHED BY
Forest and Stream Publishing Company,

103 FULTON STREET, NEW YORK.

Terms, Five Dollars a Year, Strictly in Advance.

A discount of twenty per cent. for five copies and upwards. Any person sending us one subscription and Five Dollars will receive a copy of Hallock's "Fishing Tourist," postage free.

Advertising Rates.
In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices, 50 cents per line. Advertisements in double column 25 per cent. extra. Where advertisements are inserted over 1 month, a discount of 10 per cent. will be made; over three months, 20 per cent; over six months, 30 per cent.

NEW YORK, THURSDAY, DEC. 18, 1873.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal letters only, to the Manager.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited. We cannot promise to return rejected manuscripts.

Ladies are especially invited to use our columns, which will be prepared with careful reference to their perusal and instruction.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.
CHARLES HALLOCK,
Managing Editor.

ENGLAND VS. AMERICA—CHALLENGE TO OWNERS OF POINTERS AND SETTERS.

WE take especial interest in publishing the following letter from Mr. Price, of Bala, North Wales, the owner of the famous pointer "Belle," with the sanction of the Rev. Cumming Macdona. As yet we have had no practical trials or field tests of pointers and setters in the United States. Yet there are many gentlemen sportsmen, who own first class American bred dogs, who would be willing to enter their animals for these tests in the field. Prize dogs are very handsome to look at and expatiate upon, but the only true criterion is public performance on the ground. We must here call the attention again of English sportsmen and boating men to this fact. Why have we invariably to cross the Atlantic to enter into trials of speed, endurance, and breed? But in this particular instance the liberality of the challenge is characteristic of the gentlemen concerned. We would suggest to Mr. Price and Mr. Macdona that they should pay us a visit. We will promise birds such as the pinnated grouse and quail *ad libitum*. As to the ground, the open prairie would be the most desirable location:—

GREAT WESTERN HOTEL, Birmingham, Eng.,)
November 29th, 1873. }

EDITOR FOREST AND STREAM:—

We are pleased to hear that our respected cousins on the other side of the Atlantic are beginning to take an interest in field trials on game for pointers and setters, the newest, and by many thought the most interesting of all our British sports, and in order to give these sportsmen in America, who have taken up shooting dogs, an opportunity of seeing the best animals perform that England can produce, Mr. Macdona and myself will be glad to make a friendly match against any pointers or setters now in America; not English dogs, imported for the purpose—these we can run at home—but *bona fide* American animals. If the owners of the American team consent to run in England, we will gladly pay expenses, and in this case a well known sportsman and master of fox hounds, Sir Watkin William Wynn, of Wynnstay, will lend the requisite ground and game. I should propose that a double match, brace against brace, should first be run off, then two single matches to follow. I would suggest as the English judge the name of Viscount Combermere, a well known arbitrator at field trials, and a renowned sportsman. Also, the 13th and 14th of August next as the date for running off the match, and, if preferred, two brace from each country can take part in it.

Your obedient servant, R. L. PRICE.

Belle, the champion pointer of England, is a liver and white bitch, pupped June 28th, 1870, by Lord Henry Ben

tick's Ranger out of his dog Grouse, and is the champion field trial dog of his day. She was first in the Rhiwlas Stakes for all aged pointers and setters, beating Mr. Macdona's Ranger, Mr. Llewellyn's Countess and Flax, Mr. Statter's Rob Roy, &c. Appended are the points she made in the Rhiwlas Stakes:—

VALLE OF POINTS WHEN PERFECT.

Name of Dog.	30 Nose.	20 Pace and style of Hunting.	20 Breaks.	15 Pointing, (style and steadiness) in	10 Backs.	5 Drawing on game or Roading.	100 Total.
Belle.	27½	20	20	15	10	5	97½

We call the attention of the following gentlemen to the above challenge:—Colonel Trigg, of Glasgow, Kentucky; Mr. George Taylor, of Virginia; Dr. Myers, of Savannah; Mr. Stephen Whitney, of Morristown, New Jersey; Mr. R. Robinson, of Brooklyn; Mr. Eyrieh, of Mississippi; Mr. Raymond, of New Jersey; Mr. Scott Rodman, of New Jersey, and Colonel Knight, of Wisconsin. The portrait of "Belle" can be seen at this office.

OPEN AIR STIMULANTS.

AN earnest and sympathetic friend, whose contributions frequently delight and instruct the readers of FOREST AND STREAM, addresses us privately in these truthful and outspoken words:—

"I look to manly and womanly sports, and to the cultivation of natural tastes, for the only corrective to the present dissipated manner in which the self-indulgent of both sexes seek, in lavish and extravagant customs and ways that enervate mind and body, the interest and occupation that fail always, and leave days of pleasure-seeking to come up in memory as disappointments only. Horatio Seymour once said to me: 'Nature never disappoints us; her mysteries when unravelled are always pleasant, and as one grows old, natural tastes grow more and more congenial, as artificial life is seen to be unsatisfying.' Your paper, as now conducted, is leading in this recoil from the whirl and press of city life, and the first to enjoy it will be the men who are most mentally driven. The shade and rest of the wild wood, the quiet impressions given by all that appeals to eye and ear, are as grateful after care and haste as a snug harbor is in a tempest; and many human wrecks would be saved did more men cool their brains in forest springs, who now cool their 'coppers' with drinks in a line at Delmonico's. I think, as life driven by steam, electricity, and stimulants, becomes more complex, the reaction to quiet life will gain power; and fortunate are those men who turn in time to the rest Mother Earth still gives—fortunate those, when they go to the quiet whence none return, who do not hold on to folly to the end."

Although these thoughts were written for private ear alone, they explain so charmingly and so concisely the philosophy of life, that we fain would print them. And when we speak of life, we do not mean *existence*—for that is something too hard to bear at times—but that quickening of those higher impulses, passions and intelligencies, inborn in men, which alone makes true enjoyment here and happiness hereafter. And what is the fulness of this enjoyment but healthful vigor of body and mind? Such condition neither needs nor craves artificial stimulants. No superheated steam is required to run the physical machine. Out-door exercise supplies all the nerve-power necessary. It kills the morbid craving of debauched stomachs, and changes the desire for alcoholic stimulants to a repugnance which revolts at taste, sight and smell thereof. It eradicates disease and throws it off with the natural foul secretions of the body. The system, surcharged with health, with all its functions in vigorous play, may well exult over and despise that casual factitious force which "rum" begets. There is something noble and grand in the fibrous, sinewy structure of the brawny backwoodsman who swings his axe, or the voyageur who poles his batteau, hour after hour from one week's end to another. Grog won't hurt them. They may take their gill at hourly intervals, but exercise, perspiration and fresh air will counteract its deleterious effects. Perhaps, and doubtless, if they continued its use, evil results would follow; but the fact is, the disposition to drink decreases with each succeeding day of labor; the intervals of desire and indulgence become less frequent until it is lost altogether. Most woodsmen will use liquor if they have it with them; but if they have it not, they cease to feel its loss after a short period of abstinence. In the winter-camps of the hardy lumbermen no strong drink is permitted; yet no one feels or complains of the deprivation. There is a glow of health and hardihood pervading all these lusty men to that degree, that when they gaze with full unflinching eye into each other's ruddy faces, they feel the mettle of their manhood and rejoice in mutual and self-respect. This is the triumph and exultation of "minds conscious of rectitude." Vileness and depravity can scarcely exist in the free atmosphere of the wild wood. The associations are all purifying and ennobling. Give us public parks, beautiful flowers and wide-extending lawns, and wickedness will skulk away from the light into its darksome reeking recesses. Give the people exercise. Instruct them all, rich and poor, and give them facilities for the practice of those pastimes which compel out-door exercise. Teach the intemperate to flee to the woods for escape from the power that enthralled. Tell them to seek new fields of recreation and change from the pestiferous atmosphere of debauching indulgence, and when they have thrown off the weight that deadens the intellect, depraves the taste, vitiates the blood, and shrinks the muscles, fully restored, they will rise up and call you blessed. This remedy is more certain and effective than inebriate asylums.

AGASSIZ.

THERE died at Cambridge, Massachusetts, on Sunday last, the 18th of December, Louis John Rudolph Agassiz, who was born at Motiers, near Neuchâtel, Switzerland, May 28th, 1807. His life and history, the various strides he made, until he stood the foremost in the world for ichthyological and almost cosmical knowledge, may be thus briefly mentioned: At eleven, Agassiz commenced his studies at the Gymnasium of Bicnne, and four years afterwards entered the College of Lausanne. In 1824 he went to Zurich, and applied himself to medical instruction for two years. Then he moved to Heidelberg, combining his anatomical physiological pursuits with that of zoology. In 1827 he was matriculated in the Munich University. Here he studied under such illustrious men as Schelling, Döllinger, Martius, Oken, and Fuchs. While a student, Spix, a distinguished zoologist, who had in charge under Professor Martius, the publication of the ichthyological portion of a work on Brazil, suddenly died, and the work was confided to Agassiz, and almost instantly the young scientist assumed a marked position. Here he abandoned all idea of making a profession of medicine, and from that time devoted himself to the study of ichthyology and kindred topics, though graduating with the highest distinction as Doctor of Medicine. He now commenced studying the fish of the Danube and the fossil forms in the fresh water deposits of Europe, continuing without intermission during a period of ten years the most laborious researches, frequenting all the European museums in quest of specimens for study and comparison. In Paris he was fortunate in becoming acquainted with Cuvier and Humboldt, the former having expressed his admiration for the accurate and artistic sketches of fish and fossils furnished by Agassiz. In 1833, Agassiz commenced the publication of his wonderful folio in five volumes on fossil fish. This work was met by the applause of the world, and the title L.L.D. by the Universities of Dublin and Edinburgh, was conferred on him. Numerous monographs followed, and from 1833 to 1840 he published many exhaustive works on the fish and shells of the present and past eras. During the summers of most of these years, amid the Alps, Agassiz studied the glacial phenomena, embodying the results of researches in two works. In 1846, Agassiz, in order to familiarize himself with the natural history and zoology of this country, visited the United States, completing a rapid survey in about a year, and lectured before the Lowell Institute, repeating his lectures in many of the principal cities. In 1847 the Scientific School in Cambridge was committed to his charge, starting with but a few pupils. His health suffering, in 1852 he accepted a position at the Medical College in Charleston, S. C., remaining there for two years, when he returned to Boston. Sometime in 1850 he commenced the preparation of his "Contributions to the Natural History of the United States," this work being published principally by the aid given by citizens of New York. The opening of Agassiz's Natural History School at Penikese, due to the munificence of Mr. Anderson, was an occurrence of but a few months ago. What brilliant discoveries, what bright promises of future wonders to the world, might not have been expected from this source? But it was not to be. Perhaps an over-tasked brain helped to carry away this great man, in the midst of his most useful years. There are but few men in this world who can take Agassiz's place. He will rank with Owen, with Wagner, with Muller, with Liebig, Cuvier, and Humboldt, as having exercised the greatest influences on the progress of modern science, and America may be proud to have induced such a man as Agassiz to have dwelt in her midst, so that her people might listen to him as to a great teacher. Unlike the conquests of the material world, which leave no traces a few years hence, what Agassiz has achieved in science must remain forever. Mr. Disraeli's words lately spoken at Glasgow are pertinent on the occasion of this brief notice of Agassiz. The ex-Premier of England said: "How much has happened in these fifty years—a period more remarkable than any, I will venture to say, in the annals of mankind? I am not thinking of the rise and fall of empires, the change of dynasties, the establishment of Governments. I am thinking of those revolutions of science which have had much more effect than any political causes, which have changed the position and prospects of mankind more than all the conquests and all the codes and all the legislators that ever lived."

THE ENGLISH SALMON HARVEST.

IT is most gratifying to learn, from no less an authority than the London Times, of the marked improvement in the yield of salmon caught in the English, Scotch, Welsh, and Irish waters. If in an economic sense alone, the increased supply of food had added immensely to the welfare of the English people, this augmentation deserves additional notice from the fact that it is to the English fishermen, the gentlemen who fish for pleasure and not for profit, that this development of the fish is due. The London Times distinctly states that it is to the individual exertions of anglers, that the laws in regard to preserving the salmon have not only been originated in England but have been enforced, and from being some few years ago a fishery of no great importance, it promises to-day to be a source of great wealth to the country at large.

The Scotch yield of salmon was wonderfully productive. The number of boxes, each box containing 112 lbs. of Scotch salmon received in London last year, was 30,181; the year before it was 24,464 boxes. The largest salmon taken north of the Cheviot Hills weighed 64 pounds.

Salmon of from 30 to 40 pounds were numerous. The salmon fisheries in England and Wales have been more than ordinarily remunerative. The Severn River claims the heaviest fish, one of 78 pounds, but this is not quite authenticated, though several of 60, and many of 50 pounds were captured. In the Usk, called the Premier angling water of England, one angler in a single day caught 26 fish weighing 280 lbs. In the Hampshire Avon, fish of 37 pounds have been taken. In the Eden and Derwent, the runs of fish have been quite large, some weighing over 40 pounds.

In Ireland the take of salmon in the estuaries and lower waters have been unusually productive, and Billingsgate Fish Market has been bountifully supplied from this source. The largest Irish salmon weighing 58 pounds was caught in the Shannon, a fish in the Suir was second, being only a pound less in weight. The Ballyshannon fisheries yielded many more tons of fish than on any preceeding year.

These fine results as we have before stated, are due to the exertions of the anglers. In proof of this, as early as 1860, the Royal Commissioners fairly and fully acknowledged angler's rights, and stated the obligations they were under to the private salmon fishermen, for advice as to how the salmon should be best protected, and their number increased.

Such results as recorded are most pleasant for us to publish. The FOREST AND STREAM endeavors to inculcate this idea, "that a practical knowledge of natural history must of necessity underlie all talents which combine to make the perfect sportsman."

Whether a man has a rod or a gun in his hand, if he is a true sportsman, he looks to the protection of the birds, beasts or fish, which afford him amusement. It is no longer paradoxical to state that the destroyer of the game is its true preserver.

CUBA, ORNITHOLOGICALLY.

WITH war and war's alarms the FOREST AND STREAM has little to do. Our province is a more peaceful one. Now that the chances are many that a settlement with Spain in regard to Cuba will be managed by protocols, memoranda and notes, more or less windy, instead of by shot shell, and bayonets, we rejoice in the fact. Nevertheless, should we have come to blows, what a gallant regiment could have been furnished from our own sun-browned and weather-stained subscribers, whose experience in arms and in the field would make a formidable reinforcement for those who strike for human rights and liberty.

Some time ago, when writing about the English conflict with the Ashantees, we remarked that now-a-days the naturalist and the soldier walked together with martial stride, and that often the man of war and the devotee of science were found in one and the same individual. Some of our own people might have perhaps gloated over the possible possession of fields studded thick with the golden sugarcane, or revel in the idea of owning the Vuelta Abajo district, with its plantations of fragrant tobacco. We took, however, a more placid, less ambitious view, and only thought of the birds, fishes and beasts, of all those rich treasures to be acquired by the sportsman and the naturalist. *Quien sabe?* Perhaps it was the more philosophical way of looking at the question. Strange it is, how men examine things from diverse and various standpoints.

During the midst of the excitement a distinguished naturalist said to us, "It is very terrible to think of war and its consequences, but honestly I shall be delighted if we get Cuba. There are at least some half dozen birds in that beautiful island I have been wanting to study for years. Now Ramon de la Sagra is good authority, and his book in its way is quite exhaustive in regard to the birds, fishes and animals of the Pearl of the Antilles, but as Cuba seems likely some day or other to be ours, it is only a question of time. I trust to spend a winter there and to indulge in my ornithological tastes, and I hope even to add another page to the book of American birds."

Cuba possesses innumerable birds of varied plumage and character. Situated in the tropics, the island contains many birds common to both North and South America. Gosse's admirable book on the Birds of Jamaica will about cover the whole ornithological ground, though there are several special birds native to Cuba not found in Gosse's work. Of reptiles Cuba has many, but no poisonous snakes. Alligators abound. Iguanas are found, and on her coast are numerous fish and all varieties of turtles.

Of animals, save those introduced by foreigners, there are hardly any. What says the old chronicler of Columbus: "The Admiral disembarked and approached two houses; in one he found a dog who never barked, (*que nunca ladro.*") Oveida says Columbus found no four-footed animal, save dogs, and they gave out no sound. The same authority tells however of the peculiar rabbits which abounded at the period of its discovery, and mentions that the natives called them Quemi-Mohuy-Cori-Ayre, and Quabonquines. These ruminants were varieties of the Agouti, which species has been almost exterminated in the West Indies. If the mammals are wanting, the birds are found in wonderful variety. Ramon de la Sagra gives over 128 varieties.

Of course do not wish to anticipate matters, but we believe the time is not far distant when some adventurous sportsman with naturalistic tendencies will give to a numerous public through the medium of FOREST AND STREAM a glowing description of what is the game in our new acquisition, Cuba, and where such are to found, with interesting data as to their habits. There is no doubt but that many a gap in the ornithological museum will some day be filled.

FLOGGING HUNTING DOGS.

THERE are many sportsmen who own hunting dogs (we don't refer to hounds) who ought by all means to break them themselves. The system of halloing, speaking coarsely, and whipping for the slightest offence is much to be regretted. Sportsmen must recollect that when teaching a thoroughbred pointer or setter, they are dealing with an animal gentleman. No sportsman should attempt to break a yearling dog unless he is possessed of a fair even temperament, and has absolute control over himself. To castigate a puppy two minutes after he has committed a gross error in the field would be absurd, as his latent natural instinct is almost instantly lost for the time being; but if he is whipped at the time the fault is committed, the puppy will at once know for what he has been chastised. On no account whip him more than once a day, and then severely, as if you continue to lash him for every mistake he commits his dumb instinct gets mixed, and the puppy remains the same as when you started his schooling, only that you have cowed him and injured his temper. What is the first principle of dog-breaking? It can be answered in a few words—simply to bring out the dormant instinct of the animal. How is it to be accomplished? By teaching him his A B C first. Accustom the puppy to the sound of your voice; throw him a glove, etc., and tell him quietly, always in a low tone, to fetch it; make him your companion, but never be familiar—the familiarity should always be on the puppy's side; treat him with decision and promptness, not harshness, as his delicate organization will not admit of it. A clever writer on this subject, Mr. St. John, says: "Every dog with an average share of good sense and temper is so eager for his master's approbation that he will exert himself to the utmost to obtain it; and if this fact were constantly kept in mind, the breaker-in of dogs need seldom have recourse to flogging. Indeed, I have no hesitancy in saying that five dogs out of six may be completely broken in without a blow, and that, generally speaking, quiet, patient reasoning with a dog is all that is requisite to secure his obedience and attention. I know that this is quite contrary to the opinion of most dog-breakers, who think that nothing can be done without a heavy whip and loud rating. But one thing at least is certain, that when you do punish a dog you should do it soundly, and only when you catch him 'red hand'—*in flagrante delicto*. He cannot then mistake why you flog him." Dogs have also a great deal of jealousy in their dispositions, and even this may be made to assist in their education, as it makes them strive to outdo each other. Every clever dog is especially unwilling that any of his companions should possess a greater share of his master's favor than himself. One of my dogs could not be induced to hunt in company with another, of whose advances in my good graces he was peculiarly jealous. There was no other quarrel between them. When Rover saw that a certain young dog was to accompany me, he invariably refused to go out; and although at other times one of the most eager dogs for sport that I ever possessed, nothing would induce him to go out with his young rival. He also showed his jealousy by flying at him and biting him on every possible occasion, where he could do so unobserved. At last, however, when the young dog had grown older and discovered that his own strength was superior to that of his tyrant, he flew upon poor Rover and amply revenged all the ill treatment which he had received at his hands. Although dogs form such strong attachments to man, they seldom appear to feel any great degree of friendship for each other. Occasionally, however, a couple of dogs will enter into a kind of compact to assist each other in hunting. For instance, I have known an old terrier who formed an alliance of this sort with a greyhound, and they used constantly to go out poaching together. The terrier would hunt the bushes, whilst the greyhound stationed himself quietly outside, ready to spring on any rabbit or hare that was started, and she always took the side of the bush opposite to that by which the terrier had entered it. On losing his companion, the terrier, who was becoming old in years and cunning, entered into a conspiracy with a younger terrier. In all their hunting excursions the old dog laid himself down at some likely looking run, and sending his younger companion to hunt the bushes, he waited patiently and silently for any rabbit that might come in his way. Their proceedings showed a degree of instinct almost amounting to reason.

—It has been calculated that in England, the loss of cattle from diseases propagated by the introducing foreign animals, has been fully £5,000,000 for each of the last thirty years. It seems to be the opinion there that the quantity of beef derived from imported cattle taking the losses in the home stocks into account, has not been actually increased. What they seem then to want in England is a stock of dead meat, as no practical means could be found to exercise a proper scrutiny in the importation of live stock. There is no reason why slaughtered meat from Texas or the Western Pacific plans should not be sent 10,000 miles. As has before stated in the FOREST AND STREAM, the method of preserving meat must not depend on ice alone. There are many mechanical ways with chemical adjuncts, by which the temperature of a ship's hold, or tanks full of meat placed in ships, could be refrigerated. It would be worth while if some of our ingenious experimentalists would give this subject their fullest attention. We believe this method of preserving meat by reducing the temperature, by making ice and keeping the meat at some point in the neighborhood of 32° Fahrenheit, is quite feasible, and really presents no more trouble, than to bring up the temperature to summer

heat. This problem is one which must sooner or later be solved. When this method is made perfectly practical, it would add immensely to the wealth of the United States.

Sporting News from Abroad.

THE curious question commented on by us in our last review in regard to the tiger hunting in India, and the remarkable complaint made that the Civil Service in her British Majesty's Eastern dominions, monopolized all the tiger killing, has been further continued, and the correspondence in the *Field* is quite singular in regard to it. One authority intimates that the killing of the tigers would by no means be desirable, and writes: "where there are large extents of jungle full of game of all kinds, hurtful to crops, I think that the tigers are certainly useful in killing these animals, and I am not sure that they do not in such a country do nearly as much good as harm." This same writer is quite indignant too that all tigers should have a bad name, and he intimates that although some individual tigers ought possibly to be exterminated, there may be other tigers who are quite nice animals, and ought to have protection. Altogether it is a strange topic, and treated in an eccentric way. We are inclined to think the charges made against the Civil Service are absurd.

—What we wrote in regard to Her Majesty's Stag Hounds seems to find an echo in *Land and Water*. We stated that the idea of cooping up a stag in a cart, and then letting him loose to dogs and men, was both absurd and cruel, and not sport. A correspondent in our excellent English contemporary mentions that at the last hunt two stags were unkenelled, that they ran twenty minutes, were blown and died, and that both animals were out of condition. He proposes, and quite rationally, that the stags ought to be exercised first, say with harriers before putting the regular hounds on them, and he suggests that the Society for Preservation of Cruelty to animals should interfere, and concludes thus pithily "these scandals and cruelties must end." Of course we would be the first to regret the extinction of this hunt, and of course the disappearance of these noble hounds, but times, manners and ways of amusements have changed. Look at it as we may, with due respect for old established customs, and the gallant gentlemen and ladies who follow her Majesty's chase, between the bull fight of benighted Spain with the torreadors, and the stag hunt with the best bred men in enlightened England, the line of distinction to our eyes is quite imperceptible.

—There died lately in Nottingham, the Mecca of cricketers, a brave cricketer, not unknown to us in this country, James Grundy by name. Many of us who pore over English cricketing annals, have seen his name associated with the distinguished ones of Lillywhite, Alfred Shaw and Hillyer. As a batter, though good, the younger school of the Grace character far surpassed him; but as a steady bowler of the old-fashioned kind, few were equal to him. In a match at Lord's in 1865, it is on record that Grundy bowled twenty-one successive overs without allowing a single run to be scored. "What he did," says one who writes a few kind lines in regard to him, "was to do his work honorably and efficiently, and he leaves an example to a rising generation of professional cricketers which they will do well to study and initiate."

—Those poor pheasants! Think how thick they must be at Marham House, Norfolk, thicker than mosquitoes on the Lake Superior Region. On Tuesday, Nov. 18, his Royal Highness the Prince of Wales, with numerous Earls, Lords, Viscounts, and Equerries, some ten guns in all, killed only 1,018 pheasants, 53 hares and 14 rabbits. That makes over 100 birds per gun, or man or Prince, we don't know which; not counting the additional hares and superfluous rabbits. The days are short in November in England; presupposing aristocratic habits, a late *dejeuner*, and ample time to get back to dinner, in order to dress and to appear *en grand tenue*. Say these noble sportsmen shot four or five hours, the pheasants must have risen *en masse*, and have been so plentiful that whether to shoot or to knock the birds down with the butt of their guns, must have been pretty much the same thing to this distinguished party. While on the pheasant question, this poor bird really has but few chances for life. The French garrison, near the good town of St. Germain, it seems have found out that an occasional bird, when added to their daily rations, was quite acceptable. If an English Prince bagged pheasants by the thousands, why should not the French private cabbage a few? Your French soldier with an intuitive instinct for subsisting on the enemy, studying the character of the pheasant, found out that he was fond of worms, and though a bird would take a well baited hook like a fish. Even a worm was not absolutely necessary, a fragment of cloth from his own *pantalon garance* would do the business. So he dressed his hook with a scarlet rag. Officers going into the men's quarters had their olfactory nerves delighted with the *fumet* of roasted pheasants. Of course such food, though succulent and wholesome, was not according to the dietetic instructions issued by the French Minister of War. French officers are, however, kind to their men, and though no court martials *a la Bazaine* ensued, gentlemen preserving pheasants in the neighborhood of St. Germain were at once put on their guard.

—CHAMPION ENGLISH POINTER, "BELLE."—The portrait of this remarkable dog, the champion of England, the winner of the great Rhiwlas Balla Field trials, elegantly engraved by the Photo-lithographic Co., with pedigree and points, will be for sale at the FOREST AND STREAM office, on and after Wednesday next, December 24th. Price, \$1.00, sent by mail.

—The grandest of the dog shows, the 14th annual exhibition of dogs, held at Birmingham, opened on December the 1st, and closed on Thursday the 4th. It was an exhibition of more than usual excellence, the animals being of the élite, numbering 944 in all. The champion classes were confined to prior winners of a first prize at the National Dog Show of Birmingham. For bloodhounds, Mr. Ray's Roswell took the first prize. In greyhounds, Mr. Schackleton's Lord Derby was first. For large pointers, Mr. Francis' famous dog Chang was awarded the prize. For setters, Mr. R. P. Llewellyn's dogs Prince and Countess, were first. For Irish setters, Dr. Stones' dog Dash, was winner. Among the retrievers (curly coated), Mr. J. W. Morris' True and XL, were the champions. For deerhounds, Mr. Fisher's dog Fieldman, was declared the best of dogs not adapted to field sports. The prizes for mastiffs, St. Bernard dogs, Newfoundland and Sheepdogs were numerous. It seems as if more attention was given and greater pride taken in fine dogs in England to-day than ever.

—An extraordinary run of salmon took place up the river Nith in Scotland, the last week of November. A slight fresh in the water appears to have set the upward-bound fish on the move, and they were seen pushing up the river literally in shoals. The sight was witnessed by a large crowd of persons on either bank of the river, and from the description given in the *Dumfries Courier* it was doubtless well worth seeing. "At one time no fewer than fifty fine fish could be seen lying at the foot of the slope between the ladder and the Dumfries side of the river, 'taking breath' before attempting the run up; on a broad ledge or platform of rock on the farther side of the ladder they were seen in scores, likewise apparently preparing for the ascent, while below on both sides the ladder and water were almost black with fish. Great numbers succeeded by leaping in clearing the caul; others tried the ladder with a similar satisfactory result; and the weaker fish failed for the time in both. We trust that the improvement to the increased stock of fish, which under ordinary circumstances must accrue from the abundant supply of spawning salmon in the river, will not be altogether counterbalanced by the depredations of poachers who we learn have been carrying on a ruinous but lucrative trade since this great run of salmon set in. It is reported, for instance, that on one day last week no fewer than forty-four "gravid" salmon were taken out of the "Gullet" Pool, where they were waiting for sufficient water to take them over the Dumfries Caul. These fish, which are bought for "kippering" purposes find a ready sale, and although they fetch but a few pence a pound are captured in such quantities as to make this illegal traffic a profitable trade, and affords, moreover, a great temptation to many who would never think of engaging in it were there no means of reaping pecuniary profits from their ill-gotten gains."

Rational Pastimes.

Secretaries of University and College Athletic Clubs will please mail their reports not later than Monday in each week.

YALE VS. OLD ETONIANS.

Our correspondent's letter arrived too late for our last issue. As there are some fresh facts connected with the International Foot Ball Match which have not appeared in print, we take especial pleasure in publishing his letter:—

Last Saturday week a foot ball match was played at Hamilton Park, New Haven, between eleven players selected from the "Yale twenty" and eleven graduates of the famous Eton College of England. Among the "Etonians" were Mr. C. W. Benson, celebrated as the stroke oar of last year's victorious Cambridge crew, and the champion scull of his college; also Mr. R. M. McKerrell, champion swimmer of England, and Mr. R. Russell, finest amateur English boxer. This eleven was selected from graduates of Eton scattered over the country, one coming from Canada, one from Philadelphia, but most from this city, (New York.) The game was called at half past two, Yale having won the toss and taken the wind. The first inning was a long and finely contested one, resulting after an hour's hard work in a victory for Yale. The second goal was won by Eton in fifteen minutes, and the third by Yale in twenty. After playing a short time longer, the fourth inning was declared a "draw," to enable the Etonians to take the 4.45 train home, the Yale eleven being declared winners of the First International Foot Ball Match.

The Eton game is very different from the American game as adopted at the convention, October 18. The chief points of difference are in the absence in the English game of any use of the hands, and the privilege of "lurking." The Yale eleven gave up lurking, but in other respects played her own game, while Eton for the first time tried the "hand kick" and batting. The playing on both sides was unusually fine, spectators asserting that Yale had never before played so well, and that the game was the most thoroughly satisfactory one ever played in New Haven. These are the corrected names of the players:

"OLD ETONIANS."		YALE.
G. C. Allen, Captain,		W. S. Halstead, Captain,
P. Allen,		E. V. Baker,
J. W. Balfour,		H. D. Bristol,
C. W. Benson,		C. Deming,
E. Chaplin,		F. L. Grinnell,
E. S. Handbury,		W. O. Hennerson,
R. M. McKerrell,		A. Hotchkiss,
H. Romilly,		H. T. McBirney,
Vicount Tabet,		P. A. Porter,
R. Russel,		T. T. Sherman,
H. M. Thompson,		J. L. Scudder.

S. C. B.

CRICKET.

The Manhattan club of New York, during the season of 1873, played about a dozen matches, and had some very lively games at their Saturday practice gatherings. Among their most noteworthy triumphs was their victory over the St. George, on July 30th, and their success with the Waltham club, which afterwards won a game from the St. George on the Hoboken grounds. Out of the eleven regular contests the Manhattan were engaged in in 1873, they were successful in six, thus winning a majority of the season's games. The club record for the past season is as follows:

Date.	Clubs.	Place.	Score.
June 4.	Manhattan vs. St. George,	at Hoboken.	62 to 113
June 26.	" vs. Jersey City,	at Prospect Park.	69 to 109
June 28.	" vs. Knickerbocker,	at Hoboken.	48 to 44
July 4.	" vs. Prospect Park,	at Prospect Park.	88 to 53
July 16.	" vs. Waltham,	at Hoboken.	117 to 58
July 23.	" vs. Staten Island,	at Hoboken.	114 to 115
July 30.	" vs. St. George,	at Hoboken.	80 to 71
August 6.	" vs. St. George,	at Hoboken.	107 to 131
September 5.	" vs. Staten Island,	at Statch Island.	111 to 98
October 11.	" vs. Prospect Park,	at Hoboken.	141 to 92
October 16.	" vs. Knickerbocker,	at Hoboken.	50 to 77

Totals..... 978 to 961

The majority of these games were decided by the first inning's score. In the July game with the Staten Island club the latter defeated the Manhattans with ten wickets to fall. On the return the Manhattans won in one inning and thirteen runs. The most enjoyable games the club had were those with the journalists of the Prospect Park club, and the base ball players of the Knickerbocker club. During the season the club met with a severe loss, by drowning, of their most highly esteemed member, Mr. George Keller, who besides being one of the finest fielders in the country, was in every respect a thorough gentleman and a model cricketer. The club suspended play for a month after his death, and deferred their Boston tour to next year in consequence.

Below will be found the analysis of the club play at the bat for 1873, given in the form of runs made each inning:

Players.	Innings.	Runs.	Average.	Not Out.	Highest Score.
Hosford.....	8	116	14.4	0	35
Kersley.....	6	86	14.2	0	22
Cammell.....	6	73	12.1	1	28
Ronaldson.....	9	86	9.5	0	26
Kieller.....	4	23	5.3	0	8
Beattie.....	5	27	5.2	1	10
Hayward.....	8	42	5.2	0	27
Frater.....	4	21	5.1	0	9
Lammegan.....	9	46	5.1	1	24
H. Tucker.....	11	55	5.0	1	14
Rutty.....	8	38	4.6	0	15
McDougall.....	6	29	4.5	3	20
Lloyd.....	4	18	4.2	0	9
Byron.....	3	12	4.0	0	5
Jackson.....	4	15	3.3	0	12
Rocke.....	4	12	3.0	0	9
Oakley.....	6	13	2.0	1	7
Tilly.....	5	9	1.4	1	5
Greig.....	2	3	1.1	0	3

In addition to the above players Messrs. Marsh, Donaldson, J. Tucker, Neeves, Chippendale, Glover, Tyler, Perryman, Lewis, Mears, and Evans played in single games, Marsh taking the lead with a score of 51 in two innings play. Of the general play of the principal cricketers of the club, the following comments suffice to indicate the cricket strength of the Manhattan club.

Hosford is a steady bat, strong in defence, and just the man to keep his end up against good bowling; besides which he is a very active and efficient fielder. Kersley is a fine batsman, a good fielder, and a very effective round-arm bowler, always good for a score and for his share of the wickets. Cammell is a very sharp fielder and a good bat. Ronaldson is a good batter, a fair round-arm bowler, and effective in the field. McDougall is a good wicket keeper, a very active fielder, and a good bat. Greig is a free hitter, a good bowler, and a fair fielder. Marsh is a strong bat and a good fielder. Byron is a good batter, a sharp fielder, and a fair bowler. Lewis is a good fielder and batsman. Jackson is a steady batsman, and an excellent fielder, and Hayward and H. Tucker are useful men both in the field and at the bat or in the bowler's position. Next season the Jersey City Club will amalgamate with the Manhattans and a strong team will be the result.

—The consolidation of the N. Y. Athletic Club and the N. Y. Rowing Club is only a rumor. No definite action has been taken by either club as yet; in fact, all that has been said is that some members thought it would be an advantage to all concerned.

R. W. H.

—There will be a large gathering of gentlemen interested in athletic pastimes at Wood's Museum on Dec. 29.

—Edward Mullen, of Boston, has challenged W. E. Harding, of this city, to walk from one to ten miles for \$1,000 and the championship of America. Harding has accepted this challenge, and the match will most likely take place on New Year's eve in this city.

—The Jersey City Curling Club have elected the following named gentlemen officers for the ensuing year: President, Robert A. McKnight; Wm. H. Bradt, Vice President; James C. Clark, Secretary, and William W. Edwards, Treasurer.

—Leon Leotard, the French gymnast, was seriously, if not fatally, hurt by a fall from a tight-rope, at Salt Lake City, on the 13th inst.

—James Smith walked one hundred miles in 22 hours and 33 minutes at Racine, Wisconsin, November 28th, which was a remarkable feat after a hearty Thanksgiving dinner.

UNIVERSITY OF VIRGINIA, Decr. 15, 1873.

EDITOR FOREST AND STREAM:—

We have just organized a foot ball club, and practice regularly every evening. As yet we have adopted no special rules, but have those of the Foot Ball Association under consideration. We shall play a game with some Englishmen who have settled round here some time this

month, with fifteen men to a side, they not being able to raise a larger number. I will send you the account in my next letter.

J. C. McK.

—At the race track of the Cape Fear Agricultural Association, at Wilmington, North Carolina last week a pedestrian named O'Hara walked five miles in 49 min. 26½ sec., a half mile and six yards of this distance being walked backwards.

—CHAMPION ENGLISH POINTER, "BELLE."—The portrait of this remarkable dog, the champion of England, the winner of the great Rhiwlas Balla Field trials, elegantly engraved by the Photo-lithographic Co., with pedigree and points, will be for sale at the FOREST AND STREAM office, on and after Wednesday next, December 24th. Price \$1.00, sent by mail.

Sea and River Fishing.

FISH IN SEASON IN DECEMBER.

SOUTHERN WATERS.		Sheepshead.
Pompano.	Trout, (Black Bass.)	Tailorfish.
Snapper.	Drum, (two species.)	Sea Bass.
Grouper.	Kingfish.	
Rockfish.	Striped Bass, Rockfish.	

—It has now been decided by the Chief Fish Commissioner, Professor Baird, to place the Sacramento salmon fry, that have been assigned for the Hudson River, into waters in the vicinity of Fort Edward. There are numerous cold feeders of the Hudson at that point very well adapted to the purposes required; besides, an association is being organized under the auspices of Messrs. C. E. and S. S. Bennett, of Fort Edward, for the express purpose of nursing and protecting these fish, and preventing their being hooked out by anglers, for they bite voraciously, and can hardly be distinguished from brook trout by the novice. We think that under the fostering care of the association this effort at propagation will prove successful. A letter from Professor Baird, dated Washington, December 10th, says:—

WASHINGTON, December 10th, 1873.

EDITOR FOREST AND STREAM:—

I have just telegraphed Seth Green to know if he will undertake to introduce the salmon into the Fort Edward waters. If not, I will send Mr. Milner, my assistant, on to attend to it. The head waters of the Hudson, and some tributaries of Lake Ontario, will be supplied from Seth Green's stock, and I shall request Dr. Slack, who has about 550,000 of the young fish at Bloomsbury, to introduce a portion of them into the waters of Long Island and the Sound. Seth Green recommends Smithstown River. Last year I introduced a considerable number of young Penobscot salmon into the ponds of the Long Island Southside Club at Islip, and shall send to the same place a number of the Sacramento fish. Mr. Green is to place 50,000 young fish near Fort Edward, and a quantity in the Conshocton River, an upper tributary of the Chemung, which empties into a northern branch of the Susquehanna. He will place some also in Oswego and Salmon rivers, and possibly in the Genesee.

SPENCER F. BAIRD.

—The following letter from Fish Commissioner Worrall, of Pennsylvania, was received one day too late for our last issue, and had to lie over until this week:—

HARRISBURG, December 7th, 1873.

MY DEAR SIR:—I received here yesterday, on the part of the Fishery Commissioners of this State, five large cans of water, of the capacity of twelve to fifteen gallons, containing the fry of California salmon, which Professor Cope dominates *S. quinnat*. They had been shipped at Bloomsbury, New Jersey, the night before, and arrived here at 12:30 A. M. At 8 A. M. we placed them on a wagon, and drove over rough roads, say eight miles, to Bryson's Mill, on the Connadaguinnet, probably about fifteen miles above its mouth, where Silver Spring freshens that stream. We distributed them in clear and favorable places for about a mile below the mill.

On entering the water they seemed a little dazed at first, but soon selected themselves into little groups of from ten to fifty, and in less than half an hour were all behaving like natural minnows of the stream. We brought them in water of forty degrees Fahrenheit. The Connadaguinnet water was from thirty-nine to forty-one degrees.

One half the invoice was thus left in the Connadaguinnet. We then drove about eight miles further, to Nautilly, Mr. Wm. Watt's place, on the Yellow Breeches, and there on a spring run we left the other half of our load, and they behaved in the same manner; indeed, seemed to like the last water the better of the two, for they disappeared more suddenly, most of them making for the main stream.

The cans or small tanks were estimated to contain from ten to fifteen thousand small fish, of which we actually lost but one, and he was more probably crushed by some movement of the cans than by suffocation.

The Connadaguinnet lot were in the tanks sixteen hours without change of water, and the Yellow Breeches lot were so confined for over nineteen hours.

I attribute this to Creveling's admirable method of aerating the water. He plunges a hollow cylinder of tin, about four inches in diameter, closed at the top, and having a grasping handle; but this cylinder is perforated very generally with holes, scarcely larger than what a common household pin would fit in. The length of the cylinder is about equal to the depth of the water in the can. This thing, plunged up and down mouth downwards works a mixture of air and water which I cannot imagine any device to surpass, and is indeed, in my opinion, an ingenious contrivance. Let it suffice, however, to say, that we lost not an individual of the thousands transported from the want of air or the change of water.

We have now made a fair commencement on the Lower Susquehanna, and will be ready at any moment to receive some more from you.

Dr. Slack tells me he will make a deposit at the head waters of Conacocheague early next week. He will not have so long to keep his fish in a single water, and I trust, therefore, he will be as successful as we have been.

I have bespoken Mr. Watt's good offices in the care he has taken of those placed in his neighborhood, and we shall notify the people of Cumberland county to respect everything they catch in the Canadaguinet that looks like a trout, and return it at once to the water. I remain, very truly yours,

JAMES W. WERRALL.

To Hon. SPENCER F. BAIRD, Washington, D. C.

—J. Newton Nelson, Esq., of St. John, New Brunswick, in enumerating the lakes in the vicinity, writes some pleasant little paragraphs. He says:—

I have often thought how lonely would be the lakes and streams if it were not for the beautiful inhabitants of their waters. I have seen an extensive salt lake in the Bahama Islands that would cover hundreds of acres, but not a living thing dwelt in it. Its surface was blood red, and to the gaze of the stranger all appeared like death—so quiet, so inanimate; not even a feathered songster near its shores. The low moanings of the wind whistled through the thatch-trees, and seemed to sing a dirge half weepingly. But I am to tell you of our own familiar waters, teeming with life, and around the shadowing forests of which thousands of little birds tell their tales of love. Thank God for the birds and their enchanting melodies!

Tracey's lake, twenty-eight miles from St. John, is a delightful sheet of water. It is here Edgardo and myself oftentimes go. Near its cozy beach is a comfortable house to put up at. This lake is about one mile long by half a mile wide. A charming island, shaded by spruce trees, adorns its bosom. A bar extends from its uppermost point about two hundred yards out towards the centre of the lake. Two of us, on the 17th of June, killed on this spot 106 magnificent trout. The trout in this pond are seldom over a pound and a half in weight, but they are lively, and will fight to the last. We might have nearly doubled the quantity by remaining another day.

Riley's lake, Saddler's, McCracken's, Chambers', Lerrio, Bal's, Beaver, Deer, Latemer, Long's, Spruce, and Lake Lomond are all fine waters to fish in, and vary from seven to twenty miles in distance from St. John. With the exception of the white trout family of this latter lake, the fish of all these waters are of the very finest class, being handsomely formed, brightly spotted, and of an exquisite reddish salmon color. They exist in pure limpid depths, where no sluggish fish would enjoy himself.

Lake Lomond is a delightful resort, being only eleven miles from St. John. It consists of a chain of three lakes, and in extent covers fully 2,480 acres. It contains the red and white trout, both of which are taken at three and four pounds weight. It is surrounded on the west side by an amphitheatre of high hills, and in some places by perpendicular cliffs. On its eastern shores a road extends for miles, and here the view is not only pleasant, but perfectly charming.

The Ben Lomond House looms up prettily at the foot of this lake, and the proprietor is a great big Yankee named Bunker. He keeps a well supplied table, and I have often smacked my lips over his English ale. His little blue painted boats grace the fishing cove near his premises. There is also excellent stream fishing near St. John, such as Mispeck stream, Nerepis, Radcliff's, Collins', and lastly, Garnett's Creek. Here, in one day in 1869, a friend and I took 168. Of course very many of them were small, but yet a goodly morsel for the pan.

Now I most particularly wish my readers not to suppose by any means that I am a good fisherman. I am not. I fish because I love the sport. The exercise and pure air invigorates me, I know, and I thank it in a great measure for the good health I am blessed with. A few months ago a friend and I were fishing Tracey's lake. We whipped the smooth and sometimes rippled surface most ardently, but not a rise could either of us get, and I consider Edgardo (as far as I may be a judge) to be a very fine and persevering fly fisherman. I at last became wearied, and resorted to bait. This I tried in vain. We were in a cove, the shores of which were fringed with long grass and white lilies, about four feet tall from the bottom. The trout were jumping in hundreds at something. Neither of us could capture any. Finally, Edgardo tripped up one by the tail. I held a *post mortem* on it, and found its stomach crammed full of winged ants, like pismires, just as I have seen a partridge's crop gorged with high bush cranberries. We might have fished for a week at this rate, and we would have labored for naught. The trout were glutting themselves on these insects, charging ferociously in among the rushes. By accident, we jigged about a dozen, and then the shades of evening drew her sombre curtain over the little inlet.

—Here follows a sketchy account of hake fishing through the ice in winter, a pastime which has its attractions as well as others:—

Our coasts are now frosted with the snows of firm winter. The mercury rests a little above zero. Let us go for a drive to the banks of the Kennebecasis River. This is the magnificent sheet of water on whose glassy surface many a hard battle has been decided with the oar. It is a little sea of itself, and flows gently into the St. John's River, not far above the wild roaring falls. Its shores westwardly consist of high rolling lands, with here and there a farm, environed by spruce trees and the shady ce-

dars. Opposite is the handsome and wealthy village of Rothesay. A frowning, perpendicular cliff stands to bare, naked view. It is called the "Minister's Face." A fearful looking precipice it is. The parties who named it could have had but little respect for their parson. Directly in, close to this cliff, great hauls of hake are often taken during the winter months. I have long since abandoned this cold, freezing sport, but will endeavor to describe its mysteries and pleasures, if such they are. Four of us, with horse and pung, drive down upon the ice near Torryburn. We are thoroughly clad with heavy overcoats, warm mocasins, and oversocks. Fur caps are pulled down over our ears, and around our necks are long woolen mufflers. Our hands are encased in mitts, with an extra pair in our pockets to relieve the wet ones while fishing. Our lively horse spins rapidly over the cracking ice, for the day is cold, and the ebbing or flowing of the blue tide beneath causes the thick crust to crack, crack, sometimes quite sharply, but there is no danger at all. We have three feet, as it were, of solid *terra firma* under our horse's heels. After a brisk trot of about two miles we halt, and "toss up" to decide which two of us are to go for wood and trees. Half of our number are soon off a few hundred yards up shore. The wind sweeps for miles the glistening surface, and piercing are the blasts scattering the snow drifts about.

My companion and I immediately set to work with our slices, which consist of handles or poles five feet long, fitting into sharp chisel-like instruments, a foot in length by three inches wide, sharp and keen. We cut eight holes through the crystal floor, and I assure you we feel no cold or chills till this is accomplished, for hard work it is, and more particularly with such thick ice. This duty performed, we plant spruce twigs in the freezing heaps of newly made chippings close to the openings. On these we band our lines, using fresh herrings for bait. Down they sink, and we stand shivering around, beating our arms and waiting for our twigs to bob.

Hurra! up come our wood choppers with a huge load of trees and stumps. A shelter is formed, and we gladly take possession of its lee. A roaring fire breaks forth, and we are comparatively all at home, or, as one might remark, "A nice thing on ice." A twig bends low with a jerk. One of us grasps the line, which is more like stiff wire—up, up, and a fine hake, or perhaps codfish, comes to daylight. At this not very wonderful feat we drink the newcomer's health. This, however, proves certain death to our guest, who becomes in five minutes after his appearance on top as stiff as a brick.

An ordinary take in this way to four men in one day is eight dozen. The hake is very sweet flavored, and when served up hot, with an abundance of good butter and pepper, might make the most fastidious smack their dainty lips. A steak is broiled, a cup of strong coffee made, and I tell you, patient reader, that a fellow like me would put down on such an occasion a goodly amount, such as would raise "Ned" with a victim of indigestion at first, but a few days at this exercise, and a few doses of this medicine, would cure him, I think, and put quack mixtures to flight. Dyspeptics, try it.

Enough fish caught, we haul up lines, pack into our pung, and away, away over the slippery road to shore. At McGowan's Claremont House we stop to warm up and feed the horse, and again jingle on over the broad marshes towards home and St. John.

—Chris. A. Robertson, of St. John, New Brunswick, a gentleman to whom American sportsmen are annually indebted for favors, has just leased the south west branch of the Miramichi River for nine years. A note from him intimates that some of us anglers "seem to think that we have merely secured the river to make money out of it by subletting it to the Americans. We got it for ourselves, and yet we do not object to letting gentlemen occupy it when we don't want it. We do not solicit patronage, but will not prevent any stray gentleman sportsman from casting a fly. Some appear to think \$2 per day per rod too high; well, every day I have fished on that river it has cost me \$20."

—We observe by the St. John, New Brunswick *Globe* that the prospects of a good season for the fishermen is not very bright just now. There is no demand from the United States, as the markets there are stocked and money is not plenty. A considerable quantity may be taken for bait, but there will be a great excess for which a market is wanted. Notwithstanding the "advantages" of the Washington Treaty, the exportation of fish has not been large. The "catch" of fish this season is good, and the market house is well supplied with codfish, haddock, and herring. Prices are moderate, the latter selling for twelve cents a dozen, and the former from fifteen cents to \$1 each.

—We called attention, editorially, to the subjoined circular some three weeks ago, but are pleased to notice it again, and do what we can to aid the praiseworthy efforts of our officials to stock our waters with fish. The offer is a liberal one, and should be seized by all persons engaged in pisciculture:—

EDITOR FOREST AND STREAM:—

SIR:—Any person in the United States or Canada wishing to experiment in hatching salmon trout or white fish spawn will be sent a few hundred spawn on receipt of fifty cents to pay for the package, by addressing the undersigned. I think that every lake, river, and pond can be made to abound with fish.

In 1872-3 I sent away 218 packages. I would like to have those to whom I sent salmon trout spawn publish their experience in the papers in their locality, so that others may be benefited by it.

SETH GREEN,

Superintendent N. Y. Fishery Commission.
Rochester, N. Y., November 21, 1873.

—Messrs. Finsch and Linderman, who visited the United States last year to investigate the condition of the fisheries and fish culture in America, have, according to the *Deutsche Fischerei Verein*, presented an exhaustive report to the German Minister of Agriculture. While in this country they examined the leading fish breeding establishments, among them the fish nurseries of Mr. Stone, Dr. Slack, Seth Green, and Mr. Brackett. They speak in the highest terms of the courtesy shown them, and descant on the great progress made in pisciculture in the United States. A considerable portion of the report, is devoted to the study of the American oyster.

OREGON SALMON FISHERIES.—It has been stated to us that at one, and perhaps the largest of the fisheries on the Columbia River, 32,000 cases, viz: 21,000 1-lb. cans and 11,000 2-lb. cans of fish have been put up the present season. About 200 barrels and 100 kits of salted salmon have been put up at the same place.

The next place down the river has done almost the same amount of business, and the fishing standing next in order of capacity to those mentioned, has put up and sold 22,000 cases, viz: 15,000 of one-pound and 7,000 of two-pound cans, and 200 barrels of 200 pounds each of salt salmon. Also, there have been put up 100 kits of fifty pounds each, of salmon bellies.

It is estimated that another fishery, about as large, has put up 20,000 cases, of forty-eight pounds per case. Some of the fisheries pack the salmon in barrels more than in cans, and occasionally one does no canning business at all. Such a one has put up 16,000 barrels, salted, 600 barrels of which go to Germany for smoking purposes. To save cooperage, tierces of 300 pounds each are sometimes used instead of barrels.

The latest estimated value of the salmon canned and salted this year is \$900,000, and this estimate is made by one engaged in the business. Five new large canneries will be put up for next year, beside the increase of the older ones.—*Portland Bulletin*.

Shot Gun and Rifle.

GAME IN SEASON FOR DECEMBER.

Moose, <i>Alces Macchis.</i>)	Caribou, <i>Tarandus Rangifer.</i>)
Elk or Wapiti, <i>Cervus Canadensis.</i>)	Red Deer, <i>Capreolus Virginianus.</i>)
Rabbits, common Brown and Grey.)	Squirrels, Red Black and Gray.)
Wild Turkey, <i>Meleagris gallopavo.</i>)	Quail, <i>Ortyx Virginianus.</i>)
Ruffed Grouse, <i>Bonasa umbellus.</i>)	Pinnated Grouse, <i>Cupidoria Cupido.</i>)
	All kinds of Wild Fowl.

[Under the head of "Game, and Fish in Season" we can only specify in general terms the several varieties, because the laws of States vary so much that were we to attempt to particularize we could do no less than publish those entire sections that relate to the kinds of game in question. This would require a great amount of our space. In designating game we are guided by the laws of nature, upon which all legislation is founded, and our readers would do well to provide themselves with the laws of their respective States for constant reference. Otherwise, our attempts to assist them will only create confusion.]

—We learn from Geo. Gelston, Esq., the secretary and treasurer of the Currituck Club, that in the unfortunate affair at Currituck which we reported last week, Mr. Carington's gunner shot himself accidentally, and the coroner's jury rendered a verdict to that effect. Mr. C. and his gunner were seated three feet apart in their "nest" among the tall grass, and Mr. C. was in the act of shooting a canvas back duck when the report of his companion's gun was heard almost simultaneously, and turning he comprehended the fatal catastrophe at once. An investigation showed that the accident was caused by one barrel of the gun going off while the other was being loaded, a circumstance of too frequent occurrence by far. The muzzle must have been within six inches of his head at the time. One barrel was emptied, and the other had simply powder and wad. The gunner was in the act of pouring in a handful of shot when the gun went off.

—The "Bald Eagle of Currituck" returned from his stamping ground about ten days ago. During a nineteen days' banging with his "thundering eight-bore," he killed 594 ducks, of which 213 were canvas-backs, 11 swans, and 18 geese.

—Gen. Messerole and H. M. Smith bagged a swan last week down on "Long Island's sea-girt shore" whose wings measured eight feet from tip to tip. This goodly specimen is being stuffed and mounted.

—Our correspondent, Mills, reports killing sixty-eight English snipe in three hours, at Winnebago Marsh, Wisconsin, October 24th, all single birds, ground clear, wind strong northwest; twelve gauge breech loading gun; two dogs, setter and spaniel. He says: "The large coveys of chickens found in Iowa will fully demonstrate the superiority of the breech loading guns for this work. I have to note three scores made from single coveys, respectively; 11, 14, and 19, at a single point from the first stand, all single birds, re-loading my own gun. In either case not more than four or six could have been secured with the muzzle loader."

—Our correspondent, "Luke Tripp," tells of the outfit of a well sportsman whom he met out on the plains near Fremont, Nebraska. The gentlemen in question, Mr. M., hailed from Chicago, and was wont to take a two month's cruise every year after prairie chickens. "In the first place," says Luke, "he had a magnificent tent, about fifteen feet in diameter, plenty of robes and blankets, two India rubber beds, and several pillows, and a pair of bellows to blow them up to comfortable proportions; also an India rubber bathing tub. He employed three men; one to look after the dogs, guns, ammunition, &c., one to cook, and the other to drive and take care of the horses; his hunting wagon was complete; underneath the hind part was a large wire box to put the game in, and underneath the fore part a large zinc reservoir for water; on the sides of the box were brackets for guns, and under the seats closets for ammunition, and an extra large one for the whiskey jug. Mr. M. had also plenty of provisions both wet and dry, and

in one particular box a miniature tobacco shop." A luxurious menu this. And the hunting done by Mr. M., the Captain, Max, and Tripp was something to astonish our powder-burners down East. Luke says, "By sunrise one morning we were bringing down the prairie chickens at the rate of about a hundred an hour; after indulging in this sport in the farmer's new cut rye fields for about two hours, we drove around over the prairie and picked up scattering ones. That afternoon the Captain and Max drove out from Fremont and the next day we had glorious sport. Just imagine four hunters in a line, following six dogs down a hundred acre rye stubble; first one dog would point and then another, keeping all hands tolerable busy until we got through. The next morning we all started to town, as Mr. M. expected some friends from town, and also wanted to express about five hundred chickens to some other friends there."

—In our last issue, in the review of the scores at Creedmoor, we made the following errors. Dr. Anderson of the 4th N. J. used a Ward Burton rifle, and Lieutenant Smoot in the fourth match made in seventeen shots, thirteen hits. In our next number will be found a continuation of the scores of the various matches at Creedmoor, taken from official sources.

—Dr. George F. Hawley and Mr. W. W. Hunt, of Hartford, Conn., while at Great South Bay on the 9th and 10th inst., killed thirty-nine (39) ducks and one goose, the latter being killed with a seven pound breech-loader at ten rods; all shot over stools.

—Here are some valuable instructions about the use of firearms, which we copy from a letter written by a prominent member of the New York State Sportsmen's Association, on the occasion of his making a lad a present of a gun. Some of the points will not apply to muzzle-loading arms, as the one in question was a breech-loading double barreled fowling piece. It would be well for all sportsmen, old as well as young, to study these directions carefully. We give the letter in full, omitting names and dates only:

MY DEAR NEPHEW: Yesterday I sent the gun so long promised, and I hope you will obtain from it all the pleasure anticipated. But to have any lasting enjoyment you must use it with exceeding care.

First—Never in excitement nor in fun point it towards any human being.

Second—Never carry it so that if accidentally discharged it would endanger the life of a dog even.

Third—Always think, when walking, which way your gun is pointed, and if a companion is in the field with you, no matter how near and how temptingly the game appears, do not shoot until you know just where he is, and that a stray shot may not possibly strike him, for one little pellet is sufficient to destroy an eye forever.

Fourth—Never get in a wagon without taking the cartridges from the gun.

Fifth—Never get over a fence without either taking the cartridges out, or placing the gun through the fence on the ground, so that if you fall or the fence breaks it cannot be discharged.

Sixth—Always carry the gun at half cock.
Seventh—Never let the hammers rest on the "plungers," or pieces which strike the cap.

Eighth—Never try to close it when the hammers are down.

Ninth—Never get in front of it yourself. If you see you are about to fall, drop the gun so the muzzle will be from you. Occasionally a cartridge will stick after it has been fired. A stout thin blade of knife will generally extract it, if not, remove the other cartridge, and then cut a straight stick and poke it out from the muzzle, but even then don't place your body in front of it, but content yourself with using the hand.

Tenth—After firing one barrel, take the cartridge from the other and examine the wad over the shot to see that it is not loosened by the concussion as it very frequently is, which would produce a heavy recoil, and if it gets up the barrel, will burst the gun and likely take a hand off besides.

Eleventh—Never take hold of the muzzle to draw it toward you, nor set it up, when, if falling its muzzle would be toward you.

Finally, follow all these suggestions and be self-possessed, and the fields will afford you sport without danger, and I hope without temptation.

—Mr. Chas. Pickering, of Toronto, has won the championship for pigeon shooting from Mr. Miller, of Markham, who held it through seven consecutive seasons.

—Shooting snipe at Rochester within the city limits is thus described by an old sportsman:

Rochester is a favored spot. The other day I had the good fortune to secure a bag of game within two miles of the court house that one need not be ashamed to admit he had traveled a dozen miles for. This was how it happened. Some boys returning home from chestnutting, in passing through a certain field, were somewhat startled by the sudden flight of a dozen or more birds from under their feet as they jumped over a fence in a wet spot. The boys related the occurrence to your humble servant and told him that the birds arose with a whistle and had "awful long bills." This was enough, and hastily gathering the necessary accoutrements, in fifteen minutes we were on the ground and advancing into a bit of marsh, were greeted with the inimitable cry of a Wilson's snipe that rose like a phantom, and went zig-zagging up wind; he was stopped within twenty-five yards and bagged. On reloading, not two paces were taken before a brace rose together. One scooting directly toward a horse that was grazing near by, balked us of a shot. The other turning to the left was topped over, and transferred from a potato hill to our game bag. The next shot was a clear miss, but it was the last that day, for with unusual good fortune we continued the sport until nine plump and lively snipe were within the meshes of our game bag. As we were shooting without a dog, two or three birds that rose out of distance could not be found and were left as "nest eggs," but as nine birds out of ten shots was not bad for four hours shooting—in a city—I homeward trod my way, doubting that there are many cities of 70,000 inhabitants, where a sportsman could fulfill the injunction, "go thou and do likewise."

WAD.

—It is estimated that from two to four hundred men are encamped along the line of the St. Paul and Pacific Branch Railroad, Minnesota, engaged in killing deer for market. One man is said to have slain fifty in a month, by lurking in runways, and shooting the animals when they came to drink. The same slaughter is going on along the lines of other western roads.

BRAINERD, Minn., Dec. 3, 1873.

EDITOR FOREST AND STREAM:—

A four years' experience in the forests and on the streams of central-northern Minnesota, would not be exchanged by me for the best opportunities for game animals and fish, on any "stamping ground" in the eastern and middle States.

My first experience with large game was in Wright County, this State, in the fall of 1869, in bringing down a buck, weighing not less than 300 lbs. on the hoof. On this occasion I used a Wesson breech-loading rifle, weighing about 5½ lbs; and with it I have killed since then forty-four deer.

I must tell you something about this first experience; it may recall to the memory of many of your readers similar experiences, which, I am assured, are very agreeable to remember.

Some days previous, and on two other occasions, I had seen this buck on a "dry marsh," near where I was living, and had obtained one good shot at his head and missed. I naturally felt sensitive over this poor luck, and was determined to try again and again, if necessary, until victory should crown my efforts. With this determination I set out one afternoon, about 5 o'clock, p. m., as I was then certain of catching Mr. B. feeding. Sure enough, on approaching the small marsh, which he frequented to dry his horns and feed, I discovered him, and he at the same instant discovered me, and left before I could bring my piece to bear. I followed along in the direction he took, some 400 yards, and looking back across my left shoulder, discovered Mr. B. quietly watching me at a distance of perhaps 75 yards.* I drew a bead on the forehead of the buck and fired, planting a ball in the center of his forehead equidistant between the eyes, unnerving him so quickly that when I came up to where he lay—and I made the best time of any known record of a 75 yards' run—not a muscle contracted indicative that animation had ever occupied that frame. But wasn't he a beauty! Splendid, grand, superb, even in death! And what a shot! My heart wasn't lively much either, I reckon. I did not say much—when for days afterwards old hunters praised me for that evident coolness which directed a ball to that head! I could not help saying my nerves "were steady" at the time; it flattered my vanity. But the fact was, there was not time enough between what otherwise might have been called throbs to separate them. It was one powerful concentration of muscular force knocking the wind out of me from within. I remember now distinctly that I did not breathe for about four minutes. I began to realize that something was wrong, and upon strict examination found that I was trembling all over. Every muscle in my body twitched and jerked as if some invisible spirits had each selected some particular muscle, and were desirous of discovering just how much tremendous forces combined might disturb my system. I fairly shook in my boots. Perspiration ran down my face in streams. Still I was not hurt, not frightened, no necessarily exciting cause to produce such a sensation. Nothing but a huge gigantic buck, lying there in his blue coat and splendid proportions, round and trim, and clean cut as the sculptor's model, with lofty antlers that proved him to be the "monarch of the forest," lying there in his holiday attire. It required some six minutes of time and much effort to realize this fact. I then commenced to survey the prize. His saddles were full, plump and rounded. Hair short and smooth. He carried five points on his antlers, and his limbs were sleek as those of the "Greek Slave" and just as pretty. He was a beauty! Many old hunters claimed they had spent day after day in trying to get this same identical animal. Had grown hungry and cold on his "runway," but he had dodged them all. Some of them felt a little envious for a time; others hinted that they should not have worried about it so much, but to have a "greeny" from the east come out and gobble their best piece of venison, was too bad. However, I talked knowingly of long shots, and good sights, and the best breech-loaders, and became reinstated in their good graces, and have had many a "long talk" over the incidents of a days' hunt since then, wherein I have been recognized as "one on 'em" and entitled to rank as an energetic sportsman, a No. 1, "deer shot" and to enjoy the privileges of an old hunter.

But the "buck fever" I did have, bad, too, on this first experience. That I have had it since then, slightly, it is unnecessary to admit here, though I may be induced to give your readers some further recitals of experiences in this northeastern country in which the fact may more fully appear.

[*This letter confirms what we have said in a previous number of this paper, that game is often lost by too much hunting. If men would only have patience to wait, the game will come round to them; for deer, and caribou especially, have just as much curiosity as the hunter, and perhaps more. How often the persistent enthusiast has been traveling a circle in pursuit of the deer which is perhaps following his tracks not far behind.—ED.]

—The Amateur Pigeon Shooting Tournament, open to all comers, which was begun at Toronto, Canada, on December 2d, was concluded on the 9th. There were 105 entries, distributed in twelve squads, each man allowed twenty-one rounds. Mr. Dalton, of Hamilton, won the

first prize, which was \$300 and a gold medal, having shot 20 birds out of 21. Haskell, of Detroit, killed nineteen birds.

—The international match which was commenced on Friday, between twelve Americans and twelve Canadians, for a purse of \$240, ten birds each, with the same rules as those governing the tournament, was brought to a close on Saturday, and after a close and exciting contest resulted in favor of the Canadians by three birds. The following was the score:

YACHTING REMINISCENCES.

THE YACHT META AND HER RACE WITH THE VISION.

A SIMPLE description of the race between these two celebrated yachts for the cup valued at \$500 might hardly be called a yachting reminiscence, but rather a description of a sporting event. I propose to review some of the main points of the event, and to give some of the experiences of her crew during those five trying days when her sea-going qualities, the bravery and pluck of her gallant crew, and the persistence of her owner to do or sink in the effort, were so well tried. The race has been run, although the owners of the Vision seem unwilling to admit the fact; but I propose to give my humble opinion why I assume that it has been not only run but won by the Meta.

The decision of the referee, Commodore Whitney, has not yet been received, (13th,) but will probably be given this week; as soon as it is known it will be handed to you. I may say this, however, that with the points submitted to him and the claim in writing made by the Meta party, I cannot see how he can fail to decide but one way, and that in favor of the Meta, and I say this with full and yachtmanlike deference to the owner of the Vision, his splendid yacht, and his gallant struggles for victory.

Let us look at some of the main points in the race. In full accordance with the terms of the agreement, the yachts were started by the judges for the struggle. The articles of agreement made no time limitation binding, and there were no restrictions as to anchoring. They simply, when once started, had to sail a certain distance and back to the starting point.

Let us follow them a little, or rather one of them, for after going a short distance the Vision turned back.

Being started by the judges at 11.52, Monday, October 6, they had fair weather to Long Branch. At 1 P. M. the judges hailed them and bid them go back—the wind being SSE., it was a beat to windward down the coast. After a few tacks, the Vision put about and went back. Commodore Beling said to the judges that the race had commenced and that he was going on over the course. The judges' boat then turned and went on and turned back and came alongside the Meta. Mr. Krebs, the judge for the Vision, said that she would go back to New York on account of bad weather, and that he would claim no race. Mr. Dillon, the Meta's judge, said go on. As an evidence of the stiffness of the Meta, an occurrence during that interview may be cited. While those on the judges' steamer were hanging on to the rails for dear life, being the only means of standing up in that heavy sea, Commodore Beling and some friends stood up, *afit the traveler*, hanging on to nothing except a good cup of coffee, (nothing stronger, 'pon honor,) and stood as easily and securely as possible, the Meta gently and gracefully rising and falling with each successive wave, riding like a duck. The judges' boat then started off in the direction of the race; and the Meta party supposing there had been an agreement, kept on.

After going about four miles, the steamer again turned and put back for New York. On passing the Meta, Mr. Dillon waved his hand for them to go on. At 3 P. M. the Meta arrived at the point for turning, and now things began to get lively; just at this point a heavy squall struck them from SE., as if they had not enough already, and they had to shorten sail; with a heavy sea running, they got in the jib; in trying to get down the sail, the topping lift caught the peak-halliard block. The only resource now was to wear ship, a dangerous experiment in such a sea and wind, but they tried it, watching the result, we can well imagine, with great anxiety. There she goes like lightning on the other side, and, whack, goes the boom, broken off like a pipe stem. Now it was neck or nothing, and they set about to save themselves. They could not go back now if forty judges said go back. Clear the wreck was the order, and

under the greatest difficulties they managed to get the boom clear, and rigged a lug sail upon her, which would hang too low, the block banging the wheel, and also unpleasantly whizzing past their heads. We can now imagine their really dangerous position. On consultation it was decided to scud for Barnegat, where they arrived at 2 P. M. and anchored. Here they repaired damages. Wind hauling NNE, they had to get away from that place or go ashore; they then determined to put for Egg Harbor. This was Tuesday. The Vision's judge on the Meta said he wished to get to New York. Com. Beling told him that "he considered him in the race," and that if he went ashore he abandoned the Vision's interest. He, however, went home.

On Wednesday, the 8th October, they left Egg Harbor for New York at 5 P. M., made Barnegat Light, bearing west and south at 9 P. M., going on they encountered increasing N. E. winds and very high sea. I imagine that staunch skipper "Joe" Ellsworth, made some such remark as: "Well, boys, this is the worst I ever see!" when he found that the combined forces compelled him to lay to till day-break; and then, when he found that, do his best, he could make no headway, and had to return to Egg Harbor.

How think you, Joe, some of your old friends, and often competitors, would have stood that trip? say the Addie, Gracie, Captain and others? Gone to Davy Jones, eh? Yes, and some of the two-masters, too.

On Thursday and Friday the wind continued so high and kicked up such a surf on the bar, they had to stay inside whiling away the time in repairing, perhaps imitating the wind in "blowing off;" perhaps "Johnnie" sang the "Maid from Kent." However, Saturday morning came, and they resolved to put out, leaving at 8 A. M., and beating up, reached Sandy Hook at 12 that night. Some good sailing on that beat up, you bet. If they had taken many eggs from the Harbor they left, the beating up would have made a respectable nogg by the time they reached Sandy Hook.

Now the points the Meta party make to the referee are these:—1st. They were started by the judges. 2d. There was no limitation of time, nor prohibition against anchoring in the articles of agreement. 3d. The Meta sailed over the course fully. (Should think she did.)

The stakeboat did not furnish a turning point, true—the Meta did not know the causes, and this cannot bar the Meta, even technically, for the reasons that one yacht having abandoned the race, the principal object of the stakeboat, viz.—to form a common turning point for both, was done away with, and further, the Vision having a judge on the Meta, he could see the distance sailed.

These are the points submitted to the referee, and they are awaiting his decision. But they are points which, in my estimation, entitle her at least to the fullest consideration.

Still, her owner, the worthy Commodore, is confident, plucky, and has the fullest veneration for his Meta, and does not want to win unless he sails for it. I think no one will question the fact that he "sailed for it," and it is due to the "little cherub aloft" that the Ellsworth family have not a cast away "Enoch Arden" from their number, barring the "Annie Lee" part of that beautiful poem.

I think it may be a fitting "Yachting Reminiscence" if I refer to the launch and christening of the Meta. A goodly company of yachting men were assembled at Pat. McGiehan's ship yard on a certain Saturday afternoon. There lay the Meta on the stocks, the pride of her builder, Mr. McGiehan; the joy of her owner, Com. G. A. Beling. Gracious, how busy! "Ike" McGiehan, a "chip," certain, was putting a touch here and there, greasing the ways, till a fly would slip. All Pamrapo was out. Then with noises and cheers she slid gracefully to the water and Commodore Beling's daughter, Miss Meta, broke the traditional bottle over the bow, and in a gracious and graceful manner gave her own name to the beautiful little ship. A tug-boat immediately took her in tow and a line was formed, a nautical procession as it were. The Meta first, in tow of the tug; then by a connecting hawser came the "Addie," Com. W. H. Langley, and then the "Nettie B," Allan C. Bush, each yacht covered with flags and signals. So westeamed up the Kills with music and cannon and songs into Newark Bay. The engine of a train at the drawbridge joining in the general excitement, screamed away at us; arriving at 5 P. M. at Commodore Beling's beautiful place, on Newark Bay, we all went ashore to find a bounteous repast under the trees, and kegs of lager opening at the word; with this and dancing and champagne in the evening, the day and evening was passed. Surely a good and auspicious start. Many were the toasts drunk to the success of the Meta, her owner and her namesake.

That she has fully come up to the expectations of her friends and well-wishers, I think will be acknowledged; may she do as well in the future as in the past, whether as sloop or schooner.

E. M.

—The following criticism from *Land and Water* is worthy of the attention of our University and college crews. It will be seen how the individual exertions of every member of a crew is judged and their faults told of in plain language:—

CAMBRIDGE.—"All change here," is an expression one frequently hears at railway junctions and termini. I think it might well be applied to Varsity trials. Since last week we have had great and important changes in the two boats. Shafto has been removed from Stroke, and sent three, and Wood (1st Trinity) has taken his place; Goulden has had his dismissal, and Campbell has taken his place; Peabody has come from three to four, and Rhodes has changed boats; so that the boats are now made up as follows:—

Rhodes'.
Bow, E. A. Saunders, 2d Trinity.
2, C. Etherington, Sidney.
3, C. D. Shafto, Jesus.
4, J. E. Peabody, 1st Trinity.
5, Bayley, Caius.
6, — Campbell, Trinity Hall.
7, Coode, 3rd Trinity.
Str., H. G. Rhodes, Jesus.
Cox., Wilson, Corpus.

Wood's.
Bow, S. T. Briscoe, St. Catherine's.
2, G. F. Armytage, Jesus.
3, W. Sparling, 1st Trinity.
4, A. S. Estcourt.
5, T. S. Turnbull, Trinity Hall.
6, Aylmer, 1st Trinity.
7, P. H. Hibbert, Lady Margaret.
Str., Wood, 1st Trinity.
Cox., C. F. Hunt, Jesus.

The rowing in the two boats as a whole, is decidedly worse than it has been for the last three years. The numerous changes that have been made have, no doubt, a good deal to do with it. With regard to individual rowing I will first take Rhodes' boat. Bow, Saunders, is rowing well, but is inclined to get late; (2) Etherington is not up to much; he gets very short and keeps bad times, makes no attempt at getting any beginning, and is inclined to pull himself up to his oar; (3) Shafto is improving, and was rowing much better to-day; he is rather inclined to row out of the boat, however, is frequently out of time, and wants to raise his hands over the stretcher. (4) Peabody is rowing fairly, but should row his hands in higher, as indeed all the stroke side ought to—his time, too, is rather casual. (5) Bailey is rowing very badly, he weighs 13st 9lb., gets less beginning than anybody in the boat; his time is not of the best, nor would his rowing be any the worse if he would learn to swing. (6) Campbell rows hard, but does not seem to know how to get any beginning on. (7) Coode, although it can't be said that he is rowing well, still I think that, considering his weight and size, he manages his place very fairly; he wants to be rather more careful about the time and to sit up more and to row his stroke well out. (Stroke) Rhodes is rowing fairly well, but he wants to get his shoulders further back, and to hold it well through with them, and also to get his hands out sharper. With regard to the other boat, their general fault, and especially on the stroke side, is bad time. Bow, Briscoe, rows rather well, his chief fault seems to be that he is inclined to get late; his swing is, as I said last week, perfect. (2) Armytage still has his old faults, viz., bucketing, not getting his hands out, and not marking the beginning, though they are in a somewhat modified form. (3) Sparling is improving; his finish is still awkward, but not quite so bad as it ought to be. (4) Estcourt has also improved slightly, but is still very rough; he buckets very much; gets his shoulders up and feathers under water a good deal, in which peculiarity he is followed by both Sparling and Turnbull. (5) Turnbull wants to row his hands straighter into him, and not to raise his outside one, and screw his outside shoulder up at the finish, which at present he does rather after the manner of some of the "mariners." (6) Aylmer wants to take more pains; one of his great faults is hurrying on stroke. (7) Hibbert is rowing pretty much as he always did; he is not a pretty oar, but he works hard and honestly, and is in all a good waterman, which is more than can be said of anybody else who is rowing in the Trials, except Rhodes and Saunders. (Stroke) Wood is a very pretty oar, and that is really all that can be said for him.

Art and Drama.

GOSSIP OF THE WEEK.

BY T. B. THORPE.

THE Union Square Theatre is reaping a rich harvest from its play of "Led Astray." The universal judgment appears to be that it is very attractive and very unexceptionable in its moral tendency. The consequence was, that on Saturday night there was announced on a large poster "nothing but standing room." Miss Ettyng, for the first time since she has been at the Union Square, has a character that entirely suits her, and consequently her triumphs are complete.

—At Wallack's we have genteel comedy in its best estate. On Monday "She Stoops to Conquer" was played to a delighted audience, and on Tuesday "Ours." The patrons of this unvaryingly popular establishment include the best and most cultivated classes of our permanent population.

—The Fifth Avenue is vibrating between one attraction and then another, evidently not yet settled in a "favorite rut." The failure of "Fortune" has thrown some unoccupied time on the manager's hands, which he fills up with specialties. A new play, adopted from the French by Mr. Daly, was announced for Wednesday. The stringency in the money market makes it difficult to establish a settled patronage for a newly erected place of amusement. The popularity of the original Fifth Avenue was owing a great deal to its location. "Just around the corner" from the most fashionable and crowded thoroughfare in the city, and yet almost as isolated as if in the suburbs, it was especially favorable for ladies and families. This happy location was most pleasantly observable on matinee afternoons, when the ladies, after the performance, gathered unmolested in groups on the sidewalks and talked pleasant gossip, and then took up their carriages or their pedal conveyances at their leisure and went home. This made the theatre sociable, which desirable quality added to charming nothings in the way of plays and novelties, and the Fifth Avenue was a success. But the reasons of this popularity, intellectually, do not now exist, and the atmosphere and associations that made the name so cherished cannot be transferred to other places. The fire which consumed the first Fifth Avenue Theatre, consumed the scenery, the good will, and the pleasant associations. Mr. Daly's new theatre has yet to make its reputation, and the adoption of a favorite name for it is a misnomer, and unfortunate for suggesting odious comparisons.

—Salvini has added new lustre to his reputation by starting his audiences with novelties. His genius is as varied as possible. No living tragedian approaches him in this or

in an other respect. If he could present himself in the vernacular of our country, there would be no precedence for his popularity. On Friday Signora Piamonti has a benefit. On this occasion she will assume the rôle made so popular by Ristori, of Elizabeth, Queen of England; Salvini as Essex. We bespeak for the fair *beneficiaria* what she deserves, an enthusiastic welcome and a crowded house.

—Mr. Fechter, who was once pronounced by a "leading theatrical critic" of this city to be far superior to Garrick, a man, indeed, who made Garrick an absurd tradition by comparisons, is performing at the Lyceum, supported by an extemporized company, the members of which are endeavoring to eke out a support these hard times. In recalling our reminiscences of the "immortal David," we do not remember that he ever fell on such evil times. One of the wonderful things in this world that we cannot understand is the theatrical popularity of Mr. Fechter.

—Mr. Gilmore's musical and promenade concerts are crowded on each night of performance with the representative families of the city. We are encouraged with the prospect that Mr. Gilmore will complete arrangements for opening a large and complete concert hall for popular music in the central part of the city.

THE LOTOS CLUB.

—On Saturday evening the members of the Lotos Club gave one of their informal but charming receptions to Professor R. A. Proctor, the celebrated English astronomer. The occasion brought out a large attendance of the members of the club, and a number of distinguished guests. The President, in some pleasant and appropriate remarks, introduced Professor Proctor, who in turn made an interesting reply. He paid a just tribute to the industry and correctness of American astronomers, incidentally alluding in complimentary terms to Miss Mitchell. The novelty of our country, as exhibited in its enterprise and indifference to established forms and precedence, seemed to strike him with force and with pleasure. These club receptions to literary and scientific gentlemen from abroad are pleasant additions to our metropolitan society, and they have been so well and sensibly managed by the Lotos Club that its members naturally stand high abroad, and naturally the fact of such membership, especially in London, commands recognition in the most distinguished quarters.

THE BROOKLYN ART EXHIBITION.—The Art exhibition now open at the elegant rooms of the Brooklyn Art Association in Montague street, comprises nearly four hundred pictures from foreign and native artists. Of the former, one most noticeable is "Ophelia," by J. Bertrand, a broad, striking example of French art. The gaze centres upon the face of the drowned girl as she floats in the water among the reeds clasping the wild flowers to her breast, far too real. A fine transparent piece of color, cattle and figures by Bridgeman. A winter scene by J. C. Thorn, and among the gems rank foremost the Winetaster by Grutzner, a most charming effect of expression, contented and benign, upon the face of the rotund personage, "Dinner is ready," by Piltz, a most artistic effect of light and shade, a masterly work. A fresh sparkling piece, a girl reaching for some flowers in the sunshine, by Adam. A cabinet of an old man mending a quill, by Siefert. A madonna and child, by Ittenbach exquisitely finished. An old lady with a devout look in her upturned wrinkled face by Miss Conant. While amongst the local artists are prominent examples by Leutze, of Washington at Monmouth; the effect of drawing and grouping, expression and massing is a fine example of that lamented artist. A most masterly head by Huntington, painted evidently in his palmiest days, grand and speaking. One of a child by Geo. A. Baker, in his inimitable style, fresh and pure, pearly grays and liquid carnations. A most beautiful marine by Bricher, "Manchester Cliffs," full of sparkling play of brilliant colors; also one of Sylva's best marines, showing much improvement, painted in his broad effective manner; also two by Arthur Parton with all his bright transparent color so rich and yet harmonizing so well in that silver sheen-like atmosphere, peculiar to him. An interior, with figures, by J. Beaufain Irving, most exquisitely worked up, rivaling Messonier in the minuteness of detail and finish, it shows what can be done in New York as well as in Paris. A couple of figures—a girl with a child in her arms, crossing a brook on the stones; treated in that bright sunny manner by New York's well known artist, J. G. Brown. A grand example by another New York artist, unrivalled in his glowing delineations, golden and dreamy, S. R. Gifford. A charming effect of color is a snow scene by T. W. Marshall, most artistically treated. The snow clumps upon the trees, the russet of the branches, the attitude of the plodding figure, all are well rendered. C. C. Markham, whose pictures are well known in Brooklyn, sends an interior "How cold!" A boy warming himself at a stove, the attitude is natural, the coloring harmonious, and the accessions well delineated; a pleasing, popular style of picture. Also a portrait of a child, delicately finished, with a blue French cap, whose silk and lace is most exquisitely rendered, and a camp scene upon the Little Tupper Lake, with the hounds, deer, and the luggage and utensils of the camp. J. S. Palmer sends three pictures, one of them a well painted winter scene in the woods; a fine effect. A cool, sylvan retreat, green and brilliant, by Bolton Jones, invites attention, while a most beautiful landscape by Kensett and Casalier, attracts the eye of the lover of these much noted artist's work. A little gem by Wyant, resembling Kensett in its cool gray tones. A finely rendered interior, by Toussaint, a foreign artist, with an old woman and child, beautifully drawn and modelled, and a picture by Hovender—The Reverie—most poetic in feeling and treatment. But space forbids further mention of the hosts of other pictures.

New Publications.

[Publications sent to this office, treating upon subjects that come within the scope of the paper, will receive special attention. The receipt of all books delivered at our Editorial Rooms will be promptly acknowledged in the next issue. Publishers will confer a favor by promptly advising us of any omission in this respect. Prices of books inserted when desired.]

THE REVIEWER TO HIS FRIENDS.—The near approach of Christmas and the New Year, reminds us that we have a duty to perform in the way of imparting information to our readers as to where to go for the purchase of fitting mementos of regard, or presents to their friends. Among the intellectual wants of the public, we place first books, good, amusing, and instructive books. Secondly, we shall endeavor in the *FOREST AND STREAM* to keep them always posted as to the best literary and amusing works of the day, who publish the books, where to go for the same, together with much information of an amusing and valuable kind to both publishers and their patrons. The *FOREST AND STREAM* is everywhere conceded to be the best circulating medium of literary information, in its special character of a first-class review paper, and will always be found, like a well attuned harp, never giving an uncertain sound; always an open vehicle for the diffusion of all that is rare and curious in the literature of the times. We wish to assure all our friends, publishers, advertisers, and patrons, that while we cordially tender to them the compliments of the season, we truly hope and desire that one, each and all be mutually benefitted during our next year's rambles beside the sparkling waters of the Forest and Stream.

Porter & Coates, Phila., will soon place before their readers a very interesting work, under the title of "Idle Hands," by S. T. Arthur, whose name is a guarantee that it will be something very good. They will also place their "box libraries," always popular and rich in well selected books for all ages, where every purchaser can examine them. Among them, as deserving a critical examination, please notice in six volumes "World Famous Fiction," "Presentation Library," "Ladies' Historical Society," comprising lives of five celebrated women, in four volumes, "Fairy Library," in three volumes of Swedish, French and English fairy tales. These are not one-quarter of the really good things these publishers set before you. We shall speak in our next of some other rare and valuable publications designed for the holidays from this wide awake publishing house.

Rob't Carter & Bros., New York, on the approach of the coming holidays, bid their patrons welcome to a full board of the rich and varied productions of their teeming press. Among the very desirable books published by them we notice "Songs of the Soul," gathered out of many lands and ages, by Samuel I. Prime, author of the "Alhambra" and the "Kremlin." For a really valuable present we can recommend this work as not surpassed by any for its pure teachings, its soul-stirring, elevating truths. Price \$5.

Hurd & Houghton, of the Riverside Press, have a goodly stock of very rare and useful, elegantly bound works for the holidays, varying from the low prices of \$1.50 to \$30 and \$40, all varied; and some of them exceedingly beautiful and valuable. The Egyptian sketch-book, price \$1.75, with its very rollicking story of the dancing girls of Egypt to the ladies of the Nile, the dusky Hottentot. Venus, the Gypsy Astrologers, the famous Black Jugglers, and last and by no means least, the chapter on Spirit Sweethearts, Fairy Lovers, and Goblin Wives, will interest anyone that can be interested in the rare and curious revelations of this wondrous tour into the land of the Pyramids. A wonderfully interesting book, we fully endorse it as just the book for Christmas.

Next we have from the same house "The Grammar of Painting and Engraving from the French of Charles Blanc, translated by Kate N. Daggett, and illustrated with many original illustrations. One of the best books of the season, and of great intrinsic value to art students. We shall notice this work, together with quite a number of others, in full, hereafter.

James R. Osgood & Co., Boston. Would you spend an hour or two without *enjoy*, go to Osgood's, see the rare and beautiful treasures of art and literature beneath which their tables literally groan, select from the many beautiful presents before you something with which to gladden the heart of wife, or daughter, or the boys. Why, a Christmas morning without a remembrance by good old Santa Claus is no Christmas at all. Then buy a gift at Osgood's. He has all the illustrated books of the season—all the poets, in blue and gold. Lastly, the book of the times for old Middlesex boys—"Drake's Elegant Mansions of Our Own Fireside Homes." Buy it, and anything else you wish at this art emporium of the old and new.

Lee & Shepard for the holidays present their compliments to their many patrons, and invite them to call "early and often," and promise to give them a cordial welcome to a great and valuable collection of books too numerous to mention. Here you may revel in the wild and wonderful realm of fairy land and ramble within the walls of the "Ancient City." You can find a thousand and one books at the graduated prices of low pockets, well selected, ready and waiting for you. Go to Lee, Shepard & Co., and thank us for this notice.

Scribner, Armstrong & Co., New York, have a full list of books of great variety and of all prices. The costly elegant "Illustrated Library of Favorite Song," is illustrated fully and with great fidelity and appropriateness of design. Edited by Dr. Howard. As this rare book can only be obtained of the publishers and their agents, all our friends desiring to possess an exceedingly well chosen work, especially for a holiday present, will take our advice and send their orders at once. These songs are of such a character as to recommend them to all readers, old as well as young.

It gives us true pleasure to state that the Messrs. Harper have in course of publication a very valuable edition (library edition) of Wilkie Collins' works. At this time, just the best time that could have been chosen for such an enterprise, as Mr. Collins is now among us, very many who have had the pleasure of listening to him, will more readily purchase his works. Standing almost at the head of our best living English novelists, we predict for his works in this last and best style, a large sale. Let any one who has never read "The Woman in White," procure the same, and it, and then the other two and read them carefully, and he will doubtless by that time be ready to purchase the entire set as they are placed before him in a uniform style of binding which much enhances this work. We thank the Messrs. Harper for this fine edition of Collins' works, called "Harper's Library Edition."

Then we turn to the Harpers, and Appleton & Co., R. Carter & Bros., for the juveniles, Carleton & Co. for the lively books, and Armstrong & Co., Holt & Williams, of New York, and a host of other New York publishing houses, names too numerous to mention, whose counters literally groan with Christmas presents for all good boys and girls, and where the prettiest books are to be had, at the lowest prices. We wish them all to realize from their friends the gift of a good book, and the hopes of a "Merry Christmas" from the *FOREST AND STREAM*.

Among the many elegant books of the year a prominent place must be given to "Heaven In Song," a collection of gems of Poetry of all ages on the better land, by Henry C. Fish, D. D., author of "History of Pulpit Eloquence," and published by Messrs. Sheldon & Co., 677 Broadway, New York.

Great as has been the progress made in elegant book printing in the United States, "Heaven In Song," with its rich ornamental red line borders and prettily tinted paper, classic text printing, and elegant binding, is the perfection of book production. The selections are chosen with the best of judgment, and the result is a volume suited to ornament the drawing room, for consolation in the sick room, and for hours of amusement or devotional musings.

LAND OF MOAB. [Harper & Bros.: By Tristram, will be found among the very acceptable books of the times. Quite a sensation, you will recollect, was the result of a so-called wonderful stone, found some few years since in the region of the Dead Sea, in Bible history called the Land of Moab. Now, we have a bright, life-like, sparkling history of what the author calls the land of Moab. This book comes to us in its neat Harper impress, and will not be thrust aside for some perhaps more profusely decorated. The scenes of true Bible history will be found a great inducement to give this book its place in the list of Christian keepsakes, as it can be given with a good conscience by any one to his or her friend. The scene of John the Baptist's imprisonment and his final martyrdom is graphically portrayed, and will be found deeply interesting. In point of scriptural accuracy this work may be called perfect; to the student of Sacred History invaluable.

THE WOOLING O' T. Leisure Hour Series. New York: Henry Holt & Co.

We take up the books belonging to this series, knowing that in them we find profit and pleasure.

Of this last we can say that it is a work that well sustains the character of a bright, entertaining, and by no means trivial novel, the characters of which are well delineated and not overdrawn. The story is one in which all the holy horrors of English aristocratic disdain of misalliance is vividly depicted. In the love of Lord Torchester we have a good picture of the good-natured, polished nobleman, who thinks he can have the fair Maggy Grey, the refined, quiet, noble-souled woman in her proper station merely for the asking. He finds, however, that virtue and true nobleness of soul can exist, even in the humbler walks of life. Though he is much astonished that a lord should be rejected by an humble secretary, Trofford is one of the class of strong persevering men of the world, sometimes prone to tipping; yet at last gives us by his manly course his true fidelity to principle, an example exceedingly rare in high life. The countess is one of those compound characters often found in English society, upon the whole good. Mrs. Berry, as Mrs. Berry, is a vulgar character, with naturally a good heart, perverted by too much worldly goods. She is a character our lady readers will be pleased with. She is unfortunate in her marriage with a low black-leg, one of the genus scamp, always found in London society. There are many DeBraganaces to be found, but few nobler men than Trofford and Torchester. This series of books are well suited for presents for the coming New Year.

LYNX HUNTING. By C. Stephens. Boston: James R. Osgood & Co.

All the boys who behold this book will be extravagantly pleased with it. When we read it, it gave us a new life, and all the wild sports of our younger days came vividly before us. Those days when the young blood ran riot in our veins and boyhood made us sanguine. Then again came before us our camp in the deep woods; the days of preparation for hunting on the Penobscot and other fields of note, and which we then knew well, and which "all the boys" know to-day.

We well remember the first snowy owl we dropped from a tall pine tree in the deep forest of Maine. How proud we were when we carried him from the taxidermist's shop to our home. "Lynx Hunting" goes far beyond our juvenile experience; but we can truly say you will get all your money's worth when you buy it. You will find in this work how hunting is made easy, and how to catch, trap, and shoot to perfection. For a Christmas or New Year's gift this is just the book to present to every young adventuresome boy. There is life and fun and genuine knowledge to be found within its varied pages.

FOX HUNTING, as recorded by Raed. Edited by C. A. Stephens. Illustrated. Boston: James R. Osgood & Co.

After speaking quite pertinently to the fact of our American public opinions as being quite against the old English fox hunting or coursing pastime, and that, too, for good and sufficient reasons, he says what is very true: "Fox hunting, as a business, is notoriously unprofitable. Thus of itself would be stigma enough in any Yankee community." Everyone knows that a hound following a man's heels and claiming him as his master, discounts his owner's character at a pretty heavy per centum. Nevertheless, according to our author, for aught we know there might have been an infusion of fox-hunting blood brought over in the Mayflower. It may be seen, now and then, in our village Nimrods, and wherever and whenever a "long-tailed brush" is seen the village men and boys are sure to be all agog for Reynard and Tally Ho! is the exhilarating cry that wakes the echoes of mountains of our New England villages. The author, in his attempt to Americanize somewhat this old English sport, has given the young men and boys a very amusing series of stories of wood and field, vales and plains, afloat at sea and ashore. They are as readable as we can desire: full of fun, frolic, and down East winter amusements. This winter's fox hunting tour, with all its rare excitement and ladies' accompaniment will be read by many lovers of rare and racy adventures of four young students, as one of the most entertaining books of the day.

TAINÉ'S TOUR THROUGH THE PYRENNES. By Hippolyte Adolphe Taine. Author of a "History of English Literature," "Travels in Italy," etc. Illustrated by Gustave Dore. Square 8vo. gilt, of full Levant morocco.

A superb presentation volume, with nearly 200 illustrations in Dore's early careful manner. The text and illustrations are not confined to the scenery of the country, but also include many of the adventures, tragic and grotesque, that beset the traveler; and, what is of more interest and importance, many of the legends of that historic and romantic country from Froissart and the other old chroniclers. The volume is as valuable for its historic information as for the beauty of its descriptions and illustrations of nature. This is one of the most accurate historical works to be found upon this interesting country.

BIANCA CAPELLO. A Tragedy in five acts. By Elizabeth C. Kinney. In one volume, 16mo. Hurd & Houghton, Cambridge Riverside Press.

This five act tragedy, although in verse, is quite as interesting as it would be in prose. Mrs. Kinney is well and favorably known for her poems, and from her correspondence with various newspapers, and letters written during a residence abroad, her residence being in Italy. This drama was composed in Florence, and here were drawn the characters of this startling drama of a life. The romantic and tragical story upon which it is founded is a well known historical fact, and covers the whole career of the beautiful yet guilty Bianca, who was called the "golden-haired socceress," who it is well known rose from a sad mesalliance with an humble clerk to the high and dignified station of the wife of the Grand Duke of Tuscany, with whom she perished by poison some years after while in the full prime and beauty of her power. The historical points of this tragedy are in strict accordance with the facts as they took place long ago; and the play is one that will be read with much interest. It is well written, and does the authoress justice.

POPULAR SCIENCE MONTHLY. For December. New York: D. Appleton & Co.

Well filled with new and varied matter, well sustaining the high reputation of the first-class instruction of the whole people, we find no more welcome visitor to our table than this interesting and erudite monthly. From a strongly written article by Herbert Spencer, we extract the following, which is so true to the present time that he who "runs may read," on "Mistakes of Reformers:"

"In the speeches and writings of those who advocate various political and social changes, there is so continuous a presentation of injustices and abuses and mischiefs and corruptions, as to leave the impression that, for securing a wholesome state of things, there needs nothing but to set aside present arrangements. The implication seems ever to be that all who occupy places of power, and form the regulative organization, are alone to blame for whatever is not as it should be, and that the classes regulated are blameless. 'See the injuries which these institutions inflict on you,' says the energetic reformer. 'Consider how selfish must be the men who maintain them to their own advantage and your detriment,' he adds; and then he leaves to be drawn the manifest inference that, were those selfish men got rid of, all would be well."

BOOK OF BIRDS. By Charles F. Holden. New York: Charles Reiche & Bro.; and 9 Bowdoin street, Boston; N. E. News Co., Court st.

We have received this little manual, talking pleasantly all about birds of the many different kinds used by the lover not only of the out of doors free music of the uncaged warbler, but also of our much loved captive of the Canary islands. To all who love these "God's joyous warblers" this work is dedicated. In it the whole subject of bird training or culture is made easy to the most common comprehension. The mocking bird and parrot are particularly spoken of, and new facts given to the lovers of birds never before published. All desirable information in relation to the way to take the best care of fancy Canaries and other birds is here given.

Mr. C. Reiche having been for many years an extensive dealer in almost every variety of birds, has made a specialty of this business, and a visit to his place of business is like an hour at a museum, for he knows all about birds and their treatment, and can tell you all you want to know in the most pleasant manner.

THE SHORTEST ROUTE TO GERMAN. By H. L. O. Rochrig. Andrews, McChain & Lyons, Ithaca, New York, and F. W. Christian, 77 University Place, New York, 1874.

In 1858 the author of this book issued a small volume called the "German Student's First Book," which was received with such favor by instructors and pupils that he has been induced to entirely recast and remodel his labors in the production of this second work. In this present volume under review are incorporated Mr. Rochrig's experiences of many years in teaching the German language, so that in presenting many new philological features, "The Shortest road to German" is an entirely original book. There are two methods of studying a language, the practical and philological, and both plans are combined in this most excellent class book. It is not intended that the book shall take the place of a formal grammar, but is designed to supplement any work of this nature, and will be found of singular advantage by those who are desirous of attaining any proficiency in German.

MIRIAM MONFORT. A Novel. By the author of "The Household of Bouverie." 12mo. 556 pages. New York: D. Appleton & Co.

Miriam was a "born Jewess," daughter of an educated English Jewess, who renounced her family, abjured her religion, and married with an English nobleman. Circumstances afterwards compelled him to remove to America. Prominent among the causes of this expatriation was the unkindness and uncivil treatment and contumely received by him from his aristocratic relatives and friends. The mother of Miriam died when her daughter, the heroine of this work, was only five years of age, and the father's second marriage taking place soon after, the child life of Miriam was far from a pleasant one. The whole gist of the story is to exhibit to what extent character is inherited rather than imparted by education, and in the plainest, most unequivocal manner illustrates the unjust popular prejudice against the Jewish race, which we are sorry to say exists even in our liberal American society. Some new ideas are elucidated, and the book is readable, even if it is sometimes a trifle heavy and monotonous.

RAMBLER'S GUIDE TO FLORIDA. American News Company, Nassau street, New York, 1873.

This is a useful little guide, written to the point and gives an excellent idea of the itinerary between the North and Florida. Beginning with an historical description of the state of Florida, it tells one how to reach Charleston, Savannah, and the best methods of arriving at one's ultimate destination in Florida. Steamboats and hotels are fully mentioned.

THOSE ANTLERS.—The editor of the "Woodland, Lawn and Garden" and Book Reviewer of the *FOREST AND STREAM* would, with great pleasure, acknowledge the receipt, with the compliments of the season, of a magnificent, finely mounted antlered head of the American Red Deer. This fine specimen was presented to us by Frank Robbins, Esq., of Arlington, Mass., who may be found at the celebrated game stall of his grandfather, Nathan Robbins, Esq., Faneuil Hall Market, Boston, so extensively known throughout the country.

—Happy now are the children whose thoughtful parents have bought for them "Avilude, or Game of Birds." They gather around the table with bright eyes and smiling faces as it's announced, "We are to have a game of Avilude." A whole winter of enjoyment combined with instruction, for seventy-five cents. Sent post paid on receipt of price, by West and Lee, Worcester, Mass.

TROUT SPAWN.—Any of our friends who wish to procure trout spawn are referred to the advertisement of "Church's Pisciculture Company," Fall River, Mass. This company have extensive facilities, their ponds now containing over 200,000 trout, from fingerlings to three-year-olds. Spawn will be carefully shipped to any point desired.

—Our old friend, the traveler and naturalist, Paul du Chaillu, is back again once more in the United States. Du Chaillu is one of those explorers who refuses to be lost in the wilderness, and turns up, like a very sensible man, periodically. This time his explorations have extended over the extreme northern portions of Europe. If the Gorilla no longer tempts a Du Chaillu in his younger age, now in his older time, he can be satisfied with the reindeer.

—A grammar school boy translates the old saw, "*De mortuis nil nisi bonum*," "After death there is nothing except bones."

—*Professor in Natural History* (to Spunkirk, '75).—"where would you place this creature?" *Spunkirk* (promptly).—"In the ash-barrel."—*Spectrum*.

—"Please don't shoot the cows," is a sign on a farmer's fence near Chicago, intended for city sportsmen who go out after prairie chickens.

—Fashionable Intelligence.—Ladies, this winter, will wear the same things they wore last year—if they can't buy others.

—*Small Coal Dealer*.—"Another penny, my dear. They've riz. Ah, coals is coals, now-a-days." *Little Girl*.—"I'm glad of that, sir. Mother said all the last lot was slates!"

—*Yachtman to invited Guest*.—"Would you like to take the helm?"

Guest.—"No thanks, I never take anything between breakfast and dinner."

—Potter Palmer's new hotel in Chicago is said to be the finest caravansary in the world. The building will cost about \$2,000,000; the site upon which it stands is valued at \$1,000,000, and the furnishing will cost nearly \$500,000.

—A girl who rode at a Vienna circus recently killed herself because her father beat her for being unable to accomplish some new and difficult feat. The circus was obliged to close, so great was the excitement among the people.

tions should be received by January 1st, 1874.

Send the names with the money, as fast as obtained,
that subscribers may get the paper at once. Back
numbers supplied when desired. Parties can have
until January 1st to complete their lists.

Sportsmen's Goods.

This Rifle, after being tested in the severest man-
ner by the late Board of U. S. Officers, appointed by
the Government to select the best arm for the service;
and after examining over one hundred different sys-
tems, including the best guns of Europe, say of it,
"that it is the best rifle they have seen, or of which
they have any knowledge. They therefore recom-
mend it for trial in the hands of the troops. A seven
pound carbine on this plan, with coarse military sights,
has made better targets at Creedmoor the past sum-
mer, than the best English and American target
rifles weighing 10 pounds and having peep and globe
sights.

We are now making these guns to supply the nu-
merous demands, and will soon have them in the
market.

The following is our scale of prices:—

SPECIAL MAGAZINE RIFLE for large game,
carrying from 3 to 8 cartridges, 70 to 85 grs. of
powder, 350 to 400 grs. of lead, 8 to 10 lbs.
weight.....\$60.00

and upwards, according to finish.
SPECIAL LONG RANGE MAGAZINE RIFLE
for Creedmoor shooting, 90 grs. of powder. 480
grs. of lead, carrying 3 to 8 charges, weight, 10
lbs. from.....\$100
and upwards.

MAGAZINE RIFLES for general use. Carry 3
to 9 cartridges. 60 grs. powder, 350 grs. lead
from.....\$40.00
and upwards.

SINGLE BREECH LOADERS for long range
Creedmoor shooting, 90 grs. powder; lead, 480
grs., from.....\$60.00
and upwards.

SINGLE BREECH LOADERS for general use, 6
to 7 lbs., 60 grs. powder, 350 grs. lead, from.....\$30.00
and upwards.

The calibre of all our rifles, unless otherwise or-
dered, will be 45-100.

All communications should be addressed to

BREECH LOADING GUNS
A SPECIALTY.

We would call the attention of the public to our
large assortment of
Breech-Loading Shot Guns,
Manufactured by the following celebrated makers:
Messrs. W. & C. SCOTT & SONS (winners at the In-
ternational Gun Trial of 1873); P. WEBLEY & SON,
W. W. GREENER, WESTLEY RICHARDS, J. HOL-
LIS & SONS, and other makers.

A full line of fine
PISTOLS AND RIFLES CONSTANTLY ON HAND.
DIXONS & HAWKSLEY'S SHOOTING TACKLE.

To insure good shooting from Breech-loading Guns,
we would recommend the use of the
STURTEVANT BRASS SHOT SHELLS,
manufactured by the Union Metallic Cartridge Co.,
Bridgeport, Conn. These shells are the cheapest and
best in the market, can be easily re-capped with ordi-
nary caps, without the use of the implements neces-
sary in priming all other styles of shells.

THE GOBLER'S CHRISTMAS CAROL.

A H! hungry reader! gormandizer!
How blest your lot, how foul is mine!
Pray realize it—realize, ah!
Mine 'tis to die that you may dine.

When from the natal shell I burst
To fledgling life and parent hen,
That precious life I little trusted
Would be so soon shelled out again.

Amid the barn-yard's rare attractions,
Strutting the feathered herd among,
I little dreamed such fowl eggs-actions
On Christmas holidays were wrung.

I never troubled the Hereafter;
The present was sufficient bliss—
Alas! it is no cause for laughter
To find our necks twirled short in this.

Yet 'twas for this betimes I fattened,
For this alone so fully fed;
That when a Christmas day next happened
My veins should not in vain be bled.

For this I proudly strutted, hobbled!
I dreamt not of this bitter cup.
Long time I gobbled, gobbled, gobbled,
But now at last I'm gobbled up.

Say, reader, am I justly treated?
Should that which is of right my meet
Be freely out to strangers moted?
Confess it now, I beg, entreat!

Regard my end with melancholy—
Drawn and quartered, basted, sauced—
And when you sing the yule and holly
Contemplate, too, the holocaust.

CHARLES HALLOCK.

Buffalo Hunt with the Pawnees.

THE sun pushing aside the rosy curtains of the east commences to renew his daily course, bringing again light and life to all animated nature. He touches the more elevated bluffs with flaming light and suffuses the whole heavens with a ruddy glow. The leaves of the low willows, frosted with a coating of tiny dew-drops, glisten in his light, and each silvery globule that hangs from the high grass reflects his image like a polished mirror. The waters of the Republican, dark and turbid as they always are, seem to become purer as they are touched by his beams, and flash and gleam as they whirl along toward the Missouri. The mellow whistle of the meadow lark is heard from the prairie, the short cry of the migrating blackbird falls from on high, a flock of ducks on whistling wing pass over us on their way to those genial climes where frost and snow do not penetrate, and where the rigors of winter are not felt.

The quite beauty of the prospect is enchanting, but I desire to introduce you to more stirring scenes. Bear with me for a moment, however, while I give you a brief description of the country through which we are to journey—of the land of the buffalo. Could we attain the heights traveled by the feathered travelers, that are continually passing, a magnificent view would meet our eyes. Far away to the north I would point out to you the faint dark line formed by the tall cottonwoods that fringe the Platte and by which its direction east and west may be traced as far as the eye can reach. As far to the south and scarcely to be discerned save by the keenest sight, another low dark line marks the course of the Solomon, and between these two we see many lesser streams, some flowing north and some south, each bearing its share of alluvium to swell the deltas of the Mississippi. Besides these the plain is intersected by innumerable ravines running in all directions. These serve to carry off the surplus water in times of rain, each emptying into some large one, and that in turn into one still larger, until finally a stream is formed which joins into the main river. On the borders of such streams feed the deer and elk, along their grassy bottoms stalks the wild turkey, resplendent in his bronzed plumage; among

the tangled thickets that grow upon their banks lurks the great white wolf; and amid the topmost branches of some lofty cottonwood the white-headed eagle rears her gigantic brood. Among the numberless bluffs that rise one after another like the waves of a tossing sea, the buffaloes can be seen by thousands; some peacefully reposing on the rich bottoms, others feeding upon the short nutritious grass that clothes the hillsides. The calves play clumsily about, and the old bulls from the tops of the bluffs grimly watch over their uncouth families.

Rarely are these scenes disturbed save when the prowling Sioux, returning from some foray upon the luckless settlers, halts for a brief period to rest his worn out animals and to eat his hasty meal, or when a squadron of cavalry with rattle of arms and clink of spur hurries along upon the trail of the dusky robber, all too late to recover his booty or avenge his crimes. A few hunters or a party of surveyors occasionally pass through this region, but except by these and by the Indian it is rarely visited.

We are standing upon the northern border of the present range of the buffalo. A few passing beyond the Republican advance as far north as the Platte, but rarely cross that river. South of the former, however, they still abound; not in such numbers indeed as in former years, but still often sufficiently numerous to blacken the plains and to become an easy prey to whoever will hunt them. But their days are numbered, and unless some action on this subject is speedily taken not only by the States and Territories, but by the National Government, these shaggy brown beasts, these cattle upon a thousand hills, will ere long be among the things of the past.

Jim. R.—and myself had left New York a week before, and meeting Lute at Plum Creek, had there obtained horses and a team and started off to overtake the Pawnees, who with their families and all their impedimenta, had set out from their reservation three weeks before for a grand buffalo hunt. Many a time during my wanderings west of the Missouri, had these hunts of the Indians been described to me with a graphic eloquence that filled me with enthusiasm as I listened to the recital, and I had determined that if ever the opportunity offered I would take part in one. The time had at last come, and we were now on our fourth day out from the rail road, having traveled over one hundred and twenty miles, and hoping before nightfall to catch up with the Indians.

Nor were we disappointed in this hope, for when we crossed the Republican and turned southward, the trail which we were following became fresher and gave evidences of having been made only the day before. Soon we passed their last night's camp, the ashes of the fires still warm and the fresh buffalo bones not yet dried by the sun. Encouraged by these signs we urged forward our horses, and a short time before dark our exertions were rewarded by the sight of the white lodges of the Pawnees which dotted the broad bottom of Beaver creek.

There were about two hundred lodges, occupied by over four thousand Indians, principally Pawnees, with a few Ponies and Omahas. Within the camp and among the lodges were picketed the horses. The reason for this as we afterward learned, was that the Pawnees had encountered that afternoon a small band of Sioux, and after chasing them for several miles had captured four of their horses. Of course they knew that the Sioux if they had the opportunity would return the compliment by stampeding their stock and making off with the best of it. This they intended to prevent by keeping the horses so near them that no unusual movement of the herd could be made without being noticed by some one in the camp.

The scene was one of bustling activity. The women and girls were busily at work bringing water, chopping wood and cooking, while the men strolled about the camp smoking and talking, or clustered together on the bluffs and gazed at us as we approached. Half a mile from the village we halted and made camp and after supper rode over to see old Peta-la-shar, the head chief of the Pawnees. He received us courteously, and Lute even warmly, calling him "my son," and patting him affectionately on the back

as he sat by his side. The old man told us that the hunt so far had not been very successful, that the buffalo were not plenty north of the Republican as they used to be when he was a young man, but tomorrow, he said, a grand surround would be made, as his young men had reported plenty of buffalo about twenty miles to the southward. Pleased with this intelligence we left him and after a stroll through the Indian camp returned to our own, and were soon enjoying the deep and dreamless sleep that follows a hard day's march.

But alas for our anticipations. When we rose next morning we were dismayed by the sight of a dark mist which hung over the valley, sometimes lifting for a few moments so as to disclose the bluffs beyond, and then settling down again heavier than before. It was evident that the scouts sent out by the Indians to look for buffalo would be unable to see through the heavy fog, and so our prospects for a hunt on this day were very poor. We started from our camp soon after the Pawnees moved out, and before long our doleful thoughts were dispelled by the interesting spectacle of four thousand Indians on the march.

At the head of the column walked eight men, each carrying a long pole wrapped round with red and blue cloth and fantastically ornamented with feathers, which fluttered in the breeze as they were borne along. These were the buffalo sticks, and were religiously guarded at all times, as the success of the hunt was supposed to depend largely upon the respect shown to them. Immediately after these came thirty or forty of the principal men of the tribe, all mounted on superb ponies, their saddles glittering with silver ornaments, and their bridles tinkling with little bells. Then followed a motly assemblage, consisting of the squaws of the tribe, each of whom as she walked along led one or two ponies heavily packed. A moderately loaded pony would carry, first the lodge, with the poles tied on each side of the pack, the ends dragging along on the ground, next a pile of blankets and robes a foot or two in height, around which are tied pots, tin cups, and other utensils, and on top of this heap are perched from two to five small children, each of which holds in its arms two or three young puppies. Loose horses without any burdens, and half-grown colts, each with a little pack on its back, run at large among the crowd, and their shrill neighings mingle with the barking of the dogs and the incessant clamor of the women. Along the outskirts of this strange concourse ran half a dozen well grown boys engaged in playing a game in which they seemed intensely interested, and on which as I afterwards learned, they were betting. Each held in his right hand a slender stick about four feet long, and one of them had also a ring of plated raw hide three or four inches in diameter. As the latter ran he threw this ring before him so that it rolled along upon its circumference and then each of the players tried to throw his stick through it. They were not very successful in their attempts, and I fancy that the amounts lost and won were not very heavy. As I cast my eye around over the prairie, I saw on every side small parties of Indians trudging along on foot, their blankets drawn closely about them and their bows and arrows on their back. Surprised at seeing so many walking when the number of riderless horses in the band was so large, I asked Lute the reason of it. He told me that they were letting their horses rest now, so that they might be fresh when they needed them to run buffalo.

We travel on for several hours and gradually the mist disappears beneath the powerful rays of the sun. Occasionally we cross a little stream, and as we approach it forty or fifty men and boys hurry ahead and disperse themselves through the timber, killing whatever game they can find. On one such occasion a lordly elk disturbed by these invaders, springs from a thicket and runs out toward the bluffs unfortunately on the wrong side of the creek and toward the column. Too late he perceives his mistake and turns to retrace his steps, but is met by a dozen yelling enemies. Again he turns, and now strives to escape in another direction, but twenty horsemen have shot out from the main body, and in less time than it takes to tell it the

noble animal is surrounded. He hesitates, stops, and then makes a bold dash at the weakest point in the circle, but ere he reaches it three or four arrows pierce him and he turns again. The circle grows smaller, and again he makes an effort to break it, but his strength is gone, he staggers and comes to his knees. Vain are all his efforts, the knife is at his throat, and with a groan he yields up his life; and in a few minutes naught remains to mark the spot where the beautiful creature fell save his horns and a few polished bones that shine white in the morning sun.

A little later, distant shouts great our ears and attract our attention to another quarter. As we gaze in the direction of the sounds we see the huge forms of thirty or forty buffalo appearing over a bluff but a few hundred yards away. Again the better mounted riders spur out from the line, this time myself among the number. The buffalo see us, stop, and then separate and flee in wild confusion. Half a dozen Indians and myself start after part of them and follow at a full run as they dash madly down a steep ravine throwing up dense clouds of dust in their furious career. As we near the small stream into which the ravine empties I am within thirty yards of the hindmost, when a young Indian mounted on a beautiful, but evidently untrained horse, passes me and in a few jumps is alongside of the game. He discharges an arrow, but before he has time to do more his horse, terrified by the enormous bull, carries him by, and the latter becomes now the pursuer. I put spurs to my horse and as soon as I get within easy distance, fire and the ball entering near the root of the tail ranges diagonally forward and comes out at the shoulder. The huge beast drops to the shot and I pull up to examine my first buffalo. I marvel at his monstrous size and vast strength, and admire his massive horns and hoofs, which shine like polished ebony, and his shaggy head with its impenetrable shield of hair, hide and bone; and as the Indians prepare to skin the game I remount and ride off, musing sadly upon the future of the Indian and the buffalo.

As I proceed I am joined by several returning hunters laden with spoil. The red meat neatly sliced from the bones, is piled high behind the riders, and the crimson drops which trickle from it color the flanks of the horses, already wet from their sharp exercise. My companions chatter and laugh in high glee at their success, and we converse as well as we can by means of signs and broken sentences of Pawnee and English. We reach the main body, and the bloody loads are handed over to the squaws and by them transferred to the backs of the much enduring pack animals, the march is resumed and we do not halt again until near noon, when we cross a small creek and prepare to camp. Almost all the company have crossed when we hear a shrill chorus of yells and a great fluttering of wings, and perceive that the foremost of the "skirmishers" have come upon a band of wild turkeys. Several are killed with clubs, and the rest seek safety, some by running and others by flight. One of the latter passing over us at a height of not more than twenty yards, becomes a target for all the loose articles in the camp. The air is positively darkened by the cloud of arrows, whips, sticks and hatchets that are projected at this unlucky bird. No one seems to care what his missile hits when it comes down, or whether he loses it or not, if he can only get that turkey. The latter sustains no more serious injury than the loss of a few feathers and manages to prolong his flight until he reaches the outskirts of the crowd. There he alights, however, and is immediately pounced upon and torn to pieces by the excited boys.

All hands having crossed, a spot is chosen where the creek bottom is wide enough to accommodate the whole company, and camp is made. The animals are unpacked and picketed out to feed; the lodges are set up; a hundred thin columns of smoke denote the existence of as many fires. Some of the squaws hurry away up and down the creek and soon return laden with wood and water, others plant poles upright in the ground and throwing the fresh hides over them commence the tedious operation of scraping off the flesh and fat that still adheres to them. Part of the men ride out toward the bluffs, so as to be the first to receive the news, if any thing is reported by the scouts, and a few lounge about our wagon, but by far the greatest number are in their lodges eating their midday meal.

We had been in camp two hours or more and were lazily reclining under the wagon, when a sudden bustle among the Indians attracted our attention, and on looking out toward the bluffs we saw a horseman riding hard for camp, while the men that he passed shouted and gesticulated in great excitement. On reaching the lodges the rider halted near a group of the chief men and spoke a few words to them. He then rode off again, and after a short consultation some order was given, and in ten minutes the lodges were down and packed and a part of the company were flying off down the creek. Only the women and children, however. While the packing was being done the men had moved the saddles and bridles from their horses, substituting for the latter a strip of raw hide around the lower jaw. They had also stripped off their own clothing and stood forth as naked as when they came into the world, save for a breech clout and a pair of moccasins apiece. Their bows and arrows they held in their hands. At a given signal they started off, at first on a slow trot, but gradually increasing their speed until the trot became a canter and the canter a swift gallop.

At the first movement in the camp Lute had notified us of what would take place, and we had saddled up and leaving all our superfluous articles in the wagon had made ready to start. The wild gallop over the prairie with that excited multitude was an experience calculated to impress

itself indelibly upon the memory, and I shall never forget it.

The band was at first widely scattered, but as we proceeded the ranks closed up and it became more compact. Many of the Indians leading their horses, advance on foot, keeping well up with the mounted men. Here and there I see two of them mounted on a single horse and leading two others; the former will be turned loose when we approach the buffalo and its riders will make their hunt on fresh horses.

On we go, mile after mile, and still no sign of halting. At times the pace is slackened as we ascend some high bluff, and one or two of the leaders cautiously peer over it to see if the game is in sight. In front of the line ride at regular intervals the "Pawnee Police" so called, whose duty it is to restrain the more ardent, and those whose horses are fastest, until the charge is made; so that the game may not be frightened too soon, and so that all may have an equal chance at it. Very deliberately they advance, checking their impatient ponies which snuff the chase and are eager to commence it. Sometimes a restive horse carries his rider too far forward and the latter is sternly warned back by the nearest of the leaders. And woe to the luckless wight that fails to heed such a warning. The power of the "Police" is absolute during the hunt, and if an order is disobeyed or neglected by the delinquent, be he white or red, of high degree or low, may be knocked off his horse with a club and beaten into submission without receiving any sympathy even from his best friends.

Six, eight, ten miles have been passed over when a brief halt is made. The game is in sight, and when I ride up to the top of the high bluff where the leaders are congregated, I see on the prairie four or five miles away clusters of dark spots that I know must be the buffalo. Presently we start again and change our course so that a range of bluffs conceals the game. By this time all the Indians have mounted and are pressing as close behind the "Police" as they dare. The wet flanks of the ponies glisten in the declining sun, and dashes of white foam flake their breasts as with outstretched necks and ears thrown forward they gallop along, showing as much excitement as their riders. The latter sit their animals like Centaurs, their long hair streaming out behind them and lifting at every jump of the horses.

At length we reach the top of the last ridge and see the buffalo lying down in the creek bottom a mile beyond. The place could not have been more favorable for a surround had it been chosen for the purpose. A plain two miles broad and intersected by a narrow stream, is encircled by high bluffs up which the buffalo must toil slowly, but which the more nimble ponies can ascend almost as fast as they can run on level ground. As we commence to descend the face of the bluff, the pace is slightly accelerated. The Indians at either extremity of the line press forward, and its contour is now crescent like. Men and horses commence to evince more excitement, but the five hundred buffaloes reposing below us do not seem to notice our advance. A few wiley old bulls, however, that occupy the tops of the lower bluffs, take the alarm and commence to scud off over the hills. At last when we are within half a mile of the ruminating herd a few of them rise to their feet, and soon all spring up and stare at us for a few seconds; then down go their heads and in a dense mass they rush off toward the bluffs. As they rise to their feet the leaders of our party give the signal, and each man puts his horse to its utmost speed. The fastest horses are soon among the last of the buffalo, but still their riders push forward to try and turn the leaders of the herd and drive them back into the plain. This they in part accomplish, and soon the bottom is covered with the flying animals. They dash madly along and the trained horses keep close to the buffalo without any guidance, yet watch constantly for any indication of an intention to charge and wheel off, if such intention is manifested. The Indians discharging arrow after arrow in quick succession, ere long bring down the huge beasts and then turn and ride off another.

Lute, Jim, and myself each shoot three or four and then we come together on a little hill that overlooks the valley and become spectators of the scene. Soon the chase is ended, and the plain is dotted with dark objects over each of which bend two or three Indians busily engaged in securing the meat. Every ounce of this will be saved, and what is not eaten while fresh, will be jerked and thus preserved for consumption during the winter. How different would have been the course of a party of white hunters had they the same opportunity. They would have killed as many animals, but would have left all but enough for one day's use to be devoured by the wolves or to rot upon the prairie.

As we ride slowly back Lute beguiles the way by relating to us some of the traditions of the Pawnees, to which we lend an attentive ear. Camp reached and supper over, we turn our attention to the Indians. There is great rejoicing among the company to-night. Some roast the delicious hump ribs, and some broil the heart and liver. Many stuff the intestines with fragments of the tenderloin and boil them, thus obtaining a most delicate soup, and others take the great marrow bones and greedily feast upon the luscious contents. And so the evening wears away, passed by our little party in the curious contemplation of a phase of life that is becoming more and more rare as the years roll by, and by the Indians in feasting and merriment, and when at last we seek our couches and drop off to sleep, the Pawnees are still pegging away at the buffalo meat right manfully.

A CRUISE TO WINDWARD.

BY J. NEWTON WILSON.

THE British flag was gracefully floating over the dark walls of Fort Charlotte one breezy morning as we quietly glided from the harbor of Nassau, bound for a trading voyage to Turk's Island and other small seaports lying in our track. Our craft was a very fine Bahama wrecker, of schooner rig and clipper-like appearance. Her tall, tapering spars bespoke for her somewhat the appearance of a slaver, which in truth she had been at one time. We were not many hours in rounding the eastern shores of New Providence, and ere the sun had set below the western coral hills the silvery islands were rapidly vanishing from our view. I kept the deck till eight bells were struck, and then went below, leaving the pilot and mate in charge of the watch. I sprang into my bunk and flew to the land of dreams, nor did my eyes wink again till the loud clang of the breakfast bell caused me to arouse myself and partake of the savory turtle stew that was neatly served up to the table by a Spanish darkey. After doing ample justice to this favorite West India dish, I lighted a cigar, and taking my cup of steaming coffee proceeded to the deck. The morning was balmy and refreshing in the extreme. No land was visible, but close on our starboard were to be seen the snowy sails of sponging sloops. Our little vessel was dancing prettily over the foaming waters, for the wind was fine and free. Flying fish darted from the blue depths of the sea, and, as it were, played tag for an hour. Towards noon a negro from aloft cried "Land ho," which soon appeared on our lee, when we gave free sheet to the flowing sails, and a narrow neck of land loomed before us, and the beauties of habitation greeted our eyes, and noon found us anchored at Long Cay. Here I had letters to a Mr. F—, a gentleman much esteemed by the natives of the Bahamas. He was one of those jolly, good-hearted fellows that I have met with once and a while through life. His dwelling was a delightful and cozy little stone building, surrounded by a latticed piazza, and being on a hill overlooked the broad ocean before it. My host's good wife made me feel perfectly at home.

One morning my friend saddled two Cuban mustangs, and we rode on these spirited little animals for miles away to the extensive salt lakes. This was a novel scene, the waters covering as much ground apparently as Loch Lomond, New Brunswick, and of a blood-like color. These ponds, as they are styled, are divided into numerous small spaces by low stone walls, and are called pans. Here the waters, which are not six inches deep, become curdled by strong dry winds, and the salt is then raked by the natives in heaps, and after being thoroughly bleached and drained is wheeled in hand barrows to the margin of the lake, and is then carted by mules to the place of shipment.

After transacting my business at this place I hastened on board my vessel, and soon we were running along before the trade winds towards the island of Inagua, and arrived at Matthew Town next day. Here I sold more of my goods, and passed a pleasant evening at the residence of the American consul. The houses at this town were nearly all of stone, with latticed balconies adorning those of the Government officials and some others. It presents quite a lively appearance from the sea, and its custom-house officials, who are as black as the eyes of "Black-eyed Susan," dress most stylishly. Polished brass buttons and fine navy blue gave them an appearance that would invite all nations to respect the officials of Her British Majesty's Government. Here I found a stout, genial old allopathic doctor. He was a liberal fellow, and was never known to throw a drop of good grog over his shoulder.

One morning, with the thermometer at about ninety-two, we started, gun in hand, among the flamingoes. We knocked over some young ones as they flew in line like a body of English red coats charging bayonets. Their reddish feathers would have added fair stock to a millinery establishment, and, like the Ashantee warriors, their beaks or noses were Romanish, their legs and necks long, but withal muscular and full of vitality. There is plenty of game in the West Indies, and I have often bagged enough to reward a hard day's toil, among which was the stilt plover, pigeon, snipe, common quail, ring-tailed dove, and last and best of all, the *gaulding*. This bird is about the size of a bantam hen, and flits among the mangrove trees in lagoons and swashes just before dark.

We again set sail, and shaped our course over the Cayas Banks for Turk's Island, our destination. The scenery in crossing the limpid waters of these shoals is of the most romantic character. For more than a hundred miles can plainly be seen the bottom of the sea. Countless numbers of fish might be observed swimming busily among the sponges, near which exquisite shells were strewed, but suddenly the dark form of a murderous shark rushes forward, and they dart for safety beneath some friendly coral ledge. After crossing these banks we hauled aft our sheets and stood for Turk's Island passage, and were soon moored near the Grand Turk, or king of the West India salt islands. This island is nothing more than a barren rock. The vast mounds of salt along its shores remind the northerner of the snow covered hills of his native land in winter. About one eighth of the population are white, and form the chief portion of the business community. Some extensive general stores adorn the wide street that ranges

ong the seashore of the town, and many fine dwellings and on its salt covered suburbs. Here the place was filled with refugees from Hayti and St. Domingo. What ill, muscular fellows they were—their skins quite dark, with Arab features, and long coarse hair, glossy and black. Many of them had taken part in the fierce struggle which was raging in their unhappy country against the Spaniards. One of them told me he had killed in battle three Spanish officers with his sword. Said he: "My English young friend, Spaniards bloody cowards; they cut your throat in the dark; they like to grind knife and feel the edge, but they cannot stand the swordsmanship of my countrymen." At Turk's Island I sold the balance of my cargo, and purchased anchors, spars, and wrecked coffee. I also received on board some gold and silver—over one thousand pounds sterling—to be delivered by me to sundry merchants in Nassau.

I now weighed anchor, homeward bound; the day was sultry, and accompanied by heavy thunder showers. Towards night the weather threatened ill, and we took shelter in a place called East Cayco Harbor. Here the speckled mosquitoes drew the blood from our necks and faces most thoroughly, and many was the thick skinned negro who groaned under their weight. Here we obtained two barrels of beautiful fish of many varieties.

Again we weighed anchor, and with a glorious breeze, about four points free, flew on towards the Bahamas, and made a call at Rum Cay, where we took aboard some passengers, and four days after this we passed Cat Island, or better known abroad as St. Salvador. We are told that Columbus first saw it in 1492, but how he got to it without dashing against some of the other islands to windward of it I don't know. Perhaps he had a pilot on board like myself, that kept him clear of the rocks. This long snake-like island is the most valuable fruit growing district of the Bahamas, and exports pineapples, bananas, and oranges to the United States. During my stay in the Bahamas I always "went in" for plenty of watermelons, bananas, sugar apples, sappadillis, and guavas. I have often seen a bunch of bananas weighing over a hundred pounds.

The most curious little resident I ever met with in the West Indies was the soldier crab. Its limbs are remarkably small, and it handles them with all the machinery of a well ribbed umbrella. When frightened it silently stows away its limbs, lays low, and keeps cool. I am told that every year they march down to the sea by thousands to spawn and change their shells. I have heard of their being used in Jamaica for soups, but in the Bahamas they are not considered fit for human food.

Two days more and we sighted New Providence, having been absent about forty days. We sailed through the eastern passage, and handsomely glided past the massive old forts, and were soon at anchor abreast of this beautiful city of trees; but its glory was departing, for Fort Sumpter had hauled down the stars and bars, our friend Uncle Sam had conquered his brother, and peace reigned again the Union; but empty warehouses and well-filled graves stood as monuments in New Providence to account for some of the nett proceeds of the sum total of the "Yankee war" and yellow fever.

"TURKEY SHOTS."

EDITOR FOREST AND STREAM:—

Who of us, country-reared and with sporting proclivities but recall with pleasure those days when, word previously given out, or more often a notice in irregular characters, (suggesting strongly that "the schoolmaster was abroad") posted up on the door of the bar-room or grocery store setting forth that on a certain day, (generally Thanksgiving or some day just before or between the holidays), there would be "a Turkey shoot" at the corners, or at some well-known tavern. How the announcement used to arouse our juvenile enthusiasm! Then were rifles looked to, bullets cast, patches cut, and all the minutiae of arrangements made for the match. The crack shots for miles around would be sure to be on hand, and many that were not shots at all, for there would be other fun always connected with "a shoot."

It is many years since we ran our eye along the tube at a turkey, but we presume those things are conducted about the same now a-days, varying in particulars perhaps in different localities. In one section of the country the bird is secured in a box with only his head and neck exposed through a hole on the top, and at a distance of eighty yards the shooter must kill the bird "off hand," or at two hundred yards and off hand, the bird being tied to a stake and in full view, it is only required to draw blood to win the prize. It could easily be seen when a turkey was hit by its flopping or jumping up, but sometimes a turkey would move even when the bullet came close, and only threw snow in its eyes, then if shooting at a long distance and the shooter had a friend on the watch to rush up and examine the bird, it gave occasion for fraud or thumbing, as they call it, *i. e.*, drawing blood with thumb nail or a knife even, and claiming the bird. Then often followed angry and sometimes very vehement discussions.

Up our way a dead rest was allowed and invariably preferred, the object being placed at a distance varying often according to the timidity or meanness of the setter up of the birds. I can recall the time when sixty rods, (measurement then was always made by rods instead of yards), was considered fair; but as rifles reached a higher degree of accuracy at long range with their globe sights and other im-

provements, ninety or even one hundreds rods were not considered out of the way. How well I remember the excitement that was created when Hi. R—, a celebrated turkey shooter of that region, brought on the ground his new Ferris rifle, with its globe sights and patent muzzle, (new things in those days), and what exclamations of wonder were uttered when Lance—who though but a boy then, but known as a good shot, after having got his range picked off seven of "old Pinto's" turkeys in succession.

Old Pinto was a character in our parts, and known far and near for his speculating propensities, and withal was considered not over scrupulous in his business transactions, being decidedly close and not disposed to give the boys as they thought any more show than he could possibly help.

The right thing to do was to have the turkey tied to the end of a rail or short stake with a cord of a few inches, giving the bird full play to stand erect and even to walk around a little, and that, too, on or against rising ground, in order that the shooter, when he missed or at the first shooting, might see where his balls struck and arrange his sights accordingly for his next shots. This of course, especially in a windy day, would be an advantage to the shooters; but at one hundred rods or more, they claimed it, and it was considered right.

But old Pinto could not often be so magnanimous, but would not only have small hen turkeys, often speckled or nearly white, and therefore difficult to be seen against the snow, but would set them down half way behind the rail, or as he once did, (and that created a big breeze among the boys), tied his bird on top of a crockery crate; and moreover, told us it was only ninety rods off when it was one hundred and more.

That turkey stood thirty-six shots and was then killed by a hilarious hiccuping Hibernian, who never shot a rifle before in his life. He had come reeling out of the tavern, and approaching Col. B., who was driving down his ball for his tenth shot, he said: "Kurnel, be jabbers, yees promised me a schot the day." The Colonel, as well as all of us, were pretty mad, for the arrangement had been consented to previously, that that turkey must be hit before any change should be made. Turning around, the Colonel said: "Well here, Jimmie, if you will kill that pigeon," (it was a small speckled hen, not much larger than a pigeon, and being the first bird, and that too on a crockery crate, none of the boys had got the range), "you shall have all the whiskey you can hold."

Jimmie took the gun, and instead of lying down at full length on the slab, one end of which rested on the lower board of the fence, the other on the ground, thus giving a dead rest, he walked up to the fence and placing the barrel on the top board, about breast high, after swaying about a little, pulled the trigger, and to our utter amazement, he shot that little bird through at the butt of the wings.

It was an extraordinary chance shot, of course, but it was a big thing, and Jimmie was the hero of the day. I don't think it was a good thing for Jimmie, for with the treats by all hands, it was the occasion of his taking in a very full cargo before night. After that, of course, the crockery crate was kicked one side, the birds were properly put up and everything went off smoothly.

All this time fun was going on in the bar-room. Those who were not shooters, but were not the less anxious to carry home a roaster, were trying their hands at the raffles. Ah, with what intense anxiety the boys would watch the turn of those deceiving dice! Once we remember when the big turkey was up, (an eighteen pounder), forty-six was high, and had so stood for some time, when it came little humpbacked Mike's turn, (Mike was the only son of the washerwoman, "and she was a widow," and the Doctor had given him a sixpence to try his luck). As his first raffle proved to be three sixes, his next two fives and a four, leaving fourteen to tie, with what eagerness we watched for the result, and as the ivories rolled out two fives and a six, what a shout went up, and then when little Mike trudged off home with the turkey on his shoulder, nearly as large as himself, it was a fit and satisfactory finale to the day's sport.

JACOB STAFF.

A "WATCH ON THE RHINE."

ST. BARNABE, Canada, 1873.

EDITOR FOREST AND STREAM:—

We had been told such marvelous stories about the abundance of game here that we made up our minds that if we once got started nothing would stop the slaughter but darkness or lack of shooting material. Friday night we scoured the town for guns, and laid in our stock of ammunition, which, by the way, is a very important part of a hunter's outfit. I calculate that our stock averaged about as well as that of any party that has fitted out since the days of Daniel Boone. It was near eight o'clock A. M. when we left St. Barnabe and plunged into the mud and primeval forest. Our party consisted of Mr. Roloff, myself, two Canadian guides in full war paint, and two dogs. Immediately on striking the woods we threw ourselves into attitudes ready for instant action, and I am sorry to say we had no occasion to throw ourselves out of them, only as the position became tiresome and obliged us to change hands for a rest. In fact, we travelled from early morn until two P. M. without seeing a living thing twice the size of a June bug, and it was astonishing how fast I lost interest in that raid after twelve o'clock. I begged one of the guides to throw himself up and let us try him on the wing, but he flatly refused. Nothing presented itself to relieve the monotony but certain fluids, that suffered continually.

At a quarter past two P. M., while sitting on a fallen tree, I thought of my dream of the night before, and then the mortifying fact dawned upon my benighted mind that dreams always go by contraries.

As it was then late, and we were about eight miles from any living thing, we deemed it best to strike civilization as soon as possible, and with this thought uppermost in our minds we turned in the direction of St. Barnabe. I don't know how the others felt, but I was growing savage. I was determined to shoot something before I got home, and when we were so near St. Barnabe that I knew where I was, I left the party and went into business for myself, and it came very near being a grave mistake. Shortly after we separated, as I was making my way through an opening in the woods, I was startled by hearing a loud grunt and something run. I was frightened. I thought of bears and panthers, and a cold sweat fairly stood on my gun barrel. I buttoned my coat around me to keep from shaking to pieces, and cautiously moved away. In doing so I discovered the cause of my unmanly agitation. It was standing about five rods away, and was nothing more nor less than a hog; but such a hog I never saw on hoofs before. He looked as though he had just returned from an expedition in search of Sir John Franklin, and had endured the privations and hardships of numerous Arctic winters. Why, you could have cooked him bodily and he wouldn't have produced enough grease to lubricate the balance wheel of a Howard adjustment. The idea of being frightened by a hog roused my indignation to such a pitch that I determined to teach his hogship a good lesson. Accordingly, I levelled my Canadian stub twist in his direction and covered what I could with my sight, and then, without a word of warning, I introduced to his notice about a quarter of a pound of No. 8, backed up by a reasonable amount of projective material. To say that the swine was taken by surprise doesn't express it. For about a minute I guess he thought King William had made another forced march on the Rhine. Eleven seconds later, hatless and gunless and senseless, I was ruminating on the mutability of human calculations among the branches of a small oak, whither I had taken myself rather suddenly to escape the fury of that hog's onslaught. Looking at him from the tree, I never for an instant doubted but what that hog's whole soul was in the work before him. I never saw a more thoroughly interested specimen of hog anatomy in my life. He peeled the bark off the tree with his tusks, and ploughed deep furrows in the dirt and leaves directly under me. From a base ball point of view, that porker did the finest bit of fielding I ever saw. I thought of George Wright, Ros. Barnes, and other noted players, but the hog suffered by comparison. I tried to enter into conversation with him, with the view of getting him to play in Boston next season, but as near as I could make out, he was *already engaged*. I didn't relish the idea of remaining in that tree long, for I was bareheaded, and feared sunstroke; besides, I never took much interest in the lumber trade. But deliverance came from an unexpected quarter. It appears that when I fired one of the dogs left the party and started in the direction of the sound, thinking, no doubt, I had discovered game, and so I had. I would give all I possess in the world to know what that dog's feelings were as he came upon the scene and saw me up the tree and the hog standing guard. I was completely overjoyed, and came near falling out of the tree into the jaws of death, or the hog's. However, the grunter now turned his attention to the new comer, and I made up my mind that if that dog didn't want crape on his front door in the morning he had better leave me to my fate, but the result clearly proved the truth of Bill's remark, that "there are more things in heaven and earth than are dreamed of in our philosophy." The dog seemed to take in the situation at a glance; he also noted that he had got no slouch of a hog to deal with, and then commenced a series of movements between the two which for grandeur of conception and rapidity of execution have had no equal. The highest ambition of that dog at this particular moment seemed to be to get in the rear of the hog, and the hog was just as anxious to keep his enemy in front, and for me to describe the movements of the two in this contest would require a volume as large as the corner-stone of the new post office. I should think that fifteen minutes had passed when the hog showed signs of distress, and he was evidently contemplating one of those masterly retreats that made McClellan's name so famous, when an unexpected movement on the part of the dog brought the idea to a head at once. The dog had been watching for the chance, and when he caught the hog off his guard he made a lightning spring and fastened to one of the hog's ears, and that settled the fate of Europe on that field. You could hear that hog give vent to his injured feelings for miles as he crashed through the woods, dragging the canine with him. I lost no time in getting out of that tree, and gathering up my hat and gun I commenced to put real estate between me and the scene of the late conflict in a somewhat marvelous manner. Before I got home the dog joined me, and he seemed as modest and unconcerned about his victory as I was in not saying anything about it when we arrived. I don't care to go hunting here any more; it isn't a happy pastime. From your unhappy

For Forest and Stream.

IN CAMP.

SLOW down the mist the dying sun
Drops to his crimson bed,
And sad, weird voices of the night
Lament the day as dead.

The moon climbs up above the hill,
In golden garments bright,
And marks the ripples on the lake
In lines of silver light.

Amid the trees strange shadows glide
Around our flickering fire,
Going and coming as the flame
Falls low or rises higher.

Like sentinels above our camp,
The shattered hemlocks stand,
Gray warders, who a hundred years
Have looked o'er lake and land.

And softly through the silence comes
The outlet's distant roar,
And mingles with the rippling waves,
Along the sandy shore.

One flashing spark, the fading fire
Throws up, and then is dead,
While forest breezes soft and cool,
Blow o'er the hunter's bed.

FERN FLY.

AMONG THE ADIRONDACKS.

SUNRISE ON LITTLE TUPPER'S LAKE.—A DEER HUNT AT ROCK
POND.—CHASE AFTER A BUCK.

EDITOR FOREST AND STREAM:—

One day last September, just as the gray dawn was breaking in the east, and before objects became barely discernable, I awoke and throwing my blanket aside sprang from my hemlock boughs, and pushed back the folds of the tent and stepped out into the morning air. How wondrously calm was all nature! So peaceful and quiet had been her slumbers here in the wilderness that night. The wind but barely stirred the leaves; the wavelets lapped the shore at our feet with a soft rippling sound, and across the waters in a path of silversheen the moonbeams danced, while the moon, full orb rose right royally from behind the dark sides of old Buck mountain, and held court with her bright starry satellites over forest and stream. Soon the scene shifts. From the heavens the morning star, so lately sparkling like gold, is withdrawing its lustre, and the dark of the morn is becoming a pale gray, and surrounding objects are becoming visible; a warm pink flush suffuses the east; higher it mounts, and the day is fairly breaking. Our camp is now astir. The guides begin to gather logs; the axe soon divides them; some splinters are whittled, and soon a bright, cheerful flame is dancing through the fuel. The water is soon boiling, the coffee is made, and with some cold biscuits and fried potatoes, we despatch our breakfast, and then unchaining our hounds we enter the boats and are once more dancing over the rippling waters of Little Tupper toward its head, where a party encamped there are to join us in our hunt. The sun has risen above the mountains and is flooding the forest world with glory, painting with purple and gold cloud and mountain, and running around their edges golden lines, while others glow with crimson fire; and through this floating sea of clouds gleam all the colors of the rainbow. Such a mass of fantastic shapes, such changing hues, and yet so beautiful! I would that I had my paints and brushes with me that I might hastily sketch this wondrous scene, this most rare cloud effect in sunrise. But no, on we must push as the sooner we get our dogs started the better, and I turn my back to the glorious cloud palace, with its jewelled lines, and feel the breath of the fresh, pure morning blowing in my face, as our Saranac boat is swiftly propelled over the water by the strong arms of Hank, my trusty guide. How sparkle the waters, a ruby tint upon each wavelet! How liquid and transparent they appear in the morning glow! Up towards the head a fog bank lies cold and gray, its upper edges bathed in faint coral hue. On we dash, and as we round Watch Island we find the wind freshening, and out toward yonder point the waves are beginning to dash. "We'll have a windy day, and I rathier guess we'll get some rain." I glance at the heavens as Hank speaks, and find the clouds gathering and fast losing their bright, gleaming colors, while those of violet, salmon and gray are taking their places, and over to our right spanning the sky is painted a rainbow, and the old saying comes to mind, "rainbow in the morning is the sailor's warning." The loons are flying, and their clarion call echoes like a bugle blast from mountain to mountain. "That ere wind's risin' fast;" and sure enough Hank's words proved true, for in a few moments we had hard work to make headway against the combing, crested waves. On we pull off from the lee shore, and upon rounding the point at the head, see lowering in a dark gray mass, far over Smith's Lake, a shower.

Reaching the other camp, we find them all astir and ready. "Well, boys," says Pliny, "we had better wait awhile till we see whether it's going to rain or not; 'taint no use for me to put out the dogs if 'tis." And we wait; and now the rain drops patter on the water which has become quite tranquil, breaking the surface with myriad white spots; and now the cloud is passing to the westward, and through flying clouds we catch glimpses of the blue sky. "Well, I guess we'll try it;" and as the rain has ceased two boats start for Smith's Lake and Charley Pond, another for Salmon Lake, while the other two go one to Rock Pond and the other to the island near the inlet of the lake. I also am to watch Rock Pond, and taking the dogs,

we start. Hank steps into the boat with me, and off we go up the inlet. Pliny meanwhile takes the other dogs and plunges to the west of the camp. Rowing along up the reed fringed banks of the stream, we breathe in great draughts of the pure, fresh air, and gaze with delight upon the deep amber waters in which is reflected as in a mirror the long brakes and ferns, sky and clouds. The broad leaves of the lily lie floating on its bosom, upon which lay contentedly here and there some frog or huge dragon fly, the former blinking at us comically as we pass, the latter waving its wings to and fro glistening in the sunlight.

From the bushes of the mountain ash with its scarlet berries, from the showy stems of the golden rod, and from reeds and rushes so brightly emerald, drip the crystal raindrops, glistening like pearls in the bright beams. "Look there, Hank; just see how the deer travelled through here last night," I exclaim, as in the mud and sand all around us are seen the prints. "The shore is cut up like a sheep pasture." "Golly," says Hank, "aint that an all-fired big feller that made that there huge track; as big as an ox." The lily pads were broken off where they had fed, and the bushes beaten down all around. The stream is very crooked and narrow and shallow, except here and there where at a bend lies a dark pool, where the trout love to lie. We at last arrive at the "carry," and Hank and I shoulder the boat and contents, and walk over it, and we did it without a slip or stumble over the old gnarled roots and rough stones that obstructed our path. Launching the boat again in the stream, we put off, now running upon some sunken log, now grating over a concealed rock, tugging and pulling, we at last emerge into Rock Pond, a beautiful sheet of water with an island almost in its centre. I row to my watch ground on the point near the outlet, thus commanding a view of the Pond and the "runway" near the carry. Away down toward the westward, near the outlet of Salmon Lake, upon a small rock lies the boat of H. and his guide, a mere speck. Farther on, a mass of purple haze, loom the mountains of the lake, while all around is a cordon of forest primeval. The red man has disappeared, as also the solitude-loving moose and beaver. By the far back lakes they still exist with the wolf and panther; the two latter, with the bear, make a tour now and then to this region.

The pond now lies quite calm, "the calm before the storm," as afar over the woods is heard the hoarse murmur of the wind, like the roar of the sea, and out to the west the mountains are hid from view by a thin gray veil, as the rain comes steadily on; and now the island is shut from sight, and the patter of the rain over the trees and water sounds like the foam of some distant cascade. "Ough! this is pleasant," I exclaim, as the storm comes down upon me, wetting me through. I wrap my rubber blanket as closely around me as I can. "I hope they haven't started the dogs yet." How dismal now is the scene; everything gray and leaden; but I think it nothing more than a shower; still it comes down fast, and I have to stand and take it. Ah, there it a streak of blue sky again, to the west. Not so bad a day after all. And the wind lulls, and the rain ceases to patter, though all around me is wet and dripping. I throw off my blanket and brush the water from my rifle, and—ah, isn't that a dog? Away to the north I hear a faint hum like a bee. I listen. Another hum; and another and another. Fast it booms and nearer. Ah, sweet music! and now the deep voices of the hounds are heard ringing out clearly on the mountain not two miles away. Nearer and nearer. The chase is warmer as they open out quicker. Now look out, sharp. The deer may be in the lake any minute. I await with breathless expectation, the blood coursing quick and hot through me. Ah! A bound in the bush, a crash, and into the pond leaps a large doe. I crouch down to let her swim out far enough to cut her off. Her ears are working back and forward; she swims out but a few yards, turns, and makes for shore again. I ran through the woods towards the spot which she is making for, in order to frighten her out again, as I desired to make her swim out to H., after I got into my boat, which I could easily do, as he was very desirous of killing his deer, and I had killed two old does already in the past few days; but though I ran with all my might she was ashore before I arrived, and we met almost face to face. With a bound like lightning she dashes by me on the beach. I fire, but it is like shooting at a rocket, and I miss, and she is out of sight across the point. I take a long breath and wish I had fired at her at once while she was in the water. But no matter; "make the best of it." And now come down the dogs hot and fierce. I call them; "here, Spot, here Drive," and show them where the deer came ashore; but no use; they think the deer swam into the lake, and will not follow. And now, crashing through the brush, comes Hank, and he hastily inquires where the deer went in, and he tries to put the dogs on the track, but no use. "Durn the dogs," says he, "that's all-fired mean." I jump upon my watch ground and look over the pond. What is that swimming out there by the island! A black speck! Is it moving? Yes. "By Jove, Hank, there's another deer!" To make sure, I level my field glasses upon it. Hank seizes them and says, "where?" and looks through them quickly, and with a "by golly, so it is; get into the boat quick," we dash out, and though the distance is about a mile and a half, we overhaul him fast. "Why don't they start out from the island," (meaning H. and his guide,) I exclaim, as they are seen standing upon it watching us, apparently wondering what we are rowing so fast across the lake for. "Don't see the deer," says Hank. The perspiration rolls from his forehead as he pulls with all his might, and we dash swiftly along. "A big buck," I cry, and Hank re-

plies, "Guess it's the same buck I put Watch after up in the slash." And now we near him; truly a big fellow, with a fine pair of antlers. "Just the one I have been looking for the past two weeks; how splendidly he will look mounted for a hat rack in my hall, eh, Hank? Can't let H. have him anyhow; if 'twas a doe 'twould be a different thing." Now the buck sees us and makes for the point he is near, (and which I was afraid he would reach before we started as he was heading for it.) "Faster, Hank," I yell, "he'll get ashore," and Hank tugs faster, the water flies, the oar blades bend, and the boat fairly jumps along. Ah, the deer is turning from the point; he sees he cannot reach it, and makes for the marsh. We near him; he turns again for the Island; around again goes our boat. Ah, there comes H., his guide rowing with all his might; but he can't overtake us, and the deer is ours, for the law of the woods is "who kills the deer to him it belongs," and so we dash alongside. What a splendid big neck. "Hold, Hank; keep the boat steady," I say, and aim at his back just below the neck. I fire, but on he keeps. I fire a little higher. "He's a tough old fellow; shoot him through the neck," says Hank, and I put another cartridge in and aim and fire. I send the ball through his neck, his head falls over and he is ours. We tow him ashore, and it is as much as we two wish to do to drag him on the rocks. "A buster; an old chap; will weigh 200 sure." "I'm satisfied," I replied. "Ah, there is Watch down at the runway where the buck came in." A white spot is seen across the lake in the slang or marsh, and we row across and take him, and call him, "good dog, good fellow, and rowing back to our watch ground, we built a fire, and each taking off his clothes, while the other watches, dry them and feel better.

The afternoon wears away. Now and then, afar off toward Salmon and Smith's Lakes, we heard the notes of the hounds, waking the woods with their music, and once the chase came so near we were all expectation to see the deer enter the lake; but presently it winds, and off up towards Salmon Lake it dies in the distance; and after waiting an hour or so longer, until near five o'clock, we enter our boat and with our game and hounds find it heavily weighted. We reach camp after dark, hungry and tired, but pleased with our day's hunt. And so go the days, happy ones, full of golden hours, but we must soon turn our faces homeward, after painting a few more scenes to show my friends glimpses of this wondrous forest world up here in the Adirondacks.

C. C. MARKHAM.

HONK! HONK! HONK!

CHINCOTEAGUE ISLAND, Dec'r 19th, 1873.

EDITOR FOREST AND STREAM:—

I had been stopping for several days with Mr. Griffin, in Accomac county, Virginia, awaiting Jake's coming, and was somewhat annoyed at my gunner's delay in not turning up. However, on the 3d of this month, near the cotton field at the end of the garden, I heard honk! honk! honk! and rushing to the house for my gun, was making for the open fields near the shore, when who should I meet but my stalwart gunner, Jake, in person. My first question was, "are there any geese yet at Chincoteague, Jake?" His reply was reassuring to a degree. "Yes, sah; lots of 'em; my boat is on the creek, and by the feel of the wind, I s'pose we might make Chincoteague to-night." I was somewhat doubtful in regard to the weather, not relishing exactly a thirteen mile sail in a cranky boat of a stormy evening, but on Jake's assuring me that he "was bound to do it under three hours, if I didn't mind getting jess a little wet now and then," I put on my water-proof, took my two guns, blankets and valise, and consigned myself to Jake's care. One hour out in the bay, I had rather good reasons for regretting my voyage. The wind blew from the northwest, "a good wind for geese," as Jake remarked, "but a mighty unsartain one for folks in a boat." The water broke over our craft repeatedly, the spray driving with stinging violence against my face, though thanks to my water proof, my body was perfectly dry. The gun cases I had lashed under the thwarts, and the ammunition, being in the fore-castle hole, I knew would not be damaged. The wind came in so strong that Jake reefed close, but instead of three hours it was nearer seven hours before we made Wallop's Island. A few hundred yards back of the inlet, on a point, I was welcomed by one of Jake's colored friends. In fact I found every preparation made for me. No sooner had I thrown off my wet wraps than supper was announced, and a glorious one was it. Imprimis, a brant stuffed with persimmons; secondly, a slice of baked drum-fish, some fried spud; lastly, a roasted coon with sweet potatoes, all flanked with flapjacks and corn pone. How will this do for a Chincoteague supper? But gunners always do live on the fat of the land, providing they can accommodate themselves to circumstances. In the present case Jake and I were old friends. With these colored people of the better class, for Jake had been the body servant of an excellent master before the war, money was no object. What Jake wanted was to be treated with that respect which he was entitled to, and which he fully merited for his faithfulness and honesty, not counting his sportsman-like ability. Jake's invariable price is \$3.00 a day, including stools.

I turned in and had a comfortable night. Next morning I was up at daybreak, it wanting about an hour to flood tide. Isaiah, Jake's friend, had four live geese stools and ten pairs of decoys. They have no blinds at Chincoteague; we therefore made the boat the blind, easily accomplished by nailing cedar brush, some two and a half feet high all around the boat. The live geese stools were arranged on a platform of wood, a kind of raft, a piece of leather with

string to the geese, keeping them to the raft. In order to secure the platform from floating off it was anchored with a brick at each end. At each corner of this platform three pairs of decoys were placed, the wild geese being on the platform itself, with strings leading into the blind boat.

I now instructed Isaiah to take the live geese stools and platform in his boat, to place them about a hundred yards forward of some sedge grass, and to wait there until we came up with the blind boat. It was still pitch dark. While this was being done, and the tide was making up fast, Isaiah soon completed his task, and we rowed to where he was and took hold of the strings which were attached to the geese, which we fastened to the rollocks of the blind boat. Isaiah was now ordered by me to take his own boat to the Bay side and to scare up the geese and drive them in. I had hardly got through eating my breakfast before Isaiah had rapidly pulled around the point, and I heard him honking away merrily, Jake playing second fiddle. The first gray streaks of morning commenced to show the coming dawn, allowing me to look over my guns and arrange the ammunition, which was all in good order. I was using my swamp angel, (according to the judgment of some of your FOREST AND STREAM critics,) a 10-bore Snyder-Allen breech loader, and a muzzle loader, Greener, 8-bore. I had prepared my cartridges as follows: 5 drams of powder and an ounce and three quarters of single B, for the Snyder-Allen, and 6 drams of powder and full two ounces of B's for the Greener. There is no use of bringing pop guns down here. You must load up, as geese have to be killed and killed dead; for if you load as for pigeons, you waste your time in picking up wing-tipped birds, for geese, even when badly wounded, can swim with the tide faster than you can row after them.

Jake now commenced pulling the strings on the geese, imitating the cry of the live decoys, they fluttering their wings and making the spray fly. The decoy geese seemed to understand their business thoroughly, having doubtlessly taken advantage of Isaiah's instruction. Presently a flock of five geese came up on the wind out of the sedge, where they had certainly been feeding, and made directly for the stools. Now I wanted for once to understand the character of the live decoy birds we were using, and whether the wild geese would really approach close to them, so I determined to forego shooting the first flock and watch their familiarities. The new comers, they were young geese, absolutely alighted on the platform, and made advances to their captive friends, not honking, but whistling, the sound not resembling in the least the hiss of the tame goose. We were in the blind-boat, not more than thirty yards from the platform. They must have staid there fully three minutes, when all of a sudden, from some unknown cause—for we were in the boat hidden and perfectly still—they rose as if alarmed all at once, and with such a sudden jerk, using the platform to make their flight from, that they upset the platform and submerged for a moment our educated birds. I was so intent on watching the antics of the wild birds that I was slow in shooting. Though having shot geese in this neighborhood for the last fourteen years, it was the very first time I ever had an opportunity of noticing geese as closely, or of acquiring so much knowledge of their habits and actions.

They must have got away fully twenty yards before I could get the Greener to my shoulder, and I dropped two and wing-tipped one which I did not recover.

I have always observed that wild geese, when feeding, leave one bird on the watch, and most thoroughly does she perform the task. With outstretched neck, watching on all sides, and listening to every sound far and near, she keeps a wary guard. Nor does she look for a single worm or scollop, however famished she may be, till one of her companions sees fit to relieve her guard. Then the former sentinel sets to work at her feeding with an eagerness which shows that her abstinence while on duty was the result, not of want of appetite, but of a proper sense of the important trust imposed upon her. If any enemy, or the slightest cause of suspicion appears, the sentry utters a low croak, when the whole flock immediately run up to her, and after a short consultation, fly off, leaving the unfortunate sportsman to lament having shown even his head or the muzzle of his gun above the sea sedge grass.

About an hour afterwards—it was now high flood tide, and the wind blowing dead on shore—I heard Isaiah "honking," and to my delight saw him rise and drive a flock of as many as two hundred geese towards our side over the point. Approaching our stools, they divided into two flocks, one going apparently to the southward and the other answering the cry of our live stools. Here Jake showed some excitement, and asked me to allow him to use my Greener. "Take anything," I said. The geese came on swiftly to the stools, swept past them for a moment, then circled back, Jake jerking at the strings attached to the educated geese. The wild birds seemed to hesitate, but all hands honked away, and after a moment they all swooped down, and were just about alighting, not more than three feet above the stools, when Jake and myself fired off four barrels almost simultaneously. Eleven geese we killed outright, stone dead, they falling into the water with a loud flop; five we wing-tipped, three of which Isaiah secured in the pick-up boat. It took us fully two hours to gather the birds, and by this time the tide had fallen so much that the geese, although still flying in flocks, sought other bars and points to alight on. Towards evening we had a few more shots, but nothing of special interest, and I should not have written this letter save to record the excellence of the live stools, and the fraternization of the wild geese with our educated ones. Very truly, C. B.

Total bag, three days' shooting, 24 geese, 5 broad-bills, and 1 whistler.

EDITOR FOREST AND STREAM:—

To gratify the imperious demand of the public, to place my friend Captain Porgie in a true light, and allay, if possible, the torrent of ink shed which this remarkable case has produced in scientific circles, are the objects of this present statement. Captain Slocum W. Porgie is a modest man and a truthful witness, and his modesty and veracity have been shocked by the distortions and calumnies of friend and foe on this unpleasantly notorious affair. The action of certain illustrated weeklies in reprinting from an old portrait which had done good service before as the "Nathan Murderer," and been used with success as the "counterfeit presentment" of a "famous Sorosis presidentess," and labelling it now as "Capt Porgie, or the Demon Slayer of Sorghum Bay," he looks upon as a highly improper proceeding; nor is he less justly annoyed at the gratuitous insinuations of the *Popular Science Monthly* and *American Naturalist* to the effect that he is a "hoary-headed old miscreant," and a "blasphemous desperado." He says that such language almost implies a reflection on his private character, if not a positive misconception of his motives. For which reasons he desires to be set right before the public. Having ascertained that Captain Porgie was in the city last week with his schooner, I called at his hotel, the "Mariner's Haven," and found him engaged in a little private business at the bar of the house. He was discussing a modest luncheon of *lobscouse a la fearcas'le*, in company with a half dozen other gentlemen of saline appearance and flavor. The Captain is about fifty years of age, iron-gray hair, a steel-blue eye, and copper-colored nose, and a decided list to starboard.

Your correspondent opened the conversation by introducing himself as the commissioner of FOREST AND STREAM, and with the hospitable query:—

"Well, Captain, what's yours?" to which fourteen entire strangers simultaneously replied, "ruman'm'llasses."

We sought a private room, and the conversation proceeded substantially as follows:

Capt. P.—"Thankee; I don't care if I dew. That's consarned poor liquor. When I was in Cuby in '48, they was a Mexican feller from Seinfoogos had some pooty nice liquor, what he called 'pulque.' Ever drink pulque? Sho! Well, you see pulque—"

Your correspondent gently assured his narrator that strict temperance principles and patriotic impulses alike prevented his taking an absorbing interest in the productions, however fascinating, of a degraded foreigner; and besought the Captain to impart the true story of his adventure with the saurian of Sorghum Bay. We also, with a pardonable desire to impress the narrator, told him that our name was Cuvier, and that we thirsted for information of an ichthyological nature.

Captain Porgie.—"Glad to make your acquaintance, Col. Cuvier; well, I don't mind telling *you*, sir, though I don't care to speak of the circumstance to lubbers generally, after the way your papers sarved me. Some people don't know a true story when they hear it, and some people can't open their hatches without discharging a cargo of lies. But I ain't that kind, sir. I've been a sailor, man and boy, for forty year, and I never told a lie, outside of a Custom house in my life. That's why it gets me up when folks don't believe about that sarpint I saw last fourteenth of August, at 2,10 P. M., from aboard my own schooner, the 'Hiram A. Dodge,' in Sorghum Bay, latitude 43° north, and my first mate drunker 'an a porpoise in the fore'sle. A good deal drunker, sir. Capt Rampike was with me, too. Jotham Rampike, of the Sculpin Centre, and was going home after losing his vessel and seventy barrel of mackerel, good No. 2 mackerel, in a sou'wester off Cape Ann, with all on board except himself and a nigger cook. Saved by the mercy of Providence, and a Calais wood boat. He was a awful critter. Shed say he was an eighty barreller, half an acre across the bows and a hundred fathom from stem to stern, and had flippers like a walrus. He was lying across our bows, about a half a cable distant. There wan't a capfull of wind aloft, and the sea was as smooth as the bottom of a flap-jack. Rampike and me obsarved the critter clussly. He had a mane as high as the foremast, and was covered with scales like a mud turtle. Rampike was an old whalemen and always has a harpoon round his rigging somewhere. He wanted to sock it to him, and I let him try it on, though I knew it wan't no use. Sea sarpints ain't to be fit with harpoons, Mr. Cuvier, not that kind of sarpints. But I let Rampike have his way, for he's a dreadful set man, and he driv the iron into the critter's gills. Sarpint didn't mind it no more 'an a flea, but he just histed his bowsprit and surveyed us all over, kinder curious like, much as to say, 'I'm a noticing on you, gentlemen, and I'll make salt junk on ye, bimeby.'"

Then Rampike wanted to try him on with a shark hook; never see sich a lubber as that Rampike, for a man who sailed a morphiidye brig eleven year and *ought* to know suthin. Sez I, 'No, Rampike; I wouldn't be a consarned ijit, if I could help it,' sez I; 'Let's lighten ballast,' sez I, and get on his weather quarter.' So we took holt and emptied two sandbags, and I fastened a hank of beef to the kedge anchor, and then the balloon riz."

Cor.—"The balloon, Capt. Porgie!"

Capt. P.—"Sartinly; didn't I say we throwed out ballast, and of course the balloon riz. Oh, you didn't know we was in a ballon. Aint never been to sea? Thought not. Of course, allus keep a balloon aboard to rekonitre. Could n't get along 'ithout 'em no ways. Well, sir, as I said, it riz, and I drewed the grapnel just across the sarpint's nose

and he snapped for it like a shark. Bolted it; went anchor and all. Rampike jest set on the edge of the car and laughed fit to bust, and all the while the sarpint kept a chewin' and a chewin'; and bimeby he began to smell the trap and to lash the waves all around like a typhoon; and Rampike wanted to let drive at him with a round shot outen the old swivel. *Never* see sich a lunkhead as that Rampike. Whoever heerd of shootin' sea sarpints with round shot outen a balloon? Sez I, 'Capt. Rampike, I'll manage this discussion, if *you* please.' And I was going to give a turn on the windlass and bring the critter to close quarters, get him yard-arm to yard-arm, as it were, when I'm blowed if I didn't see the pizen reptile a swallowing that 'ere four inch manilla like prize candy, and stowing it away by the fathom till he was within twenty foot of our car! Rampike was standing there like he was struck dead, and had dropped the slow match into the car, and sot fire to the bottom of it. I see how things was placed immediate. That sarpint would make us sick in just four seconds and a half 'ithout we changed our moorings. 'Rampike,' sez I, 'follow me,' and I went overboard and Rampike after me just as the scaly critter was taking a mouthful outen the bottom of our car. He seen us jump, and aimed a lick at us with his tail, but the balloon being lightened up, went aloft like a rocket, anchor, sarpint and all, and when we clomb aboard the schooner there was a holler in the water like as if an earthquake had dropped there. We saw the balloon and the sarpint heading NNE, about half a mile high, and could hear the snake hissing and coughing and swearing like a volcano. And bimeby there come the all-cusseddest explosion you ever heard, and we knowed the fire had caught in the gas and set off the swivel, and given that reptile critter rather a surprise party. And that's all," said Capt. Porgie, as he shook the bottle mournfully.

We asked the conscientious narrator had he seen any remains of the shattered saurian.

"None to speak of," he said. Folks on shore had spoken of gathering up barrels of scales all over the coast, but he, Capt. Slocum W. Porgie, "made it a pint" to not place too implicit confidence in the statements of shore folks. He had found a painful absence of veracity and an unscrupulous disregard of accuracy in their narrations.

Such is the simple, straightforward story of one who has beheld the terrible denizen of the deep in his native element as well as in the less congenial sphere of upper air. The writer would gladly wish that he could here chronicle a fitting tribute from our savans to this gallant mariner, but to the disgrace of our common nature be it said, no such testimonial has been spoken of; on the contrary, his story has been greeted with suspicion or open hostility by those who should be first to greet him with pride and respect. Only one public functionary in this city has treated his story with any show of credence. The agent of the Society for the Prevention of Cruelty to Animals has placed sufficient faith in our hero's tale to indict him for causing the death of this sea serpent under circumstances of peculiar cruelty. Capt. Porgie confesses that such persecution and contumely are almost a source of irritation, and appeals to his fellow countrymen for justice. Shall he appeal in vain?

J. J. R.

[Notwithstanding the high scientific attainments of our informant, and his undisputed claim to veracity, we have an inkling that he has been *imposed upon*. The circumstances related are plausible enough, and the identity of the Sorghum Sea Serpent fully established by savans, but we have never known of any of this species of saurian being found in the latitude mentioned, and more than all, question whether the tractile force of mere deglutition would be sufficient to enable the creature to swallow a balloon under headway. We place little faith in balloons anyhow, or anything connected with them. However, we give the story for what it is worth, acknowledging its value to science if true, and, if not true, consoling ourselves that wiser men than we have been made the victims of wags without conscience, who to ensure the successful perpetration of a hoax, are contented to pass it off on poor credulous marines.—ED. F. AND S.]

NOT THERE.—The Canadian *Gentleman's Journal* is anxious in regard to the whereabouts of a large bear. We should most respectfully ask, if in Toronto they do as they are reported to have done in London, when a fashionable hair dresser hired the man who did no end of howling *à la bear*, as an advertisement for pots of bear grease? We produce the article in question, taken from our excellent Canadian contemporary:—

"Mr. Britton, butcher, of this city, has been carefully feeding for Christmas time a remarkably large bear with which he intended to create a sensation in the St. Lawrence Arcade. A well-known young sportsman had volunteered to administer a leaden pill to bruin yesterday afternoon, and having armed himself with his caribou revolver and a knapsack full of penetrating arguments, proceeded to the scene of action. The chain to the end of which the bear was supposed to be attached was lying loosely on the ground, and at the word—'All ready,' from the ardent sportsman, an attendant commenced to haul at the chain, but no bruin appeared at the end of it. A special force of detectives is now engaged hunting up the missing pet. Any information will be thankfully received."

—"The double barreled gun came safely to hand, express paid. You put it down at \$45; I have just refused \$50 for it. I am now going for a rifle, the kind will depend on my success in getting up a club. The paper is unexceptionable, and is worth the money without the prize. How do you manage it, to give a really good paper, and such handsome prizes?" St. Louis, December 22. See Prize List of the FOREST AND STREAM.

Woodland, Lawn and Garden.

SHELTER PLANTING.

IN recalling memories of woodland camps that have been tenanted through fair weather and foul, the sheltering effect of the unbroken forest always comes among the most gratefully remembered of all the camp associations; as having disarmed the blast of its fiercest power, and taken from sleet and storm their keenest sting, and we are inclined to feel that when the pioneers came, axe in hand, to establish lawns in the new country, that in the great arms of the old trees they found a source of protection and shelter that their later "betterments" have hardly compensated for. Yet very few saw it so. The leaves hid the sunshine, the roots were so many obstacles to the plow, and down they came. The bark went to the tanneries, a little of the timber was used, while the main part was burned in heaps and the ashes sold. Of course it was necessary to clear land, but the woodman, proud of his skill with the axe, saw only an enemy to agriculture in the forest, and nothing but complete extermination satisfied him, and with untiring energy the work was pushed, until from corner to corner of many a farm every branch was trimmed, no shade remaining for man or beast, no shelter for the friendly birds, nor cover for any covey of game. All clear, bleak, storm-swept and bald; with the springs dried up, the meadows brown and baked, the wheat smothered under drifts or frozen out on wind swept knolls. Many and many such a farm now lies bare and dreary under winter's cold and August heat, and the buildings stand on some hill side with no tree, shrub or friendly vine to clothe their nakedness. If a tree has been planted in a moment of inspiration aroused by some of the excellent rural papers, it has been used as a hitching post, a hen roost, or a scratching stick for lean-ribbed cattle, and brier-tangled horses, and it assumes a discouraged form, bent and hopeless, showing as little grace or adornment as does the farmer's wife, who is expected to get early breakfast, work all day, and do the mending in the evening while the lord of the *sile* takes a preliminary snore before the fire.

Heaven may temper the wind to the shorn lamb, but not to the shorn land.

The storm spirit revels over such a scene; it is just such a barren as with windfall and flame he makes in his wildest moods in the broad forest, and roaring and wailing at window and door, he tells of discomfort and disaster, until the farmer often comes out from a sleepless night to gather his scattered rails, nail up his broken fences, or long disabled gates and doors, and feed the unsheltered animals that waste their nourishment in resisting exposure.

Graceless indeed are such homes, and yet they are all about, lived in from youth to age by men who exult in claims to represent the civilization of the century, and they are satisfied with an outlook that would have driven away the very Indians whose rude tools are often turned up to provoke comment and contempt.

The glorious inheritance from the ages when beneficent nature was untrammled has been wasted, squandered, and only the years that lay generations low will undo the ignorant work, which is still going on, going on because coal is coming in as cheap as wood, and the farmer says there is no use in his acres of woodland.

No use in their beauty! Talk not of beauty to him who hates a tree for the land it covers; he would shave his eyebrows and apply guano if the space would produce at the rate of one ton of nice grass per acre, and let hens roost on his nose if they would lay hard *biled* eggs in his mouth! Talk not to him of the free gifts that cannot be replaced if once wasted. He will not learn the value of a tail even if he loses it, and until his sterile farm drives him west, out on some forsaken prairie, where trees three feet high cost fifty cents each from agents, with illustrations of how they will look to his children in thirty years; he will not see money or anything else in a tree.

Pass such a man's home in winter, button up your coat and drive fast, get home and take something to drive the chill from mind and marrow! Has the home of any bird or animal but man such a wealth of desolation? See the drifts that defy the shovel, and note the sod swept bare just by the corners. Hear the scream of the gale about the close cut eaves, and the rattle of the sash that clatter until it were better were they all filled with old hats that would keep quiet and veil the dreariness from the eye as well as ear. See the snow creep and crawl on the surface of the crust like a visible shiver, driven carelessly onward, and don't see anything more over your wrappings until you come to the home of one who loves a tree and cherishes it. Willingly will your steed halt and be patient in the lee of an evergreen grove. All about from the light undisturbed snow, resting like a beautiful cover over grain and grass, to the sleek animals that are ignorant of exposure, is suggesting repose and shelter. The wind whispers a more gentle tale in the pine tops, and when snow flakes fall they drop gracefully and coyly down, resting on branch and vine, till each seem again clothed in a new and more beautiful foilage. Winter and summer it is always a place to linger when the forest is near, and thrice fortunate is he who has some woodland between him and the cold north and west. In summer it is a cool and shady retreat, a place for quiet Sunday rambles, and one where he who runs may read lessons of deeper teaching than may be hammered into the pulpit of some unsheltered church.

From it children bring bright red willow wands and "pussies," the first harbingers of our tardy spring. From

it when the damp thawing air bears all sound with double richness, comes the warble of the blue bird and the whistle of the robin, and as the season advances, the partridge will drum to his mate, and myriad voices will cheer the busy workers on the farm.

Sheltered among ferns the spring will glisten all through the long summer, and about it an unpaid gardener will bring flowers of the rarest hue and perfume, and even in the short days when the trees snap with frost, the squirrels will come out and print their little tracks for the children's tracing, and the downy woodpecker, the Canada jay, and chickadee-de, will give life and animation. And such a place for trapping when there is little to keep the boys amused, is the farm wood lot; how many trips will be made to it at dawn to see what luck? When indeed on the homestead farm will more memories cluster to deepen the wish—"Would I were a boy again," than about the forest with the spring?

The farms are not all bleak and bare, although too many remain so. Many are in intelligent keeping, and not only is the woodland drawn from with care for the young growth, but groups of strong evergreens are planted to meet as outposts the most sweeping winds, and as they assume size a look of homelike comfort settles all about, and no one looks upon the coezy house free from a feeling that here the good offices of the forest are known and gladly welcomed.

The lessons are spreading, and speed the day when the exposed farm dwellings will shrink from our gaze into the shadow of protecting groves. To have these valuable trees cattle must be kept from them; some land must be given up; but the grove will give more warmth standing in the path of the gale, than it would burning in the stove; the blight of the May winds will pass over the sheltered land, and the beautiful home will rank in the market many dollars higher per acre than the bare farm that cannot spare any land for brush and timber.

No more important question lies before us than the preservation and extension of the woodland. It meets not only the mind of the farmer, but is forcing itself upon the manufacturer in the form of fearful floods and equally extreme droughts; upon the commercial men in dry canals and shrunken rivers; upon the railway king with regard to ties and fencing, and upon us all with extreme changes in climate that may render our fair State almost uninhabitable.

Legislatures, selfish as they are, must face the question, but in the mean time let us honor and encourage him who plants a shelter, and brings back a little of what has fled before ignorance and waste.

L. W. L.

—England imported last year the enormous amount of £14,603,479 of lumber. From Russia she received timber to the amount of £2,148,973, and from the United States, fully one-fourth of the whole amount, representing timber to the vast sum of £4,221,420. The timber used specially in England for mining purposes, is alone an extensive business; this wood comes principally from Sweden, Russia and France.

A DISEASE-DESTROYING TREE.—M. Gimbert, who has been long engaged in collecting evidence concerning the Australian tree *Eucalyptus globulus*, the growth of which is surprisingly rapid, attaining besides gigantic dimensions, has addressed an interesting communication to the Academy of Sciences. This plant, it now appears, possesses an extraordinary power of destroying miasmatic influence in fever-stricken districts. It has the singular property of absorbing ten times its weight of water from the soil, and of emitting antiseptic camphorous effluvia. When sown in marshy ground it will dry it up in a very short time. The English were the first to try it at the Cape, and within two or three years they completely changed the climatic condition of the unhealthy parts of the colony. A few years later its plantation was undertaken on a large scale in various parts of Algeria. At Pardock, twenty miles from Algeria, a farm situated on the banks of the Hamyze was noted for its extremely pestilential air. In the spring of 1867, about 13,000 of the eucalyptus were planted there. In July of the same year—the time when the fever season used to set in—not a single case occurred; yet the trees were not more than 9 ft. high. Since then a complete immunity from fever has been maintained. In the neighborhood of Constantine the farm of Ben Machydlin was equally in bad repute. It was covered with marshes both in winter and summer. In five years the whole ground was dried up by 14,000 of these trees, and farmers and children had excellent health. At the factory of the Gue de Constantine, in three years a plantation of eucalyptus has transformed twelve acres of marshy soil into a magnificent park, whence fever has completely disappeared. In the island of Cuba this and all other paludal diseases are fast disappearing from all the unhealthy districts where this tree has been introduced. A station house at one of the ends of a railway viaduct in the Department of the Var was so pestilential that the officials could not be kept there longer than a year. Forty of these trees were planted, and it is now as healthy as any other place on the line. We have no information as to whether this beneficent tree will grow in other than hot climates. We hope that experiments will be made to determine this point.—*Medical Times and Gazette*.

—The skin of an animal, whether cow, calf, colt or horse, that dies on the farm, is worth more at home than at the tanner's. Cut it into narrow strips, and shave off the hair with a sharp knife before the kitchen fire, or in your workshop on stormy days and evenings. You may make them soft by rubbing. A rawhide halter strap an inch wide will hold a horse better and last longer than an inch rope. It is stronger than hoopiron and more durable, and may be used to hoop dry casks and boxes, and for hinges. Try it on a broken thill, or any wood work that has been split. Put it on wet and nail fast. Thin skins make the best to use it in its natural state. For other purposes it may be dressed.

Natural History.

TRAPPING A CUNNING FOX.

WESTON, VA., December 13, 1878.

EDITOR FOREST AND STREAM:—

Some time last summer I saw a copy of your paper, and was greatly pleased with it, but being poor (an invalid soldier of the Mexican war) I was unable to subscribe for it. I am a trapper, and as the season is over, and I am shut up with snow here in the mountains, I thought I would try my "prentice hand" on a sketch for your paper.

Not many years since I was trapping foxes and other game in Londonderry, a town in the Green Mountain State, and the following account of my experience with a cunning fox may perhaps interest some of the readers of FOREST AND STREAM. My style of trapping foxes at that time was to set in water, preferring a warm open spring, placing the trap beneath the surface and near the shore. The best of springs will sometimes crust over near the shore in very cold weather, especially if there is no snow upon the ground. It was on such an occasion I one morning discovered that a large dog fox had got into one of my traps, and the ice prevented the jaws closing tight enough to hold him. I felt somewhat chagrined, as any sportsman will readily believe, and came to the conclusion that the old fellow would give me trouble; nor was I mistaken. He soon commenced springing that trap, apparently by reaching over and under and throwing it out upon the shore, and after a while would spring it by dropping pieces of wood upon the trencher, and before the season ended I found sticks standing upright between the jaws, showing plainly that he knew how it was himself. On every occasion he would regale himself with the bait, or at least drag it out upon the shore. His visits were not very frequent, so that I had opportunities for getting other foxes.

The next season reynard plagued me as usual, and still the third season found him alive, as mischievous and cunning as ever. Now, it must not be supposed that I was not alive to the necessities of the occasion, for in fact I exercised all my skill in trying to outwit him, and I enjoyed it, too. In truth, there is nothing a trapper likes so well as meeting with a cunning fox. There is an excitement about it that lends an additional charm to the sport, for you are compelled to draw on your every resource and originality, and when you have triumphed, as in the end you must, you feel a greater pride than in taking a dozen ordinarily.

But to my story. Whenever he visited my trap he invariably crossed my route, and as I well knew his track I could tell in advance when my trap was to be sprung. Of the many ways I adopted to catch him it were needless to state; suffice it to say that I used several traps at the same time, and he invariably sprung them all. But one day, as I stood gazing at his work, a plan occurred to my mind as if by inspiration. I set one trap, and at the next visit I had my game. When he saw me approaching he commenced to bark and jump furiously towards me. It seemed to me he felt enraged that I had outwitted him, and although I felt elated, still I could not but regret his fate, for he seemed so human in his intelligence. He had gnawed the trap till his jaw was worn through in front. That he was a patriarch among foxes was evident. Not a tooth had he left. His weight was fourteen pounds, and he measured four feet six inches from tip to tip.

C. L. WHITMAN.

—THE ROCKY MOUNTAIN HARE.—The Rocky Mountain hare is a rare species in Colorado. I saw but four during four months collecting in the Rocky Mountains. I do not know of any live specimens in a state of domestication. In the winter they descend the mountains and feed in the quaking aspen groves on the side hills in the valleys. During the summer months, they are found feeding on the outskirts of thick heavy timber, generally on the highest mountains. They breed in June, and do not burrow, and are very shy animals. Perhaps C. W. Derry, of Granite Lake county, Colorado, can trap one alive. They are known to him as the Mountain Jack Rabbit or Hare.

Yours, truly,
BATH, KING'S CO., N. Y. J. H. BATTY.

DO SNAKES HISS?

BALTIMORE, Dec. 17, 1878.

EDITOR FOREST AND STREAM:—

In reply to the question, "do snakes hiss?" I can assure your correspondent they do. In September, 1864, I twice heard it, and each time had my attention directed to the snake by the sound, and then saw and heard him repeat it. The snake was the *Heterodon Platirhinos*, *vulgo*, hog nosed snake, and in the country where I saw it, Baltimore Co., Md., viper. Dr. J. E. Halbrook, in his *Herptology*, 4th vol., sixty-ninth page, says of this species, that when irritated it coils itself as the rattlesnake does, erects its head, which it waves to and fro, and hisses. I think I have heard other species hiss, but cannot remember time and place.

Yours, truly, G. H. MORAN.

—Connected with the new citadel at Strasburg is a pigeon house, with accommodations of the most approved description for 500 carrier pigeons, to be ready in event of war. Are we in England, asks *Broad Arrow*, to rest so well satisfied with the omnipotence and omnipresence of telegraph wires as to neglect entirely the homing pigeon? In Germany, the War Department is wise enough to organize a pigeon loft in its important garrisons, but in England it is evidently to be left to private enterprise to encourage pigeon flying in Plymouth, Portsmouth, and Chatham. Some time since we endeavored to provide the means of

distribution of homing pigeons to the several garrisons, but our offer did not meet with adequate response; we therefore return to the subject, and shall be happy to offer prizes for pigeon flying in our great military garrisons, provided a committee of officers interested in the subject will aid us with their assistance or suggestions.

[It would be exceedingly interesting if some of our officers on the Pacific frontier should try and communicate with friends in the Atlantic coast by means of carrier pigeons. The extent of our country would allow of the homing instincts of these beautiful birds to be better tried than almost anywhere else.—Ed.]

The Kennel.

INSTINCT IN YOUNG POINTERS.

EDITOR FOREST AND STREAM:—

In the last number of FOREST AND STREAM is a remarkable instance of the above trait, taken from *Land and Water*. [See note below]. I can give you one from my own experience perhaps equally remarkable.

Twenty-five years ago, or more, then living in Chicago, I raised a brace of pointer puppies which, from the good qualities of their parents, promised well. They were trained to obedience, would fetch, and go to heel, but at six months old had never seen living game. When at that age I took them one day early in August in my buggy a few miles south of the city, where I expected to find a covey of grouse. It was then an open prairie, though now covered with streets and houses. While putting up my horse in the tavern shed, the dogs slipped away, and betook themselves to the prairie. I followed, but at first could see nothing of them. Looking carefully about, on nearer approach I saw their heads above the long grass a few hundred yards away, apparently standing on birds, but as they had never been in the field before, I could hardly think it possible. But sure enough, when I came up there was Don, pointing as steadily as an old dog, and Hal at a few paces behind backing him. Their point was as staunch as that of their sire (Phil), who would have stood on birds while his portrait was painted; nor did they move till I walked before them and put up a covey of half grown grouse. Then Don, who was high couraged and obstinate, started in pursuit, but dropped to the word "Down!" as did his more docile brother Hal. This was a remarkable manifestation of an instinct handed down through a long line of well-bred and well-trained ancestors. It could be nothing else, as these young dogs had never received any instruction or training, and had never seen or smelled living game before.

The next month I took out these dogs in company with their sire, and they seemed to hunt about as well as the old dog, who was one of the best in the State. Like him, they were liver colored, with a white spot on the chest, but their dispositions were wholly unlike. Don was high spirited and stubborn, requiring frequent correction, while Hal was timid, and needed encouragement. We hunted them that season, and they turned out to be the best brace of dogs I ever saw.

Next summer, the usual senseless panic about mad dogs taking place in the city, the police were ordered to strew poison about the streets, and both Don and Hal, escaping one night from their kennel, were poisoned. Had they lived they would, I think, have proved equal to their sire (Phil), who performed in his day all the remarkable feats recorded of pointers—such as pointing birds while bringing a dead one in his mouth, and coming to a point on the top of a fence, the scent having struck his nose as he mounted it. I have also seen him, when grouse were running before him and would not stop, deliberately back out from his point, and taking a circuit meet and bring them to a stand. He was also a good retriever, and though not fond of the water would plunge in and bring out game if there was no other way of getting it.

Being a great favorite with his master, he was allowed to live in the store, and so well did he understand the meaning of language that if his master asked him in the most common tone of voice, "Want to go hunting, Phil?" he would spring to his feet and rush about barking in great excitement till the wagon was brought to the door, when he would jump in and coil himself away under the seat. In his younger days no amount of work was too much for him in the field, and he preferred to go to it on foot, and would trot along the road under the horse's belly, where he knew he was safe from the attack of hostile dogs. He would fight savagely when he saw fit to do so, and often came home wounded, when he would go to his master whining to have his wounds dressed, clearly understanding the process, and never wincing at the pain of the operation. Being known as the best dog in the town, he was frequently stolen, but never remained long away, coming home travel soiled and weary, with a rope round his neck, which he had gnawed off and escaped. He was so fond of the sport that he would go out with almost any one who carried a gun, but if his temporary master proved to be a bad shot he would leave him with contempt. His qualities were inherited by his descendants, many of whom may be recognized in northern Illinois by their resemblance to him.

S. C. CLARKE.

NOTE.—The instance here referred to was first printed in FOREST AND STREAM, and thence transferred to the columns of *Land and Water*, which gave us credit. It was printed in a letter from our Jackson, Mississippi, correspondent. We thank Mr. Clarke for these additional very interesting incidents.—[Ed.]

—We notice in the *Field* that quite a number of fatal accidents have occurred in dogs from the use of santonine as a method for curing worms. Though we have ourselves

seen santonine given to dogs, and without ill effects, we have been chary of recommending it. The parallelism between human beings and dogs, as to their power of taking medicines, is not always the same, and santonine is not the only medicine which has this different power on animals. Recent cases are cited in the *Field* where a quantity of santonine, one to two grains, having been administered, resulted in the death of valuable puppies. We should therefore advise our readers not to use santonine for their dogs. In former numbers of the FOREST AND STREAM will be found several simple and harmless medicines. The best remedy, we think, is turpentine, strengthened with a drop or so of worm seed oil, mixed with castor oil. We have just had a puppy cured of worms, at least for the present, by using this method. It is quite probable that the pests will return again, when we will redose him. Some cases of the hurtful use of carbolic acid are also mentioned when used for mange. We believe when carbolic acid is employed with care, well diluted with water, made quite weak, and thoroughly mixed mechanically with the water, it can do no harm even to a puppy. After all, a good salve of lard and flour of sulphur almost always cures ordinary mange, though we have no objection to using carbolic acid in a weak solution well agitated. Will some of our numerous canophilic friends give us their experience?

CHAMPION POINTER DOG "BELLE."—The engraving of this remarkable dog, the champion of England for 1873, the winner of the great Bala Field trials, for all aged pointers and setters, beating Mr. Macdonald's Ranger, Mr. Llewellyn's Countess and Flax, Mr. Slatter's Rob Roy, &c., &c., with pedigree, and points made in the trial appended, sent by mail. Price, \$1. Discount to the trade. FOREST AND STREAM Publishing Co., 103 Fulton street, N. Y.

—A farmer at Augusta, Ga., lately discovered that his dog was in the habit of milking a fine cow.

The Magazines.

"ONE TOUCH OF NATURE."

A LARK'S song dropped from heaven,
A rose's breath at noon;
A still, sweet stream that flows and flows
Beneath a still, sweet moon:

A little way-side flower
Plucked from the grasses, thus—
A sound, a breath, a glance—and yet
What is it they bring to us?

For the world grows far too wise,
And wisdom is but grief;
Much thought makes but a weary way,
And question, unbelief.

Thank God for the bird's song,
And for the flower's breath!
Thank God for any voice to wake
The old sweet hymn of faith!

For a world grown all too wise,
(Or is it not wise enough?)
Thank God for anything that makes
The path less dark and rough!

INA D. COOLBRITH—Overland.

THE BERMUDAS.

THE soil of Bermuda is most fertile. It produces year after year, without the high manuring or long rests of other soils. The seaweed or kelp that everywhere floats into its bays and coves is the common fertilizer. It is the flotsam and jetsam of the waves, which all the planters have free access to, without tithe or toll. Two kinds of potato, the sweet and the white, and two crops of each can be grown each year. The delicate white potato that comes to us in the early spring from the Bermudas lacks the faculty which Mr. Toots valued so highly in his wife. It cannot repeat or reproduce itself. It is the poorest of propagators, and every year the common Mercers, or other potatoes of Ohio or Illinois, are sent to Bermuda to be planted, and in a few months come back to us the pink and thinskin delicacies so much affected by the New York palate. The growing of vegetables for the markets of the United States is fast becoming the chief business of Bermuda. A few of the onions from there find their way to the West Indies, and the bulk of the arrowroot goes to London. But with these exceptions, the garden produce comes this way, and in the spring, before our home markets send their supplies, the streets and wharves of the Bermuda towns are awakened from their usual dulness, and are crowded and bustling, and the supreme energy and effort of the year are displayed in packing, forwarding, and shipping their potatoes, onions, tomatoes, and other delicacies to New York and other ports on the Atlantic seaboard.

It must be understood that it is not always calm and smooth weather in Bermuda. The winds have the islands almost as much at their mercy as a ship at sea, and there are frequent breezes too strong for any but the best boats to venture out in, and occasional storms and hurricanes that carry havoc and destruction in their track. But the characteristic of the climate is its softness, and the nights as well as the days can, with few exceptions, be enjoyed "in the open" with safety and comfort.

The visitor to Bermuda who seeks the pleasures and excitements of cities will be disappointed. If he does not enjoy boating and fishing; if he tires soon of the same walks and rides; if he does not need the compensations of warmth and convalescence; if his nature be altogether busy and restive, and not given to meditative moods, then, probably his days will be tedious. There are no operas or theatres, none of the contrivances of larger cities for helping or improving time. The place is small, simple, and unpretentious; the people are kind, hospitable, and unaffected in their tastes and habits. Good and sufficient food can always be had, and clean and comfortable lodging, at prices that need not alarm people of moderate means.—*The Sanitarian*

MONKEYS ON THE GOLD COAST.

I HAVE as yet scarcely made mention of the numerous species of monkey and ape which are to be found on the Guinea coast. Truth to tell, I have an invincible repugnance to shooting these poor creatures. Their gestures are so human, and their distress and amazement when wounded so touching, that I can scarcely dissociate their destruction from murder. It is true that I have on one or two occasions shot them—once or twice because we were reduced to seek them as food, and their slaughter became a matter of absolute need. This happened up the Porto Novo Lagoon, near Lagos, where H. M. S. — had unfortunately grounded on a sand-bank, and the people of the neighboring villages, being both poor and unfriendly to us, could not or would not supply us with fresh provisions. I am not aware of the species of monkey we killed and ate; it was of about the size of the Diana monkey, and rather like it, although by no means so beautiful as that handsomest of the Simæ. They were generally to be found from dawn to seven o'clock a. m. up the palm trees (*Elias guineensis*), devouring the rich nuts; and they certainly appeared to thrive upon them, for no rabbit had ever tenderer or more succulent flesh than these little rascals. They were usually stewed or curried, and were excellent to those who could overcome their prejudice; and those whose stomachs were too squeamish were few in number, as a lengthened course of "salt horse," as Jack calls it, rarely fails to render any fresh meat a welcome addition to the table. The last monkey I shot was, I regret to say, for "sport;" and I vowed I never would shoot another wantonly. I was wandering about in a sort of little grove near Lagos, when in the tall trees above me I saw a large troop, headed by a very patriarch, with a long white beard and whiskers. I could not resist trying an "Eley" at him, and shot him through the body. As he fell at my feet I shall never forget the mingled expression of mild reproach and agony that he turned upon me, as he sat with one hand supporting his side over the wound. I confess to having felt a very Cain; and as, in mercy to the poor animal, I procured a heavy stake to knock him over the head and end his sufferings, my feelings were of a most painful nature—the more so as he was difficult to kill, being a powerful brute. No! I never will again kill a monkey for sport!

I except from this the tyrant of the Gaboon forests, the terrible gorilla, as it appears to be a task attended with considerable danger to hunt him out and attack him, and there seems to be more fair play in the matter. The huge and savage mandril, too, which is found in the countries bordering the Volta, and the gigantic ursine baboon, would doubtless be formidable enemies to tackle; and I have heard many tales of their ferocity from the natives, who appear to dread them. The latter animal, I have been informed, being solitary, is not uncommonly captured alive with the aid of dogs, who distract his attention from the hunters. I saw an immense female, I should say over four feet in height, in an iron-barred room at Cape Coast. They had attempted to secure her, having borrowed an iron chain from the prison, such as refractory prisoners wear for security; but she snapped it like a carrot.—*The Field*.

Answers To Correspondents.

[We shall endeavor in this department to impart and hope to receive such information as may be of service to amateur and professional sportsmen. We will cheerfully answer all reasonable questions that fall within the scope of this paper, designating localities for good hunting, fishing, and trapping, and giving advice and instructions as to outfit, implements, routes, distances, seasons, expenses, remedies, traits, species governing rules, etc. All branches of the sportsman's craft will receive attention. Anonymous Communications not Noticed.]

W. H. H., Hartford, Conn.—We can procure you the setter pup you want. Price \$25.

J. G. A., New York.—See instructions "Moccasins" in FOREST AND STREAM Nov. 20. Any good bootmaker.

Yolo, Philadelphia.—The whole question of using hair triggers was explained in an editorial of this paper, Nov. 12.

D. L. BODGE, Bald Mountain.—The address of F. Wesson's Breech-loading Rifle is "F. Wesson, Worcester, Mass." Peabody Rifle manufactured by the Providence Arm Co., Providence, R. I.

W. H., Boston, Mass.—What would you deliver in Boston a first-class setter dog for; a young, staunch, steady animal for ruffed grouse and woodcock shooting in New England cover? Ans. For \$80.

W. M. H., New York.—The astronomical telescope, with books on astronomy, you can procure by writing to E. H. Madison, 546 Fulton street, Brooklyn.

INDIA RUBBER, Germantown, Pa.—The decoys you speak of will not last any length of time. They require constant painting. See FOREST AND STREAM, Dec. 11, under "Shot Gun and Rifle."

R. S. N., Salem, Mass.—The weight of the Jack curlew is correct. His bill measured 11½ in., his legs 9½ in., and the body, with the head and legs cut off, weighed 2 lbs. 11 oz. I call it the great solitary Jack Curlew. C. B.

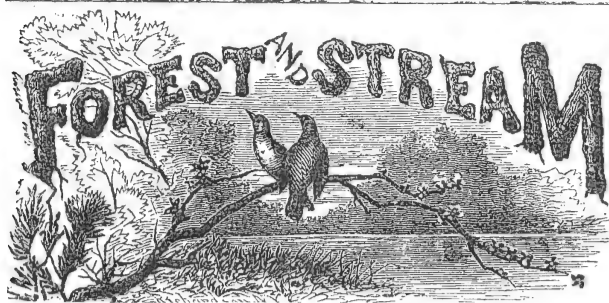

GREENY.—1st. Does a pin fire shoot as well as a central fire gun? Ans. No. 2d. What size bore is best for general use (excluding duck shooting)? Ans. No. 12. 3d. Does a muzzle loader shoot stronger than a breech-loader? Ans. No. 4th. Can metal shells be used in pin fire guns? Ans. Mechanically, yes; ordinarily, no.

J. S. K., Paterson, N. J.—Where can I go with a good chance of seeing and killing a bear? Ans. We don't know anything about the killing, but if you wish to see a bear, take H. R. R. for Kingston, which connects with the Rondout R. R. for Shokan, distance 17 miles; thence by private conveyance to Watson Hollow; ask to see C. Akert, the bear hunter, he will put you through, and most likely the bear also.

W. A. B., Harvard University.—In regard to the weight of lions and tigers when kept in menageries, we are of the opinion that they are mostly thinner than their brothers who range freely in the country. We are sure of having seen somewhere this fact stated, and that in a state of nature a tiger would weigh fully one-fourth heavier than when in captivity. Of course the nature of the *felidae* is changed in the narrow boxes we are forced to confine them in. The question of having open space for them was agitated in England, but was abandoned.

DE H. X., Hartford, Conn.—The method of capturing monkeys by making them drunk is frequently cited. In Mansfield Parkyn's travels in Abyssinia it is stated that the plan adopted by the Arabs of Taka, is to take large jars of the common country beer, sweetened with dates, drugged with the juice of the oscher (*aselepias arborea*), and to leave them in the neighborhood of where the monkeys come to drink. The monkeys drink largely and soon fall asleep, and are taken senseless by the Arabs. We may state, however, that Parkyn's book, to us, has always partaken of the mythical character. Facts of this character, though very probable, are not positively reliable.

NEWCOMB.—We are glad you are so guileless as not to know what a "set line" is. It is a poacher's contrivance, but is most useful to the sportsman at times, when fish can be caught in no other way. It is merely a stout cod line from 100 to 1,000 feet in length, to which short lines are attached at intervals of twenty feet or so, baited, and made to reach within three or four feet of the bottom. It is stretched across the entrance to coves and bights to which fish resort. It is supported by buoys. When a sufficient time has elapsed for the desired fish to hook themselves, it is overrun and the catch taken off, the hooks rebaited, and the whole set again. Live minnows are the best bait.

A WEEKLY JOURNAL,
DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY,
FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS,
AND THE INSTRUCTION IN MEN AND WOMEN OF A HEALTHY INTEREST
IN OUT-DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Company,

AT

103 FULTON STREET, NEW YORK.

Terms, Five Dollars a Year, Strictly in Advance.

A discount of twenty per cent. for five copies and upwards. Any person sending us one subscription and Five Dollars will receive a copy of Hallock's "FISHING TOURIST," postage free.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices, 50 cents per line. Advertisements in double column 25 per cent. extra. Where advertisements are inserted over 1 month, a discount of 10 per cent. will be made; over three months, 20 per cent; over six months, 30 per cent.

NEW YORK, THURSDAY, DEC. 24, 1873.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal letters only, to the Manager.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited.

We cannot promise to return rejected manuscripts.

Ladies are especially invited to use our columns, which will be prepared with careful reference to their perusal and instruction.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

CHARLES HALLOCK,

Managing Editor.

MERRY CHRISTMAS!

HO! a Christmas greeting to the patrons of FOREST AND STREAM! What though the woods are bare and cheerless, the water-courses bound by fetters of ice, and the whole earth covered with snow? A cheery greeting, for all that, to those who burn the Yule log and brighten their homes with the holly and yew. They say these days are the embers of the dying year; then kindle the flames of life and love anew. Light up the candles that gleam in the branches of evergreen. Hang Christmas boxes on every bough. Make every one happy, old and young. Rejoice! for to-day THE CHILD is born that promises the redemption of the world!

What joyous festivities ever attend the recurrence of this hallowed natal day! By merrie old England, with its roast beef and plum-pudding, its hunters and hounds, and its pealing chimes from solemn Westminster; by the potifical hosts who crowd the aisles of St. Peter's at Rome; by the Muscovites who raise the emblem of the cross on every street and highway; by the straight-laced Puritans of New England, with their tables that groan with turkeys, pumpkin pies, and cranberry sauce; by the cavaliers of old Virginia, who celebrate with tournament, fox-chase, and turkey shooting; by the exuberant negroes of the far South, to whom these holidays were always an especial season; by all throughout the length and breadth of the civilized globe where Christianity is recognized, this sublime Holiday is welcomed with a zest and manifestations that greet no other. Chief among its customs and observances is the interchange of presents. It is a most befitting custom, and conducive of good-will and enduring friendship. But this year, it is said, old Santa Claus is poor. His usually plethoric stocking is out at the heel. He drives but a sorry team, and his chuckle is less merry than usual, when he is wont to cram the bags of the youngsters that hang in the chimneys. But what does this signify? We will give the old fellow credit for past favors and best intentions, and still be jolly. Our resources for pleasure are boundless and varied, and none of them all are more enjoyed than those which the open air affords—the jingle of the bells over the crisp and creaking snow, the ring of the gleaming skate on the polished ice, the wild hunt in the forest, the dash after Reynard, and the numberless pastimes in vogue from north to south. And so, to all rosy-cheeked lasses impatiently waiting for Christmas boxes, to all lovers of roast beef and plum pudding, to sweethearts and swains neath the mistletoe, to the piously devout who observe the day as sacred to all its hallowed recollections, to the jolly roysterers who fill their bumpers to old Kriss Kringle, to the butchers, the bakers, the lamplighters, the

news carriers, the bell-ringers, the pastry cooks, the confectioners, the car-men, the rag-men, the beggars, the dominies, the everybody who is expecting a good dinner and kindly remembrances on this welcome anniversary, we wish a right jolly, thumping MERRY CHRISTMAS. Hurrah for Santa Claus, Saint Nicholas, Kriss Kringle, and all the rest of the mystic crew—for "Christmas comes but once a year!"

ENGLAND VS. AMERICA.

CHALLENGE TO OWNERS OF POINTERS AND SETTERS.

THE publication in the columns of the FOREST AND STREAM of the challenge thrown out to all American sportsmen by Mr. Price, of Bala, Wales, who is desirous of testing the comparative merits of English and American pointers and setters, has excited considerable attention, having been copied by all the leading journals in the United States.

The straightforward tone of the challenge and its liberality, are characteristic of the gentlemen sportsmen of England. As was stated in our last issue, it is all very well to expatiate on color, form, appearance and fineness of breeding, but the real crucial test, the positive action, hearing and manner of the dog in the field, when in presence of the game, is the only thing worth caring for. Dog shows are of course admirable in their way, as far as the judgment of experts can go as determining those ideal proportions which should always accompany certain marked breed of dogs. But from some quite extensive experience in dog shows, and bowing to the opinions of the best judges, it has often come to our notice that the handsomest dogs were not the best. The field trials at Bala, North Wales, have inaugurated a most novel, interesting method of testing the actual hunting qualities of the pointer and setter, and the only one which is practical. At Bala, the intuitive instinct of the dog is tested, and to it is added the education, the training he has received from man, his master.

Mr. Price, in offering this friendly match, proposes to adhere to the rules which governed the Bala contest, and offers as arbitrators of the trial such distinguished names as Sir Watkin William Wynn, Bart., and Viscount Combermere. A certain fixed standard of excellence of performance is decided on. The nose, as allowing fine shading of scent, is placed at 30. Pace and style of hunting at 20; breaking at 20; pointing (style and steadiness) at 15; backing, 10; drawing on game or roading, (not attended to as much as it should be by our sportsmen with their dogs in the United States,) at 15. It will be seen by the performance of Belle that with a possible 100 points, she was within 2½ points of being perfection, her total excellence being 97½.

We have already received numerous letters asking for information as to the rules and regulations which govern field trials, which rules, &c., we will shortly publish.

In order to give our own sportsmen who own pointers and setters some insight as regards field trials, we publish an account from the London Field of the trial of Belle, the winner: "Belle and Grouse" were expected to do a great thing, but their attention was first riveted to some snipe on boggy wet ground. The bitch made a false point or two, which the judges did not lay much stress on, as birds had probably been there, and she cleverly puzzled out the scent, and waded up to a brace of close-lying young grouse in high heather. The dog was never in it, and let the other do all the work. He possesses some style in pointing, but is slow and clumsy in ranging, wanting more go and finish. As to the bitch, she is almost our *beau idéal* of a broken pointer—a pleasure to shoot over and a treat to see, making sport delightful, and walking up birds murder. "Belle" dropped to shot when a drawn bird was knocked down, and then got two consecutive points. They didn't put any birds up, though it was thought probable that they would. For one hour and a quarter chance held the scales, and it required great discrimination and knowledge of sport to pick the winner, which knowledge the judges fortunately possessed. The flag was run up in honor of "Belle," and to avoid disputes, and to settle bets, Countess and Rob Roy fought it out for the third place, and the bitch having improved a little, won it.

THE MIGRATION OF BIRDS AND THE TELEGRAPH.

IN *La Chasse Illustrée*, we find not only a most ingenious but interesting article on the subject of the migration of birds, where the idea is developed of bringing into use the telegraph, in order that we may better study their movements. With the prime instinct of the birds to move their quarters from North to South, and vice versa, we have nothing to do, but it may not be impossible to study the direction of their flight, and give the reasons for their alighting on certain favored localities and not on others.

Two causes very probably induce migrating birds to settle. First, the necessity of food, in order to replace forces exhausted by a long travel, or to gain strength for renewed flight. This would induce birds to stop on their journey at points where food was most abundant, and the best adapted to their tastes. Secondly, birds of passage fly with the wind, that is when they can; but when the wind is adverse, they sometimes, but not always, alight. In fact, the advent of birds, even their residence in certain quarters, and the duration if they stay, seems to depend very frequently on meteorological causes. Now, all that is wanted, as proposed by our French contemporary, is to have some central office, and by means of telegraphic communications to study the movements of the birds and the

conditions of the atmosphere. For instance, the wind off the coast of British America, on the 10th of September, might be blowing from South to North, the probability then would be that the ducks, geese and wild fowl would be slow in coming to our shores. Now, if on the contrary, the winds on the whole coast had been blowing from North to South, the advent of ducks, brant and geese might be earlier than usual.

The migrations of inland birds might also be studied in this way, not only to the profit of the sportsman but of the naturalist. Questions in regard to the capricious movements of that most uncertain bird, the woodcock, taking into account both its opportunity of procuring food in certain localities, and the effects of wind and temperature, might help us better to understand their coming and going.

In an early number of the FOREST AND STREAM we wrote in regard to the influences of temperature on fish, as directing their movements, and that fishermen studied the meteorological reports with advantage. The benefits we already derive from Maury's system of weather reports may still have further development, and it is not at all impossible that the ideas of our French contemporary may be quite practical. As was remarked before by us, the advantages to be derived from the solution of any scientific fact are immense, and practical benefits derived from it extend in directions which were at first unthought of.

THE FORESTS AND THEIR EFFECTS ON MAN.

THAT the effects of moisture have a marked influence on the physical condition of man, is we believe pretty clearly established. If we contrast the stature of the Englishman living in a country surcharged with moisture, with the Arab living in the arid plain where rain but rarely falls, we have the two extremes of man, considered in an animal sense. Questions of moral or mental power, do not enter into this question, though that some effects, of an incorporeal nature, are closely allied to a corporeal condition, seems quite evident. If some of the careful observers, of the meteorological conditions of the United States in reference to the physical condition of its inhabitants have already advanced the somewhat bold idea that the drying up of the face of the country caused by the destruction of the forests has already had an effect upon the health and longevity of the people, and that there is a tendency towards increasing degeneracy, we are not prepared exactly to agree with them. The anthropological studies of the American race have not yet commenced. There can be no comparison made yet of our own people, for the reason that we are too young, and that we have no standard of our own to go by. The inhabitants of the United States are composed of such mixed elements that for centuries to come there can be no types. We differ, too, in another important respect, from all other nations. If it was possible to imagine a peculiar race of beings, as for instance the Basque people, who having a certain definite physical form and language, men and women who have preserved their type by isolation for 1000 years, such an accident is utterly impossible in the United States, where men wander to and fro every day, and where that novel factor, locomotion, or the ease with which a man can move, has undoubtedly everything to do in preventing the creation of any fixed rules of size or corporeal proportion. Yet the effects of the ruthless destruction of the forest, and the consequent depriving of the soil of the requisite degree of moisture, may certainly have even at the present, minor local effects. The quality of food a man eats may have more to do than we think for with his physical and mental qualities. The humidity of the atmosphere, as was remarked by Dr. T. C. Duncan, of Chicago, has a marked influence upon the vigor and fruitfulness of both animals and plants, and therefore the effects of this great and growing change on the face of the country, and its climatic and meteorological condition upon our people, is worthy of the attention and study of men of science.

If the effects of this denudation of the soil, this absolute stripping the ground of all its natural covering, by cutting away ruthlessly, inconsiderately, all the forests, does not today make itself felt but in a minor degree, it has within itself a latent and accumulative power for working ill, not only to man, but to his works, which may be developed in a few years hence. The absence of rain fall in any section of country, is sufficient to deter civilization. Whole broad areas of this good country of ours, will very probably be in the condition of barren wastes some years hence, regions which years ago, when they were covered with the forests, rejoiced in the falling showers. "The Government, land owners, private individuals, should encourage the growth of timber in barren regions," writes Dr. Duncan, and prevent the clearing off of whole belts of timber where the face of the country would be materially affected thereby.

THE FOREST AND STREAM SPORTSMEN'S CLUB.—We fully appreciate the high compliment paid to the FOREST AND STREAM, by the fact that a club has been formed with the title of the "Forest and Stream Sportsmen's Club," at Brainerd, Crow Wing Co., Minnesota. As we have the pleasure of a personal acquaintance with several members of the club, and know them to be thorough sportsmen, we feel certain that the name these gentlemen have given to their club will be upheld with all honor. We trust to hear frequently from the club, and it will give us pleasure to record their prowess.

—Lake Erie is the home of thirty-five varieties of fish.

MACKINAC ISLAND AS A PARK.

WE most especially recommend to the notice of Congress the measure introduced at the last session by Senator Ferry at Michigan, as to the expediency of dedicating to the public use as a park the Island of Mackinac, now held by the United States as a military reservation. This most beautiful Island, situated on Lake Huron, just at the entrance of the Straits, which connect the two grand Lakes of Huron and Michigan, is some 320 miles from Detroit, and lies almost directly in the way of the tourists and travelers who take the great fresh water road to Lake Superior. The Island of Mackinac is celebrated for the magnificence of its scenery. Covered mostly with a grand old forest, which has so far escaped pretty much the ruthless axeman, it lies placidly on the deep blue waters of the lake. It has certain peculiarities which would make the preservation of the Island for public use a most fitting one. From its geological formation, and from its configuration, sloping to the water in some places, and with high bluffs in other parts, it has a remarkable water drainage. When you go to Mackinac, no matter how hard it may rain, in two or three hours afterwards, as if by magic, the ground is dry. Mackinac would then, of all places, from its salubrious climate, be an Elysium for those afflicted with pulmonary diseases. As a place of public resort from its situation, within easy reach of Chicago, Detroit and St. Louis, and other great north-western centres, the preservation of this Island would be hailed with untold satisfaction.

Measures of this character are as wise as they are thoughtful. The worthy Senator from Michigan is not thinking only of to-day but of to-morrow, not of us alone belonging to the last quarter of the 19th century, but for those who will come a hundred years after us. Surely if our cities make appropriations for breathing places in their midst, why should not the government imitate their example on a grander scale? There is land enough for us all, and since the Yellow Stone Park has been appropriated to public use for the inhabitants of the Pacific slope, why should we not have a grand Park for the North.

In this particular instance, the Island of Mackinac belonging to the United States, and necessitating no outlay on the part of the government a concession of the character as proposed by Mr. Ferry, could not meet with any possible objections. If from the position of Mackinac it might be of use at some future day as a strategic point, there is no reason why it could not be made to serve for this purpose, for such is nature's cunning, and so charmingly does she deck herself with her native braverie, that festoons of creepers and fern might cover battlements and gun embrasures, and none be the wiser nor the Island the less beautiful.

The FOREST AND STREAM most strongly advocates the founding of National Parks and thinks the people cannot have too many of them.

SLEEP AS A MEDICINE.—A physician says the cry for rest has always been louder than the cry for food. Not that it is more important, but it is often harder to obtain. The best rest comes from sound sleep. Of two men or women, otherwise equal, the one who sleeps the best will be the most moral, healthy, and efficient. Sleep will do much to cure irritability of temper, peevishness, and uneasiness. It will restore to vigor an overworked brain. It will build up and make strong a weak body. It will cure a headache. It will cure a broken spirit. It will cure sorrow. Indeed, we might make a long list of nervous and other maladies that sleep will cure. The cure of sleeplessness requires a clean, good bed, sufficient exercise to produce weariness, pleasant occupation, good air, and not too warm a room; a clear conscience, and avoidance of stimulants and narcotics. For those who are overworked, haggard, nervous, who pass sleepless nights, we commend the adoption of such habits as shall secure sleep; otherwise, life will be short, and what there is of it sadly imperfect.

The *Tribune* has a graceful column devoted to some new incidents in the life of the great naturalist, Agassiz, evidently written by one who knew him well. We give one of them:

"One day from my window I noticed a horse that had been carelessly hitched, had worked himself loose, and, having moved a little way out in the street, seemed inclined to go off with an empty wagon. A student and a minister of the gospel in turn passed that way, but neither made any effort to keep this horse from straying. Presently I saw Agassiz coming down the avenue, apparently absorbed in deep thought, his eyes bent upon the ground. He stopped when he got to the horse, and, without seeming to take his thought off the subject on which he was engaged, picked up the hitching-strap, tied the horse, and went on, leaving the owner ignorant that anybody had done him a favor."

ALL ABOUT A FRENCH HORN.—It is no easy task to wind the French Horn—or even a cornet-a-piston—not mentioning the trombone or the euphonyde, without throwing a certain amount of moisture into the *embouchure*—or mouth-piece. How strange that not exactly a name—for the St. Simons has always been illustrious in French annals—but that the fortunate career of this noble family may be said to have arisen from the neatness with which one of its members could blow the calls for the hunt on the *cor de chasse*. It is told that Louis XIII, when hunting, would only take St. Simon's horn to blow through, because St. Simon's breath was sweet, and for the reason, besides, that there never was any saliva in the mouth-piece.

THE COMING MAN.

WE have had occasion from time to time in discussing the many topics which come within the scope of our Journal to treat of that most important one, the future physical and mental condition of the American people. This subject was forcibly presented to our minds when reading Lieutenant Butler's book, "*The Great Lone Land*." Speaking of the tired, travel-stained crowd of men and women seeking their western homes in this land of ours, some fair-haired with the pure Scandinavian type, others with the dark lustrous locks of the South of Europe, this great mixture of Celt and Saxon, Teuton and Dane, of Fin and Goth, of old Roman and Greek, the author wonders how this huge machine of American civilization will grind up this heterogeneous mass, and what will be the character of the future compound. Certainly the world never has witnessed such a gigantic fusion. We may philosophise as we please, but men and races have their marked different characteristics—some of them, too, right sharply defined. The gold, the brass, the silver, the lead, the dross, have all their living prototypes, and when they are thrown together, in this seething furnace of ours, one cannot help but speculate as to what shall be the final ring of the metal that comes from it all.

Are the worst characteristics, the idiosyncracies of each nationality, to be tempered or bettered? Are we to have nobler, stronger and higher instincts engendered? Are certain human families, like particular plants, which indigenous to some soil, take stronger root when transplanted, and throw out more vigorous branches, laden in their time of fruitage with richer, riper fruits? Will the German, the Swiss, develop for his foster mother, stronger bonds of attachment, than those which once held him to his Rhine or Alp? Are we to have worked out in the United States the wonderful problem of regeneration of the human race? There is a dull heavy morbid philosophy, and a narrow-sighted one which dreads change, that fears the coming of this future race; that trembles at the old natural decomposition, which must inevitably occur before the newer elements can arise! Let us hope that this transition may be a gradual one, and without shock or clash.

What then we may expect from this newer type of man, no man can tell. It seemed, ten years ago, that the Celtic forms might physically shape our future race; but to-day, the Teuton element, if our statistics are to be trusted, seems to be getting the predominance. European political changes will have the most momentous effects on our future generations. There is not a petty difference abroad, from the raising of a groshen, a centime or a halfpenny on the pound of bread, not a contest from a miserable barricade of a few factious blouses in Paris, to the dire shock of armed forces, hurled by the hundreds of thousands against each other in Europe, which does not effect us instantly. As this year of our Lord, 1873, passes away and is numbered among the things that have been, we await the coming years with hope. We are all in God's hands. Misery may be meted to some, happiness to others. All nations are as individuals, and the Almighty holds in his hands their destinies.

In this great land of ours, with its limitless extent of country, there is room for all comers. They will shape themselves by some natural process, so simple, that though it be a mystery to us now how it can be done, our children wiser than ourselves will see in it only the most natural of sequences. We pray though most especially at this season, remembering the holy coming of our Lord. "Peace and happiness to all men."

—Sir Samuel and Lady Baker were the centres of attraction at the late meeting of the Royal Geographical Society, held in London on the 9th of this month. Sir Samuel Baker, after having been welcomed by Sir Bartle Frere, gave a *viva voce* narrative of his famous exhibition. He briefly sketched his exploration into Central Africa, and the many difficulties encountered, and though but dwelling lightly on his own personal prowess, all who heard him were convinced that the success of the undertaking was mainly due to his own pluck, courage and indomitable energy. So thought, undoubtedly, the Prince of Wales, who concluded the ovation to Sir Samuel Baker and his Lady with quite an able speech.

—All our new subscribers express their pleasure at the excellence of the articles they have received as prizes by accepting our most liberal terms. See advertisement. Skates, guns, rifles, fishing rods, prints, books, &c., given to all new subscribers to the FOREST AND STREAM.

—"The gun you sent me is just what I want, handy and serviceable. It did not give me much trouble to get up the club for the FOREST AND STREAM," writes one of our young subscribers. See our Prize List.

DEPARTMENT OF PUBLIC PARKS, OFFICE OF MENAGERIE, New York, Dec. 20, 1873.

EDITOR FOREST AND STREAM:—

List of animals donated to Central Park Menagerie for week ending Dec. 19, 1873:—

One Apella Monkey, *Cebus apella*, Hab. Brazil, presented by Mrs. Fred. Lewis, N. Y. city; two Canada Porcupines, *Erethizon dorsatus*, captured at last end of Hoosac Tunnel. Presented by Mr. J. H. Blood. W. A. CONKLIN, Director.

QUESTION FOR CHRISTMAS COOKS.—What is the difference between dressing and stuffing? The first comes before church, and the last after church, at dinner.

CREEDMOOR.

THE SCORES AT CREEDMOOR FOR THE SEASON OF 1873.

We resume in this issue the scores at Creedmoor. For commencement of same see FOREST AND STREAM, No. 18 of December 11. In our last in giving the score of the Amateur Rifle Club, we were unable to obtain the names of the rifles used by the contestants for the badge; we now furnish this necessary data.

ABBREVIATIONS FOR NAMES OF RIFLE.

R. M.—Remington Military. Spg.—Springfield.
R. S.—Remington Sporting. Ber.—Berdan.
Shr.—Sharpe. Bal.—Ballard.
W. B.—Ward Burton. Win.—Winchester.
May.—Maynard. M. l.—Muzzle Loader.

NAME.	Age.	No. of shots.	Average.	Rifle.
J. P. M. Richards.....	106	28	3.57	Sharpe.
Robert Omand.....	25	28	3.57	
John Bodine.....	97	28	3.46	M. & Rem. Sportg.
George W. Wingate.....	72	21	3.42	Rem. Sporting.

—The Sultan is about to send to the Emperor of Russia a present of several fine Arab horses of the present breed.

—"I am perfectly satisfied with the rod you sent me. It is much more elegant than I expected. I shall put it aside for the coming season. I am working for a shot gun now, and will have it before two weeks are over," writes a gentleman in New Jersey. See our Prize List.

Sporting News from Abroad.

QUESTIONS of human longevity are always most interesting, and public curiosity in regard to this subject is rarely stated. If those who make a study of vital statistics, carefully catalogue all professions in the interest of science and of life assurances, determining that needle sharpeners and white-lead manufacturers live the shortest periods, while agriculturalists have the longer leases on life, we should hardly think that they, the statistical people, would readily declare that a horse-breaker's life offered any very fair chances of a long existence. It is, then worth while to record the extreme duration of life vouchsafed to one Daniel Callaghan, familiarly known as "Old Dan," now residing at Clonmult, County Cork, Ireland, who first drew the breath of life, (if the chronicler is to be believed), in the year of our Lord 1763 at Ballyclough. The London *Field*, who mentions the fact, says he entered life as a kennel boy to Lord Lisle at fourteen, and then rode steeplechases for some time afterwards. One wonders how the boy could have even arrived at manhood's years, as rider of an Irish steeplechase, according to the break-neck practices of the Irish turf, eighty-five years ago. But Dan stood it all and was then huntsman for no less than seventy-two years, serving under various masters, being a daring and reckless rider, until tired of this somewhat tame profession, there being not risk enough about it, in his eighty-fifth year, he took up horse-breaking as a recreation in his older days, keeping at the work until he was ninety-nine. Think of a man alive to-day who can tell about the Irish Rebellion and the battle of Vinegar Hill, and who has ridden to hounds eighty years, and trained horses when he was one hundred, and who can to-day, when he is one hundred and eleven years old, walk erect, and give information on matters that passed a century ago. Broken bones, he must have had, and many of them, but he laughed at such slight mishaps. Such a brave old man, and tough withal, should not want, and a newer generation should care for him. Will any one on this side of the Atlantic lend a helping hand to this grand old huntsman, who rode to horse and hound in Ireland long years before, perhaps, any one of our readers in this new country was born?

—Gallant Rob Roy! How we have all followed you, Mr. Macgregor, and your brave little canoe, as she threaded placid rivers or thrashed in the surging seas. We have to thank you for having almost created a most delightful and health-giving recreation. It behooved a good Anglo-Saxon to take the canoe from the Indian, and to teach us all that it was not the Chippewa or the Ojibbeway plying the paddle on the Saskatchewan or the Winnipeg, or shooting the rapids of the Chute à Jacquot or Slave Falls, who could alone manage the daintiest of water crafts. And now you have been married, and the Royal Canoe Club, of which you are the worthy Captain, have in recognition of your services presented you with a silver claret jug and goblets, executed in Flemish style and parcel, gilt, with the following inscription engraved thereon: "Presented to John Macgregor, Esq., Captain of the Royal Canoe Club, on the occasion of his marriage, by his friends in the Club, as a mark of esteem, and in recognition of his efforts to improve canoes, promote canoeing and unite canoeists, Dec., 1873." Our own American Clubs send you kind greeting, Mr. Macgregor, and would like to have filled your famous silver jug with the rarest claret, and do wish you and yours all health and happiness; and may the time come when other Macgregors will paddle, too, their own canoes and write as pleasantly as did their sire.

—There is one peculiar style of athletic amusement unknown in the United States such as has just been largely attended in London. With us, hand to hand contests with sword and sabre, are almost unknown. We have, too, unfortunately but little knowledge of that queen of all weapons the foil; even perhaps in old England the *fleur-de-lance* is rather an exotic. What we principally refer to are those peculiar English feats just accomplished before the London Athletic Club with swords, such as Professor Waites' feat, (we thought we had the monopoly of the Professor in the United States), of cutting a sheep in twain with a vigorous sword cut, and slicing an apple quite as nicely as would a Yankee apple pairing machine, only that the forbidden fruit in this instance is held gingerly in a friend's hands, the Professor ending by forging through bars of lead with his blade as if they were boiled carrots, repeating old Richard Cœur de Leons' performances. They had, too, at this same Assault of Arms, the quarter-staff, when a Mr. Rogers and a Mr. Bently cracked each other's sconces merrily, and both heroes smiled as showers of blows like Nasmyth's hammers—heavy enough to fell an ox—rattled on their devoted heads.

—The bicycle has a solid footing in England, though an almost forgotten toy with us. The latest match was one between John Keen, the champion bicycle rider, and Polly, a pony, for a race of twenty miles. The velocipede beat the quadruped, Polly being so badly distanced at the sixteenth mile as to give it up. 3 min. 25 sec. was about the time of the best mile.

—The last stag pursued by Her Majesty's stag hounds was caught in the midst of clothes-lines, where a family wash was going on. Sound trumpets, yelp dogs, shout huntsmen, and clap your hands, ladies and gentlemen, who were present at the finale, and may some poet sing of the noble stag who came to his death in a laundry, mayhap drowned in the dirty suds.

—If they are horse-eaters in Paris, through choice, not necessity, they probably have acquired a taste for strange game. We see in *La Chasse Illustrée* that they have a new

kind of bird for sale in the markets, namely, pelicans, which were killed at Crau d'Arles, and that two pelicans brought 110 francs. Let some of our Florida friends prepare instantly a consignment of pelicans to Chevet, the famous Parisian purveyor of good things. Patté de Pelican may be good, but like the man who eat crow, we do not hanker after it.

The Horse and the Course.

—The Louisiana Jockey Club held the third day of the annual fall meeting on December 18th. The attendance was large and the track in excellent condition. First race—Handicap; two-mile dash. Six horses started, and the race was won by Fred. Bonnabel, beating Port Leonard, Meta H., Donnybrook, Mary L., and Vidal, in the same order. Time—3:43. Second race—three miles; all ages; club purse, \$800. Six horses started and the race was won by Cape Race, beating Fannie M., Tom Arken, Fred. Bonnabel, Wanderer, and Carrington, in the same order. Time—5:34. Third race—selling race; all ages; mile heats; purse \$500. Edwin Adams won in two straight heats with great ease. Time—1:47.

—The Louisiana Jockey Club held the last day of the fall meeting on December 20th. The weather was clear and cold, the track good, and the attendance fair. First race—Hopfin Stakes for two-year olds; one mile; \$25 entrance; \$700 added. Ten horses started, and the race was won by Ballankee, who took the lead at the start, and kept it throughout. Bay Run was the favorite. Time—1:46. Second race—Consolation Purse; \$400; one mile; Falmouth took the lead and kept it, winning by two lengths. Western Star second, and I. O. U. third. Western Star was the favorite. Time—1:44. Third race—four-mile heats; Club Purse, \$1,200. Silent Friend won in two straight heats.

SHEPHERD PONIES.—Mr. J. G. Casey, of Suisine City, California, has but recently imported a fine head of thirty-one Shetland ponies. He intends to stock a breeding establishment in California. These diminutive animals may possibly come into practical use. They are docile, cunning, and willing. In their native home they are employed in many useful ways. The experiment we trust will prove a success.

THE PERSIAN CHASE.—A correspondent of the London *Field* writes as follows:—Having lately come across an excellent engraving of a Persian greyhound bred in England, I venture to forward an interesting account which accompanied the engraving, which appeared in one of the old sporting magazines, of the manner in which this animal is employed and the esteem in which he is held by Persian sportsmen. Most of the Persians nobles are exceedingly fond of the chase, and keep a number of these animals at a considerable expense, and the best and most favored of these dogs have collars and housings covered with precious stones and embroidery. These greyhounds are employed in coursing hares in the plains, and chasing the antelope. As the speed of the latter is greater than that of the greyhound, the Persians train hawks for the assistance of the dogs in this kind of chase. The hawks, when young, are fed upon the head of a stuffed antelope, and thus taught to fly at that part of the animal. When the antelope is discovered the hawk is cast off, which, fastening its talons in the animal's head impedes its progress, and thus enables the greyhounds to overtake it. The chase, however, in which the Persians chiefly delight, and for which these greyhounds are most highly valued, is that of the "ghookhur," or wild ass. This animal, which generally frequents the mountainous districts, is extremely shy, and of great endurance, and is considered by the Persians as one of the swiftest of all quadrupeds. These qualities, and the nature of the ground over which it is usually chased, render the capture of the wild ass very uncertain, and its pursuit extremely hazardous to the sportsman. When the Persians go out to hunt the wild ass, relays of greyhounds are placed at various distances in the surrounding country, in such directions as are likely to be traversed by the object of pursuit, so that when one relay is tired there is another ready to continue the chase; such, however, is the speed and endurance of the ghookhur, that it is seldom run down by the greyhounds, its death being generally achieved by the rifle of some lucky horseman. The Persians evince great skill and courage in this arduous sport, riding up and down precipitous hills, over stony paths, and across ravines and mountain streams which might well daunt our boldest turf skimming Meltonians. The Persians and their neighbors, the Arabs, are pretty well known to be excellent horsemen, and we are certainly indebted to the breed of horses they ride for certain improvements in our own; but I do not think our own breed of greyhounds would derive any benefit by an introduction of the Persian blood, as, although somewhat symmetrical in form, they appear to be too loose in structure for English coursing. Several specimens have been imported into this country, and one was exhibited at the last Crystal Palace Show, but I do not think the breed will be thoroughly established here.

THE FOOT OF A HORSE.—The human hand has often been taken to illustrate Divine wisdom—and very well. But have you ever examined your horse's hoof? It is hardly less curious in its way. Its parts are somewhat more complicated, yet their design is simple and obvious. The hoof is not, as it appears to the careless eye, a mere lump of insensible bone, fastened to the leg by a joint. It is made up of a series of thin layers, or leaves of horn, about 500 in number, and nicely fitted to each other, and forming a lining to the foot itself. Then there are as many more layers, belonging to what is called the "coffin bone," and fitted into this. These are elastic. Take a quire of paper and insert the leaves one by one into those of another quire, and you will get some idea of the arrangement of the several layers. Now, the weight of the horse rests on as many elastic springs as there are layers in his four feet—about 4000; and all this is contrived, not only for the convenience of his own body but for whatever burdens may be laid on him.—*Cohnan's Rural World*.

Sea and River Fishing.

FISH IN SEASON IN DECEMBER.

Pompano.	SOUTHERN WATERS.	Sheepshead.
Snapper.	Trout, (Black Bass.)	Tailorfish.
Grouper.	Drum, (two species.)	Sea Bass.
Rockfish.	Kingfish.	
	Striped Bass, Rockfish.	

—Rather late in the season, but nevertheless welcome, comes to us a score made at weak-fishing in Princess Bay last August. The writer is one of those whose business will not admit of long vacations or excursions to Canada or the West, and he wishes our readers to know what can be done in the way of fishing within an hour and a half of New York. He says:—

"I left my business at 3 o'clock, went to Fulton Market and bought a half-dozen shadders, hurried up and caught the Staten Island 4 o'clock boat, bought tickets for Huguenot, and arriving there rushed down to the beach and pulled a half mile out to the fishing ground, and then tied up to a stake. When I looked at my watch, it was about 6 o'clock. In two hours thereafter I had caught with rod and reel sixty-one weak fish, weighing in the aggregate 111½ lbs. Now, how is this for two hours' fishing only one hour and a half from New York? I know you will say: "Hurrah for Princess Bay! next season." **REX.**

—Herewith we introduce another gentleman who wishes to be heard on the Black Bass Fly Question:—

FOND DU LAC, Wisconsin, 1873.

EDITOR FOREST AND STREAM:—

As the Black Bass Fly Question seems thus far to be a record of experience in different localities, with good evidence on both sides, I take the liberty of contributing from my observation further proof in the affirmative, so far as the finest fishing grounds in this vicinity have been examined.

I confess I was not a little surprised at the negative articles that first appeared in your journal, as my knowledge of Fly Fishing and the Black Bass, were so inseparably connected, that I should as soon thought of affirming that snipe could not be killed on the wing as to say that Black Bass could not be taken with the fly; and I have been on the look out for a reasonable solution of this problem from some of your many scientific correspondents, as it seems hardly possible that the genuine Black Bass in waters so nearly alike could be endowed with such decidedly adverse characteristics, and I trust the coming season may not pass without a closer investigation of this peculiar trait as it now stands recorded.

Lake Winnebago, Wisconsin, furnishes some good ground, that in the vicinity of Garlic Island furnishing the largest and best fish, which are readily taken with the fly, even at times when the native bait (craw-fish or minnows), hardly provokes a nibble, and at no time except perhaps wild rainy days, does the fly seem to be neglected for other bait.

The rapids of the lower Fox River, the outlet of this Lake, also furnish some of the finest of sport. Kaukauna rapid in particular, nearly a mile in extent, is a wild eddying part of the stream, grand in its scenery and rich in ragged shelving rocks and dark deep pools, that are well filled with large, dark colored, rather slim, active fellows that are no burlesque on western civilization; and the Nimrod that can preserve his light tackle in order, and retain his fish in some of the headlong races he must make down the stream over boulders and brambles with one of these fellows on the lead for his favorite pool, must lose all thought of self and the consequence of a disordered appearance at the close of the race.

This rapid in particular is more successfully fished with the fly than all other kinds of bait, and it is not unusual to secure a goodly number of nice large fellows with the fly when not a single rise can be provoked with live bait; and my experience in this locality has been so decidedly unexceptional that I only think of providing myself with fly hooks and light rod.

One peculiarity is perhaps worth noticing, as I have thus far been unable to designate any particular fly that seemed the better, and have often changed decided colors to test their preference and have found no apparent difference.

In conclusion, I beg to assure you of the hearty approval and support I am certain must be extended your journal by all lovers of true manhood, as it has given me great satisfaction to notice the decidedly uncharacteristic style apparent as compared with other so called sporting papers; and unless the "true ring" is a myth with us, there will come up to you from the conscientious sportsmen of America a hearty, generous support, that will continue so long as the present high standard of truth, honor and excellence is maintained in the conduct of the FOREST AND STREAM.

MILLS.

Of course we can do nothing less than make our best bow to the foregoing hearty endorsement, and still labor to deserve it. If we were not too modest, we should fill our paper each week with these encomiums. But then, what sport would there be in that?

EDITOR FOREST AND STREAM:—

I have read your interesting article upon the "Michigan Grayling" in No. 17 of your interesting paper. I am confident that this fish or Richardson's *Thymallus Signifer*, is a habitant of one of the rivers emptying into the St. Lawrence at Three Rivers, Canada, about midway between Montreal and Quebec. It is known there under the local nomenclature of "Spearing," which fact has probably served to prevent identification. The fish known at that place under the above "alias" is most likely Richardson's, or another

species differing from either that or the Michigan variety, as it is reported as attaining 5 lbs. weight; or it may possibly be the fish abounding in the upper waters of the Sauganay, "the Winnemish." "NOTES."

—Here is rather a novel fish story from a Canadian correspondent. By the way, do not the narratives of our Kanuck friends show that they are rather more advanced in the matter of "roughing it in the bush" than we of "the States" are?

"I was living at Fredericton in the summer of '59, and often strolling on the banks of the noble river on which that picturesque little town is situated, I observed large fish, that, on enquiry, turned out to be 'sturgeon,' leaping at intervals high out of the water. It was a common pastime, I was told, on the part of the fish, to do this, and I became smitten with the insane idea, that, to capture one of these by harpooning him in some manner, I should be happy for the remainder of my natural life. After due reflection, I resolved to make the attempt, and I therefore consulted an Indian as to the pleasure of his society on the projected trip. Great preparations were made at least a week beforehand; an iron spear fitted to a pole, with a line attached, was got ready; torches of birch bark, some grub and a flask of *eau de vie*, were stowed away in the canoe, and one beautiful summer afternoon, or rather evening, we embarked in our 'birchen craft' and began our journey. I must rest awhile here to say I was not altogether ignorant of the management of one of these specimens of 'Milicete' naval architecture; in fact, I considered myself a most perfect 'Indian' in paddling, poling up stream, standing upright, and other accomplishments for which the Aboriginal is celebrated, and for which, it may be, I am not. I say it may be, because I have heard remarks the reverse of flattering concerning my performances in this specimen of acrobatic absurdity, and there is perhaps a possibility that the persons who made them knew what they were talking about.

Having stated this, I will proceed. We wended our way slowly and quietly along the shore until we reached 'the Islands' around which we hoped to meet our giant prey. On our arrival there, tea and tobacco, those staple articles of the grocer's stock, were discussed, and, Wellington-like, we prayed for darkness. When night had cast her sable mantle round, (I am afraid, though, that's not original; besides, I shall break down if I attempt being 'flowery,') we lighted our torches and proceeded to search the rapids. Hour after hour passed with no result; still, we persevered. Torch after torch we burnt, with no sturgeon in sight, and I had almost resolved to give up in despair, when beneath me, in a deep hole, I saw unmistakably a huge monster. 'Round with the canoe! give me another torch,' I excitedly yelled at my companion, and quickly lighting it and placing it in the bow, I poled back to the spot; and with a vigorous thrust of might and main, I drove deeply into my victim the barbed spear. Alas! must I confess it? my sturgeon was nothing but a huge log sodden with water. Thus secured to the bottom, and tapering from one end to the other, it was really fish-like in appearance. Oh! how disappointed I was at the deception; besides, my spear was so firmly imbedded in the wooden imitation, I could not extricate it. After pulling and tugging for some time, I got it away, but not before damaging the pole it was attached to—that I succeeded in 'springing' in the middle, rendering it most liable to break easily. We were drifting, five minutes after this, with a very dim torch, down the 'Grand Pass' where the current runs at the rate of somewhere about six or seven miles an hour; I remained standing in the bow of the canoe with the damaged pole in my hand; we were going full speed, and were just on a rock when I, putting this article into the water quickly to push her head off and thus escape shipwreck, leaned too heavily upon it, and it broke in two. Over I went, upsetting the canoe and the Indian with it. I reached the shore, but he had unfortunately boots on, a present from some patron, and not the conventional 'mocassin,' and these became in some way entangled, so that both himself and his 'bonny bark' were in a fair way of drifting back to Fredericton, or rather part of the way, had I not rushed down the bank, or shore I think it was, and, getting well ahead of this precious raft and cargo, hauled them ashore. Such drowned rats we must have looked! such pitiable objects! We emptied the water out of the canoe, and (he having saved a paddle unconsciously, by keeping a convulsive grasp on it while in the water) set off in search of our missing articles.

We had no light, and, finding our groping blindly in the dark was useless, we gave it up. The misery I experienced going home that night, few can imagine. I had lost my coat, I was wet to the skin, my spears were gone, my 'comforter,' in the flask that would have warmed my chilled blood, had, alas! vanished also. I had damaged the canoe, for which I would have to recompense the Indian, and for his clothes, and I had only the extreme consolation that I would be unmercifully 'chaffed.'

It's needless to say I have never since attempted to capture a 'sturgeon.' I have never been fired with such a laudable ambition from that hour; but I often laugh when I think of our ludicrous and unexpected bath in the 'Grand Pass' of the mighty St. John."

—Friday, December 14th, a sword-fish, four feet long, was caught in the St. John's River near Jacksonville Florida.

—Three codfish, weighing six pounds each, were caught in the St. John's River near Palatka, last week, the first of the kind ever caught in southern waters. The *Herald* says: "Capt. Vogel, of the steamer Dictator, pronounces them genuine codfish."

—From the Maine *Farmer* we take the following interesting item in regard to salmon breeding at Bucksport:

"The remarkable success in hatching salmon attained by Mr. C. G. Atkins, last year, is well known, but it promises to be excelled by this year's operations. Mr. Atkins has put in the pond connected with the hatching establishment about the same number (600) fish, and has taken out the same number (400) each year. He would have taken out more this year but for the premature cold and ice. Last year he obtained 1,500,000 eggs; this year he has taken 2,300,000, but the breeding will probably be delayed by the early cooling, and the extremely low temperature of the water. He has 3,000 young California salmon that are doing well. These are all he saved from the 50,000 sent, as by an oversight the eggs for Mr. A. were delayed so long in transit that most of them were 'spoiled.'"

Shot Gun and Rifle.

GAME IN SEASON FOR DECEMBER.

Moose, *Alces Melchies.* Caribou, *Tarandus Rangifer.*
Elk or Wapiti, *Cervus Canadensis.* Red Deer, *Caracus Virginianus.*
Rabbits, common Brown and Grey. Squirrels, Red Black and Gray.
Wild Turkey, *Meleagris gallopavo.* Quail, *Ortyx Virginianus.*
Ruffed Grouse, *Bonasa umbellus.* Pinnated Grouse, *Cupidoria Cupido.*
All kinds of Wild Fowl.

[Under the head of "Game, and Fish in Season" we can only specify in general terms the several varieties, because the laws of States vary so much that were we to attempt to particularize we could do no less than publish those entire sections that relate to the kinds of game in question. This would require a great amount of our space. In designating game we are guided by the laws of nature, upon which all legislation is founded, and our readers would do well to provide themselves with the laws of their respective States for constant reference. Otherwise, our attempts to assist them will only create confusion.]

—A grand pigeon shooting sweepstakes, open to all comers, will take place at Fleetwood Park December 30th, for a purse of \$1,000; ten per cent. entry; eight to fill; entries to close at Jesse Smith's Astor House Billiard Room on December 29th, at four P. M. To shoot at fifty single birds, each one and three quarters ounce of shot; otherwise, the shooting to be governed by the Rhode Island Sportsmen's Club. Prizes—\$400 to the first, \$300 to the second, \$200 to the third, and the fourth to save his entrance. This, we hope will be a match where the best shooters will win. The shooters, and especially those coming from a distance, may rest assured that nothing will be left undone to make this the most successful affair of the kind every held in New York. Trains leave the Grand Central depot for the Park in ample time for the shooting, which will commence at twelve o'clock precisely.

—A Currituck, Virginia, sporting friend thus writes to us:—"Geese ever so many; duck not so plenty. Brant—hard to get them to stool on account of the scarcity of young brant. A great many gentlemen gunners down here, principally from New York, Philadelphia, and Baltimore. The weather has been too soft and mild, and no end of fogs. Have the ducks all left you yet?" [No; a great many birds were seen on Monday, December 21st, on the feeding grounds of South Oyster Bay, Merrick Bay, and West Hampton. Ducks flying by the thousands to the southward of Montauk Point.]—Ed.

—A pigeon shoot of more than ordinary interest took place last week at Ditmar's, Flatlands, L. I. The birds were of the very best, strong on the wing, and nearly all driving birds. The shooting was excellent, and is the best average made by the several gentlemen during the year:—

PRACTICE MATCH, 21 YARDS RISE, 80 BOUNDARY.

	Shot at.	Killed.	Gun used.
Sherman.....	17	15	10-bore Purdy B. L.
E. Madison.....	14	11	10-bore Greener B. L.
J. W. B.....	15	14	10-bore Greener B. L.
Dr. W.....	18	15	10-bore Dooley M. L.
A. Ditmars.....	18	12	12-bore Richards M. L.
S. Lott.....	15	11	12-bore Scott M. L.

—The Buffalo Pigeon Shooting Tournament commenced on December 17th, and was in every way a great success. This shoot was open to all amateurs in the United States and Dominion of Canada. The first prize was \$150; second prize, \$125; third prize, \$100; fourth prize, \$75; fifth prize, \$50; entrance fee, \$15. The match was shot from H and T ground traps at fifteen single rises, twenty-one yards rise, and eighty yards boundary. There were forty-nine entries. The following is the result of the day's shooting:—Newell, Schultz, and Weighell each killed fourteen; Wilmer, Bear, Marsh, and Lansing, thirteen; Green, Smith, Jones, Farrar, Miller, Clay, and Dorr, twelve; McElroy, eleven; Loff, Wheat, and George Smith, ten; Joll, Sheffield, Melvin, and Tyler, nine; Nash, eight; Richmond, seven. The pigeon shooting terminated on the 18th. The following are the names of the winners of prizes:—Robert Newell, of Buffalo, first prize, \$150; E. P. Fish, of Buffalo, second, \$125; H. M. Clay, of Buffalo, third, \$100; J. C. Haskell, of Boston, fourth, \$75; George Smith, of Buffalo, fifth, \$50.

—A correspondent (L. S.) from Brooklyn, Wisconsin, states that Mr. Powers, with two other gentlemen, and guide, four guns, two spaniels, and two retrieving setters, killed in a four days' hunt thirty-six quail, seventy-two wild ducks, various kinds, forty-six grouse, fifteen wild geese, and one black swan.

—At Mount Airy, Virginia, some one hundred and fifty miles from Lynchburg, three college students, accompanied by two "whiffets," with a Clumber retriever, killed last week thirteen rough grouse, three turkeys, seventeen quail, and one buck fawn.

—At Lincoln, Illinois, Captain Tevan and a party of five, with two guides, and three brace of dogs, in five days made the following enormous bag:—Fourteen woodcock, seven English snipe, 436 wild fowl of all kinds, twenty-seven geese, one brown cinnamon bear. We have to thank Captain Tevan for a noble portion of the young bear.

—Captain Bogardus, the American champion pigeon shooter, and Mr. F. Charleville, attracted at Oakland Park, New Orleans, on December 15th, a numerous assemblage of spectators, including nearly every notable patron of the sport of pigeon-popping. The day was too cold and the north wind too lively for a satisfactory display of the contestants' abilities, despite which, however, the shooting on one side, at least, was noteworthy. The terms of the match provided for the shooting at twenty-five single birds at thirty yards rise, which latter proviso, involving a greater than the customary distance, must be especially noted in estimating the merits of the performance. Mr. Bogardus shot out his opponent at the tenth bird. Annexed is the summary:—

Bogardus—1, 1, 0, 1, 1, 1, 0, 1, 1, 0—7.

Charleville—1, 1, 0, 1, 0, 0, 1, 0, 0, 0—4.

Touching Mr. Charleville's score, it may be mentioned that the majority of his birds were what is known as "tail birds," and pigeon shooters will at once understand that they are not to be hit every time. For the wind-up of the day's sport, Captain Bogardus attempted the feat of killing twenty-five birds in four minutes, using four traps, with two birds in each. After the initial effort it was found that the traps worked badly, when the experiment was continued by shooting the birds thrown up by hand; but this plan did not work satisfactorily, and the project was deferred until Sunday, 21st instant; but from the evidence offered the pigeon shooters in attendance were unanimous in their opinions that Captain Bogardus can perform the feat. The next exhibition will occur at the same place on Sunday, 21st, when, in addition to his second attempt to kill fifty birds in eight minutes, Captain Bogardus will also shoot with Messrs. LeBreton and Charbonnet a match at double birds, twenty-five yards rise. Herewith, it will be in order to recite that Mr. Charbonnet will on that occasion undertake to perform a similar feat of killing fifty birds in eight minutes, provided that the birds be furnished him, and pledging himself to pay for the same if he fails to perform the task. The debut of the champion here has convinced our pigeon poppers that he is a "stunner," and that no man in this section of the country can begin to equal him in point of skill.—*New Orleans Times*.

—Good for the ladies of Terra Haute, for there is a true Diana among them, and perfectly authenticated. Of course she eschews the golden bow and silver arrow, at least for game, and takes to a breech loader. Think, then, of this wonderful woman going out one day this month and killing forty-three pinnated grouse, and the next day, to keep her hand in, laying fifty-one more at her feet. It took two gentlemen to follow her, and pick up and carry her game. "Mr. Editor," writes our informant, "that young woman never missed a bird. She disdained killing her birds at close quarters, but would allow them to have a fair flight before shooting them. It is not only her being a quick shot, and a certain one, which is remarkable, but the fact that she can carry a gun weighing eight pounds all day and not tire under it; and as for tramping it across the prairies—well, please in the future never bring up as an example in your excellent paper any of those English ladies. They would have had to give up alongside of Miss —. Five mortal hours did I follow that fair sportswoman, crying 'enough, enough,' but she smiled, and was only anxious whether I could let her have a few more spare cartridges. Miss — reads the FOREST AND STREAM, and whether it may be a compliment to the paper or to yourself, Mr. Editor, in a gustatory sense, she hunted just one half hour for you exclusively, and killed eight birds. I have added five more, which makes the baker's dozen, which we both send with kind regards.

"Sincerely,

"A. G."

[The birds are not yet at hand, but we expect them impatiently. When they do come we shall have them served up with all due pomp and ceremony. Perhaps, like Sancho Panza's uncles, who were famous wine tasters, we may be able to distinguish the birds killed by our Terra Haute Diana from the others, for they will be undoubtedly the sweeter.]—Ed.

—From our correspondent in Yates county, New York, we have received the following in regard to the game of that region:—"The birds are the ruffed grouse, woodcock, quail, and wild ducks, and as to fur-bearing animals the mink, musk rat, red fox, grey squirrel, and grey rabbit are found. The forests are suffering from over-cutting. Hotel accommodation of an excellent character can be found at Penn Yan. The sporting club of the county is called the Forrester Club of Yates county, of which Mr. John C. Shutz is President, and Mr. C. Elmendorf the Secretary."

—A valued correspondent in Crow Wing county, Minnesota, speaks of deer as being most plentiful in that region. Mentioning a mighty hunter, Sleeper by name, he says he killed ten, and that Kirk brought down five just for the fun of the thing. "The professionals," continues our Crow Wing friend, "have piled up the deer all over the woods, and still there seems to be quite as many as ever. Venison in the carcass is a drug. Saddles are worth from six to seven cents a pound. I saw a man refuse to carry home a fine saddle the other day as a gift. It was 'too heavy,' he said, 'and he had kind of soured on venison.'"

—A correspondent of the *Halifax Reporter*, writing from Marble Mountain, Cape Breton, says a neighbor caught a moose calf the other day. He was taken in the water while attempting to cross the harbor, and is consequently without hurt and is doing well. The correspondent writes this, fancying some one there may want to buy the calf and raise him as a pet, or something of that kind.

—A thoughtful correspondent in Florida sends us the following interesting account of game in his particular neighborhood, which is well worthy of attention:—"Within eight miles of Mellenville we have deer, bear, panther, turkey, snipe, quail, duck, plume birds of various kinds, such as white heron, pink curlew, blue heron, &c., squirrels, foxes, mink, otter, sand-hill crane, and hosts of other fine game. Deer, bear, and panther are hunted with hounds, and a fine pack can be collected on short notice. Fox hunting is good sport, but our foxes climb trees, and last night, after a two hours' chase, and treeing twice, Reynard got away from us. Strangers will find plenty of gentlemen who have hounds, and know the stands, who are always willing to give them sport.

"William M. Humphries and Count Nersgaroo are the most noted deer stalkers, and have each killed over 2,000 since 1867. They reside near Mellenville. We have no game laws. The finest hunting ground is the southwestern part of Orange county, on the coast. The country is invariably too rough, being covered with saw palmetto, but in the interior a carriage can be driven one hundred miles through the pine woods, with scrubs or thickets on every hand, where the deer can be "jumped" at all times.

"Our only mode of travel is by steamer on the St. John's River, and hunters should take a team and wagon at Mellenville, with tent and supplies to last a few days, and about forty miles from Mellenville they will find the best hunting ground in America on Davenport Creek.

"We have hotels here, but none in the hunting grounds. We have no sportsmen's clubs yet. Fish abound in all our streams and lakes, but I am not an angler, and would not venture to give advice. "J. A. M."

SALEM, MASS., December 15th, 1873.

EDITOR FOREST AND STREAM:—

Among the remarks in *Fin, Fur, and Feather* about the resorts of game, is the following upon the "upland plover." It says "it is the least maritime of their race," (true); and also says, "and never visits salt marshes or water meadows of any kind." I do not think this is correct, as I have seen them on snipe ground in the spring at Newburyport. They are common about the hills of Ipswich Neck from August until frost, and some of them breed, but I have never seen a nest. Though generally shy, they are taken comparatively often, and I have repeatedly seen them alight upon the marshes and slough holes which intercept these hills, and further, I have, when in a booth, decoyed and shot them; but, though often answering the whistle, they will seldom be decoyed, and about here are considered the most difficult of our bay birds to shoot. It may not be generally known to sportsmen that the bird is no plover at all, but a "tattler," (*Actitis bartramia*). I do not know why it is called a plover, as it has very few characteristics of the *Charadriidae*. My experience, as above, with this bird may be an exception, but as it is the result of careful observation I present the same to your readers. Yours truly, R. S. NEWCOMB.

—A correspondent from New Orleans tells us teal and duck are coming in quite lively into the bayous, and speaks of Rigolet's and Miller's Bayous as swarming with birds. The New Orleans markets are full of wild fowl, and pirogues are at a premium.

Yachting and Boating.

All communications from Secretaries and friends should be mailed not later than Monday in each week.

HIGH WATER, FOR THE WEEK.

—The Columbia Yacht Club held their regular meeting at the club house, foot of west Fifty-seventh street, last week to elect officers for the coming year. The following were the choice of the members: Commodore, John S. Gave; Vice Commodore, R. McWhinney; Secretary, James A. Smith; Treasurer, Robert Wilson; Measurer, F. Pabst; Steward, J. P. Smith.

—The Brooklyn Yacht Club held a special meeting in the club house, at 26 Court street, Brooklyn, last week. There was a large number of members and their friends to witness the distribution of the prizes won by the competing yachts during the regatta of June last. W. P. Ostrander, Esq., presided. Vice Commodore Dickerson, in presenting the two prizes won by Commodore Voorhis, of the celebrated Schooner *Madeleine*, made a happy speech. The first of these, the club prize, was a magnificent mandoline; the second, the flag officers' prize, a beautiful silver fish knife. The Commodore responded, thanking the members for their uniform kindness and courtesy. Then followed the presentation of the Union prize to the *Fleur de Lis*, Vice Commodore Dickerson. First class sloops: *Vision*, Joseph J. Alexandre, silver ice-tongs, flag officers' prize, and two bronzes, American birds in full flight, the club prize; *Undine*, Brasher and Fowler, Union prize, dozen silver desert knives with pearl handles. Second class sloops: *Sophia*, Chauncey N. Felt, two oil paintings, (not yet finished); J. T. Seagrave, Nceanic Club, silver wine castor, Union prize. Third class sloops: William T. Lee, Chauncey N. Felt, two oil paintings, (not yet finished); Brooklyn, William Edgar Morris, large marine glass, Union prize.

—Now that our northern waters are closed by ice, and snow covers the ground, nothing seems left for us jolly yachtsmen but to haul down our burgees, make everything snug a low and aloft, up kelly, and get into winter quarters. Little is being done in yachting and boating circles, though preliminaries are being arranged for the season to come. When any news of progress made is obtained by us, it will appear in these columns under its proper head.

Yachting is not one of those diversions that belong to the Christmas season. At the frozen north it is the ringing skate and merry jingle of the sleigh-bells that make the holidays joyous and enjoyable. In the Middle States it is coursing the hare or night hunts for opossums and coons. Even in North Carolina and middle Georgia the water-courses are sometimes skimmed with ice, and the hoar frost whitens the fields. Certainly, yachting has no interest or claim to attention when the Yule log burns. Flirtations under the pennant must give place to blushes under the mistletoe. The "wet sheet and flowing sea" have no affinity with the snap dragon and holly. It is true that in genial southern climes—in those flowery realms of low latitude, where no frost nips the orange buds, and the cape jessamine and oleander grow to stately trees, yachting is indulged in throughout the winter months, and jaunty steam yachts cruise up and down the Indian River and St. John, or thread the intricacies of the Kissimer and Ochlawaha. But as we must make up our portfolio from sources more accessible than Florida, we shall winter our yachts, house our shells and barges, and wait till the coming spring once again invites our practice crews to open waters and straight-away courses. Fain would we, if consistent with our avocation, board some jolly yacht that is even now lying at Jacksonville with steam up, waiting only the arrival of its last hamper to start to the upper waters of the St. John. We would gladly enjoy again our well-remembered sailing excursions on Lakes George and Monroe, or our boating expeditions into lagoons and bayous in quest of ducks, egrets, and alligators. Many a pleasant cruise have we taken at Cedar Keys and Fernandina, and down the bay at St. Augustine to the lighthouse, where great ray fish scull lazily over the shelly bottom at the bar, and great dorsal fins of sharks cut the water in the channel ways among the reefs. Even now, at the beautiful St. Lucie, our FOREST AND STREAM commissioner and special correspondent, Fred. Beverly, has his chosen camp, fitted out with boats and guides and all things needful, with full access on the one hand to Indian River and its beach-bound channel two hundred miles in length, and on the other to the water courses that thread the mysterious and intricate recesses of interior Florida. If it were possible, we would join him there, and aid in gathering an ample store of pen and pencil sketches for the entertainment promised at some future day; but circumstances forbid. And so, herewith, we dip our pennant thrice to the yachts and yachting memories that are fading away from sight and mind, and bear away for snug harbor and winter quarters.

THE ARGONAUTA ROWING ASSOCIATION OF BERGEN POINT, NEW JERSEY.

Although comparatively in its infancy, this club has a history its members may well be proud of. Their active list shows eighty members, and their beautiful boat house, situated on the banks of the Kill von Kull, is stocked with a number of boats unequalled by any club in this country, comprising one eight-oared barge, two four-oared barges, one English six oared shell, built by Jewett; one six-oared shell, built by Fearon; one six-oared gig, four four-oared shells, two pair oared boats, two double sculls, fifteen single sculls, and one Rob Roy canoe, making a total of 31 boats. The officers of the Association are Mr. A. R. Warner, President; L. L. Spring, 1st Vice President; Charles W. Fuller, 2d Vice President; E. W. Humphreys, Captain; E. R. Craft, Treasurer; W. F. Hobbie, Corresponding Secretary; B. Stephenson, Recording Secretary. The initiative of their rowing the past summer was their club regatta on the 4th of July, in which they rowed two sixes, two fours, two pair oared, and a single scull race, a number of boats and oarsmen that scarcely any other rowing association in this country could rival. Their next appearance was at the Saratoga Regatta, where they entered a four-oared shell against the Pape Club of Cincinnati, the Duquesne Club of Alleghany City, Pa., the Beaverwycks of Albany, the Ballston Club of Ballston Spa., and the Potomacs of Washington, D. C. This race was 1½ miles and return, and though they did not win, they came in a good second, 55 seconds ahead of the Beaverwycks of Albany, and it is but fair in this connection say that their bow oar, Mr. Smith, had been sick for two months previous, and had only rowed with the crew four times before the start. At the National Amateur Regatta, which was rowed on the Schuylkill river at Philadelphia, on the 7th and 8th October, they entered a four-oared crew, a pair oared crew and a single scull, the gentlemen composing the four-oared crew were F. C. Eldred, stroke; B. Stephenson, Walter Man, and Ed. Smith, bow. In the first day's heat they were drawn against the Nassau Club in a mile and one-half straight away race. Taking the lead from the start they came in winners in 8 minutes 16 seconds, beating their antagonists 29 seconds. The next day Mr. Smith rowed a single scull race against Dr. Russell Withers of the Atlatant, in which Smith was ahead from the start, winning in 10 minutes 43 seconds, while his opponent was 29 seconds behind. Mr. Smith declined to enter for the final single scull heat, having already participated in three races that day. The final heat of the fours was the next heat in which they were engaged. Their opponents were the Analoostans of Washington and the Quaker City of Philadel-

phia. In this race the Argonautas were again successful, winning in 8 min. 36 seconds, the Analoostans second in 8 min. 42 seconds, and the Quaker City third in 9 min. 10 seconds. This final heat of four-oared shells won for the Argonautas the Challenge Cup offered by the National Amateur Association at their first annual Regatta. Following the race above named was a pair oar and double scull race, in which they entered Eldred and Smith in a pair oar against Addicks and Taylor of the Vespers of Philadelphia, in a pair oar, and Steel and Witmer of the Crescent Club, also of Philadelphia, in double sculls. This race was won by the double scull boat of the Crescent Club, the Argonautas being second. On the 18th of October they rowed their annual four-oared race against the Neptune Club of West New Brighton, S. I., in which they entered the same crew they rowed at Philadelphia, against Messrs. C. H. DeKay, stroke; W. F. Barrett, J. McMurray, Frank Bacon, bow; and seldom, if ever, have we seen so much interest manifested in a race, not only by the friends of both clubs, but by the boating fraternity generally, as was shown by the display of steamers on the water, equipages on land, and crowds of people lining both shores from the start to the terminus. This race was three miles straight away from stake-boats anchored off New Brighton, to a line opposite Elm Park Dock, and is a surveyed course of three miles. The Neptunes were first to get away, but were soon overhauled by the Argonautas, who, on passing them, kept the lead to the finish, gaining at every stroke, and winning the race in 15 min. 49½ sec, the Neptune's time being 16½. This closes their rowing record for 1873; what the rowing season of 1874 shall score, either against or for them, remains to be seen.

In conclusion we feel impelled to congratulate their President, Mr. Warner, and Mr. E. W. Humphreys, their Captain, for the very efficient manner in which they have performed the onerous duties which have devolved upon them.

Rational Pastimes.

Secretaries of University and College Athletic Clubs will please mail their reports not later than Monday in each week.

THE RULES OF CRICKET.

ARTICLE FIRST.

It has been wisely said that "those exercises which in their nature and operation have a direct tendency to draw the bands of society closer together by friendly intercourse; which substitute the feats of man for the freaks of the fop, hardihood for effeminacy, dexterity for luxurious indolence; and which, being free from the taint of cruelty, oppression and selfishness, may be pursued without shame or reproach, are entitled to special encouragement in a matter so important as that of selecting a sportive exercise for the people." Now there is no field exercise in vogue which so fully answers to the above description of a sport for the people as the English national game of cricket, for not only is it eminently social in its operation and surroundings, and especially promotive of friendly intercourse, but the pluck, nerve and courage of true manhood, the activity and endurance of a healthy *physique*, and the absence of anything of a cruel or oppressive nature, are essential characteristics of the best exemplars of the game. Moreover, the faculties of a well trained, muscular system find ample employment in the game; it is equally important that the individual desiring to excel in cricket should be possessed of his full share of mental ability in order to become a thorough proficient in all the departments of the game.

Cricket besides occupying a large space in current literature has shown its vitality by creating a language of its own. In cricket "lingo" the ball is not the ball but the "leather" or "circle;" the bat figures as the "willow;" the stumps are the "timber." A ball hit into the air is a "spoon," unless it goes a long way, when it becomes a "skyer" or a "slog." A player who scores a blank gets a "duck egg," and if he fails to score in either innings he gets a "pair of spectacles." If however he should make a hundred runs, he is said to "complete a century," and if less he "puts on forty," or fifty, as the case may be. A sentence like the following is frequently seen in Bell's Life cricket reports? "The new trundler then put down a tice, almost a Yorker, which the Surrey colt snicked through the slips for a single." This is decidedly in language of its own, and one which none but a regular frequenter of "Lord" could correctly interpret.

The earliest mention of the game of cricket in English records occurs in the "Constitution Book of Guilford," wherein it is recorded that in some legal proceedings which took place in 1598 as to the ownership of a garden, a witness aged fifty-nine years gave evidence that "when he was a scholar in the free school at Guildeford he and several of his fellows did runne and plaie there at crickette and other plaies." In the beginning of the eighteenth century we first hear of the game being played which may be strictly termed cricket. Previously the game of ball chiefly in vogue was the simple "rounders" of our school boy days, now changed to the American game of base ball. In 1780 three stumps appeared in the then "new game of ball," and in 1814 the regular game of cricket as now played was introduced.

Cricket has no "National Association" under whose authority a correct and intelligent code of playing rules can be enacted. By tacit consent the government of the game has been left since 1787 in hands of the Marylebone Club of

London, and it is this club which at present gives laws to the entire cricketing world. Our American ball playing community could no more play their game under such a badly worded and incomplete code of rules as at present governs the game of cricket, than they could be governed as a people by an unwritten constitution. Every cricketer knows that in an ordinary match at cricket eleven players figure on each side, and the eleven who obtain the greater number of runs in two innings play, are the victors, and yet there is not a written law of the game that requires this stated number or innings. Again, when a run is made through the failure of the long stop to stop the ball, a "bye" is scored, and yet not a rule in the code legalizes the scoring of such a run. In several other respects, too, is the existing code remarkably deficient. During the winter season a study of the laws of the game, their true intent and meaning, will be advantageous to our cricketing readers, and we therefore shall give a series of articles on the laws of cricket during the ensuing three months which we trust will be found alike instructive and interesting.

—William Allison, of Attleboro', Mass., ran a foot race at Washington Park, Providence, R. I., against George Forbes, of Woodstock, Canada, and came in an easy winner. James Harris, of Woodstock, ran against John Allison, of Fall River. Distance, 65 yards, for a prize of \$500. Harris won easily by 7 feet.

—At New Haven, on December 20th, George Farren succeeded in accomplishing a most extraordinary feat in pedestrianism. He had to walk to win the wager, 100 miles in 22 hours, making the circuit of the large room on the Exchange Hall 3,100 times. Mr. Farren is slightly built, weighs about 125 pounds, is exceedingly muscular and wiry, and about 25 years of age. Farren has walked against Weston's fastest time, also against that of Smith, the English champion.

BILLIARDS.

—It is more than probable that a match will take place between Garnier and Ubassy, before the latter leaves for New Orleans. It is a mooted question who is the best player. Success tells the tale.

—At Chris O'Conner's billiard room, Union Square, the other night, a gentleman amateur made 163 consecutive caroms at the four-ball game. At no one time were the balls within four inches of each other. This is billiards.

—H. W. Collender, 738 Broadway, and a friend is preparing an article for this journal on Billiard Tables; where the slate or marble comes from, where the cloth is made, and the great scarcity of ivory with such facts as we have on hand and the information from Mr. Collender, we trust to be able to prepare an interesting paper.

—Francois Ubassy and Maurice Daly commenced playing a series of six games for a purse of money at Chris. O'Conner's billiard room on the 22d of Dec. The entire match will consist of two thousand points, French game. Ubassy appeared to be in good trim, and made several shots which elicited loud applause. At one time he was 120 points ahead of his opponent. After upward of 150 points had been played Daly made the remarkable run of 99. He was very successful after this, and his next large run of 29 gave him 315 points. Ubassy then ran 7 points and made a bad miss. Daly ran 27, and won the game of 350 by 47 points. The remaining five games of the series are to be played at the rooms of Maurice Daly and Chris. O'Conner, alternately. The next occurs this evening at the saloon of the former.

—We are so crowded this week that we are obliged to leave out a report of the gymnastic entertainment at Burnham's, Brooklyn.

UNIVERSITY, Va., December 20th, 1873.

EDITOR FOREST AND STREAM:—

We have adopted the association rules as being the best rough of those mentioned in Chas. W. Alcock's book of foot ball rules. The fifteen played against thirty-five on yesterday evening—the game lasted for over an hour, both sides played well, neither gaining any decided advantage over the other—it was finally decided a drawn game, as it was too dark to continue it any longer. Our game with the Englishmen will come off on the 6th of January, 1874.

J. C. McK.

CHALLENGE TO THE AMERICANS.

With the above heading, the London *Field* takes notice of the challenge sent to the FOREST AND STREAM by Mr. Price, offering to run English pointers and setters against the same number of American dogs. "In consequence of some remarks that appeared in an article on English setters, recently published in an American paper, a challenge has been forwarded by Mr. Lloyd Price to New York, offering to run four English pointers and setters against the same number of American dogs. Sir Watkyn Wynn has consented to find the ground on his fine Welsh moors, and the challengers engage to pay the expenses incurred in sending the dogs to this country. We have never heard of any American dogs broken highly enough to compete with our English celebrities except in the article alluded to; but possibly there may be some such as are there described. In any case they will have their work cut out, as just now a very superior English team might be selected. Mr. Price had previously announced his intention never to allow Belle to run again; but, for the honor of his country, he would no doubt rescind his resolution. Mr. Macdonald had a very fine young pointer at Birmingham (not for competition, being the property of a judge), which is said to be almost as good as Ranger; and if so, these two, with Belle and Ginx's Baby from the Bala kennels, or possibly still better representative, these two kennels might fairly be considered as equal to anything in the three kingdoms. We hope the match may be made, and that we may be there to see the best team win."

Art and Drama.

GOSSIP OF THE WEEK.

BY T. B. THORPE.

THE week just passed has been without any especial incident. "The Parricide" at the Fifth Avenue, which was not a parricide, the murder having been committed by another man, was evidently put upon the stage as a make-shift until Mr. Daly could get something better. It is a curious play, and causes a great deal of speculation, among those who witness it, what it is all about. A series of interesting scenes and tableaux, all within easy reach of the manager, seems to have been adopted, and adopted without regard to their relations to each other; and then a dialogue is invented to make the scenes and tableaux hang together, something like onions on a string, but not without the onions' harmony of purpose or legitimate connection. It is a great waste of theatrical resources to put such a "crude conglomeration" on the stage. Are the playwrights to blame, or the controlling spirit of this handsome little theatre?

As we are disposed to be critical, we desire to say a word regarding that expensive "drop curtain." Red damask, however rich, is out of place on this particular occasion. The moment it descends it seems to cut the audience off from all sympathy with the stage; in fact, it acts on the mind as if a solid wall was intervened, cutting the theatre in two parts, and making the auditorium appear small and contracted; a most unpleasant sensation, and greatly interfering with the intellectual comfort of the spectators. The other evening, as the damask descended and finally rested heavily on the stage, a lady in our hearing restlessly remarked to her friend, "How smothering hot this theatre will be in summer." As for drop curtains, no improvement can be suggested over the old style of a charming landscape, made up of avenues of rich buildings, and deeply retreating valleys and mountains. If well done, the cool colors help to relieve the eye after the gas-lit scenes of the play. Then the long lines of perspective open up the stage and impress the observer with "roominess," which is a pleasant idea when one is crowded in narrow seats and compelled to look over high reaching and plume capped bonnets. People who remember the drop curtain at Burton's Chambers street theatre will recall the pleasure it afforded when for the moment it shut out the actors and scenery. It was a great piece of scenic painting, representing a Greek poet reciting his verses to a classic group of Athenians—soldiers and maids. Running back was the sweep of a harbor, the shores of which were indented with bays and enlivened with craft; high mountains reaching heavenward, their tops here and there charmingly lost in fleecy clouds. One could study and reflect, and find food for pleasant conversation while looking upon this most fascinating dream; but a damask curtain instead, suggests nothing but heat, glare, and expense without taste. In August next, if that fiery red cloud maintains itself, when it descends on a hot, summer roasted, gas-lit tormented audience, its members will be made to feel that the fiery furnace of Nebuchadnezzar, built for the roasting of Shadrach, Meshach, and Abed-nego, was, by comparison, a kind of Arctic freezer.

—Wallack's Theatre has made itself memorable by the presentation of several of the old English comedies, which give way for a new play, "adopted from the French" by Mr. Boucicault, entitled "A Man of Honor." We dislike to part with really legitimate plays, which are given at this theatre better than they can be elsewhere presented, for imitations of any kind; but we suppose managers know their business, and they are right to present what the people apparently want.

—The Union Square is crowded nightly to witness "Lod Astray." It is useless for the press to be moral beyond public demand. So far, all newspaper censure cast upon theatrical representations, the ultimate effect of which is to familiarize the popular mind with amorous intrigue, has had no other effect than to "fill the houses."

—The Olympic, after several weeks' preparation, has produced an entertainment especially for the holidays, founded upon one of Mr. Dicken's most popular Christmas stories, entitled "Gabriel Grub." We have every reason to believe that it will be popular, and receive a liberal patronage, especially from the young folks. In this piece the famous Majiltons perform their startling antics, supposed to be peculiar to goblins, and they certainly make a feature of unusual excellence.

—On Saturday night the Charity Amateur Dramatic Association, under the management of Mrs. Sheridan Shook, gave "The Hunchback" and an entertaining farce entitled "A Quiet Family," at the Academy of Music, for the benefit of the Virginians sufferers. The idea of an amateur dramatic performance, or any other dramatic performance being a success at the great building known as the Academy of Music, is almost preposterous. The great genius of Salvini never was able to warm up the stage, entirely fill the house, nor command an enthusiastic audience. The actors are so far from the spectators that they cannot be heard with any pleasure, if heard at all. With all these disadvantages, the Amateurs had really full seats, and proved themselves competent to command attention. The principle parts were admirably sustained by Messrs. Bird Cordova, and Harry Leslie, and Mrs. Shook, Mrs. Good-year, and Mrs. King. These amateur performances this winter appear to be most frequent and well sustained.

CINCINNATI, December 20, 1873.

ROBINSON'S OPERA HOUSE.

—The second week of Miss Leclercq, notwithstanding the change of prices, has been unsuccessful. "Fate" does not take very well here. Aside from Miss Leclercq, no particular merit was noticed on the part of any of the company. She will be succeeded by Robert McWade next week as *Rip Van Winkle*.

WOOD'S THEATRE.

—Mr. John Collins, the comedian, has been at this place all the week, playing to paying houses. Monday, Tuesday, Wednesday, and Thursday, "Colleen Bawn." The rest of the week was taken up by "Rory O'More."

MOZART HALL.

—The Sheridan and Mack Combination, in connection with Sharpley's Minstrels, have made a success of the variety business.

PIKE'S OPERA HOUSE.

—The old San Francisco Minstrels, with Backus at their head, have drawn the largest houses of the week. W.L.

MERCENARY TROOPS.

THE system of hiring foreigners to defend a country reached its climax in Italy. Every petty prince, every sovereign count, every marquis holding under the emperor, had his mercenaries. The free republics made a bargain with some well known captain of Condottieri to do their fighting for them for a certain annual sum. The professional soldiers thus enlisted had no desire to kill or be killed, and grew to look on bloodshed as an unfortunate accident which now and then attended an encounter of two bodies of heavy-armed cavalry. It was not until the French and their Swiss auxiliaries were confronted by the Spaniards and German spearmen, who disputed with them the spoils of Italy, that Cisalpine warfare became a gory reality. Even after the decay of feudalism, compulsory military service, in Teutonic countries, at any rate, remained the rule, but only for the defence of the realm. In England, for instance, that "king's press," which Sir John Falstaff so abused for his private profit, was a mere muster of militia against rebels or foreign raiders. The disorderly rabble that the queen's proclamation called into the field when the Spanish Armada coasted our shores was a sample of the militia of the period, and was divided, on paper at least, into two armies of great numerical strength. Lord Macaulay's speculations as to the probable result of a contest between this unwieldy mob, without discipline, provisions or officers, and the trained veterans under the skilful guidance of Parma, are moderate enough, and we can hardly wonder that no prince of the sixteenth and seventeenth century was fond of relying on a force which the necessities of the age had outgrown.

The palmy days of professional soldiering may be said, roughly speaking, to have been contemporaneous with the reigns of Tudor and Stuart. For then, abroad and at home, the fighting man was regarded as a skilled artisan, whose value in the labor market ruled high. Cromwell's splendid army was maintained on the same footing, as to pay, which James the First had fixed for the remuneration of his small force engaged in the reconquest of Ulster. At a time when the daily wages of a cloth weaver, or of a ploughman, seldom exceeded sixpence, it is evident that the soldier's eightpence, with the contingent advantages incidental to military arrangements, raised its recipient to a higher level of comfort than the average. Louvois, the thrifly disposed minister of sordid, splendid Louis the Fourteenth, first established the custom of relying on armies that were, indeed, of great numerical strength, but systematically ill paid and ill fed. Hogarth's grim caricature, in which the starveling French sentinel guards the gates of Calais, was not such a very great exaggeration of the truth.—*All the Year Round*.

GENUINE SCOTCH HOTCH-POTCH.—An English paper gives the recipe of an "unsurpassable hotch-potch," obtained from a cook in Oban, Scotland. It is as follows:—

Take the best part of a neck of mutton, cut it small, bones and all, and boil it until thoroughly well done, or until the meat separates from the bones. Then remove the bones and put in a quantity of green peas and broad beans at discretion, not to make the hotch-potch too thick; add a flavor of onions and parsley, together with a fair proportion of carrots, turnips, and kale or other cabbage, taking care to make the combination thick enough, but not so thick as to deprive it of the character of a soup and convert it into a pottage and boil the whole for eight or nine hours. If you boil it for twelve, or even twenty hours, it will be none the worse, but all the better. If there be any left, boil it up again on the next day and it will be better than on the first. The writer adds that there is a winter as well as a summer hotch-potch, the absence of peas and beans and the substitution of such other vegetables, potatoes alone excepted, as may be got, forming the difference between the two.

THE LOST DOG.—Did the reader ever see a lost dog in a great city? Not a dog recently lost, full of wild anxiety and restless pain and bewilderment, at one who had given up the search for a master in despair, and had become consciously a vagabond? If so, he has seen an animal that has lost his self-respect, travelling in the gutters, slinking along by fences, making acquaintance with dirty boys, becoming a thorough coward, and losing every admirable characteristic of a dog. That is a cat even in vagabondage; but a dog that does not belong to somebody is as hopeless a specimen of demoralization as can be found in the superior race among man at first sight, and he knows that we know him. It is a loss of his place in the world, and the loss of his chance out of his life and the spirit out of him. He has become a dog of leisure.

THE BENEVOLENT.—A gold tooth-pick can be hardly regarded as a suitable Holiday present for a starving man.

Why is Christmas like the bulk of the world's population? Because it is the great Mass of the people.

FOREST AND STREAM PRIZE LIST.

A PRIZE FOR EVERY SUBSCRIBER!

The Publishers of **FOREST AND STREAM**

In order to stimulate the development of
MANLY AND ATHLETIC EXERCISES,

AS OF
FISHING,
SHOOTING,
ARCHERY,
CRICKET,
FOOTBALL
and CROQUET,

Have made arrangements with the Manufacturers of
REMINGTON, SHARPE, AND WARD BURTON
RIFLES, AND OF THE REMINGTON BREECH
LOADING FOWLING PIECE, WITH THE
LEADING MANUFACTURERS OF
SKATES IN THE COUNTRY;
IMPORTERS OF BEST
ENGLISH ARCHERY
AND CRICKET IMPLEMENTS; WITH PROMI-
NENT CROQUET MAKERS, AND FISHING
TACKLE MAKERS,

To furnish these various articles as prizes to sub-
scribers to the

FOREST AND STREAM.

SKATES.

For \$5.00, **FOREST AND STREAM** one year, to any ad-
dress in the United States, with One Pair of Skates,
any size; with straps; Monitor Pattern; price, \$1.75.
Or Ladies' skates, trimmed toe and heel straps; brass
plate; price, \$1.75.

For \$10.00, two copies, one year, with one pair of
New York Club or Rink Skates, or The Barney and
Berry Club Skate; price, \$4.00.

For \$15.00, three copies, one year, with one pair of
New York Club or Rink Skates, nickel plated; price,
\$5.50.

Subscribers will mention size of skate required, or
send length of foot. Skates sent free of all expense.
This is an admirable opportunity to furnish boys,
gentlemen and ladies with skates.

CRICKET.

For \$5.00, one copy one year, with one College Crick-
et Bat; price \$1.50.

For \$10.00, two copies, one year, with one polished
good Match Bat, Clapshaw's make; price, \$3.00; or
one best Dark or Duke's tripple sewed cricket ball,
price, \$3.00; or one set of brass ringed cricket stumps,
price, \$3.50.

For \$20.00, four copies, one year, with one best
spring bat, one College bat, one Dark cricket ball;
price, \$7.50.

For \$25.00, five copies, one year, with a complete
cricket set; one College bat, one polished bat, Clap-
shaw; one Dark cricket ball; one set of stumps; price
\$12.00.

ARCHERY.

For \$10.00, two copies, one year, with one five feet
best English lance wood bow, bone tipped, with half
dozen best arrows; price, \$3.75.

FOOTBALL.

For \$15.00, three copies, one year, with one Rugby
football; price, \$6.00.

FISHING RODS.

For \$5, one copy, one dozen assorted trout flies, by
the very best makers, Miller, Coachman, Hackle, Green-
drake, &c.; price, \$1.50.

[The new Tribune Building stands upon the old site, and will be the largest newspaper office in the world. It will be nine stories high, and will cost, exclusive of site, one million dollars.]

New-York Tribune.

The Leading American Newspaper.

"NEVER SO GOOD AS IT IS TO-DAY."

The unlimited and unsolicited verdict of the hundreds of thousands of readers of THE TRIBUNE, is that the paper was never so good as at the present time. During the past year it has enlarged its field and improved its facilities in every direction, and enters upon the year 1874, which is to be one of the most important in public and political affairs, with most encouraging prospects. THE TRIBUNE, however, believes in deeds rather than in words, in results rather than in promises. It points to its record and its columns for the past twelve months as the best evidence of what it has done, and the most satisfactory pledge of what it will do. All the distinctive features of the paper will be preserved and strengthened; the "Extras," whose sale has reached hundreds of thousands, will be continued; the front of its new building completed, and the present admitted pre-eminence of the paper, not only maintained, but still further advanced.

As an invaluable paper for the Farmers of the whole country THE TRIBUNE fully maintains its well known and admitted position. It publishes much more matter of interest to Farmers and their families than any of the strictly "agricultural" papers, and no Farmer can afford to be without it unless he can afford also to be without all the market reports—cattle, grain and produce—information of agricultural events and progress, and all the general news of the day. To every intelligent Farmer THE TRIBUNE is simply indispensable.

TERMS OF THE TRIBUNE.

"DAILY," (by mail), one year, \$10.
SEMI-WEEKLY, one year, \$8; five copies, one year, \$12.50; ten copies (and one Extra), one year, \$25.
WEEKLY, one year, \$2; five copies, \$7.50; ten copies, \$12.50; twenty copies, \$22, and thirty copies, \$30.
Each person procuring a club of ten or more subscribers is entitled to one extra WEEKLY, and of fifty or more to a SEMI-WEEKLY. Papers addressed separate to each member of clubs will be charged ten cents additional to the above rates.
Specimen copies of either edition of THE TRIBUNE sent free on application.

Remittances at sender's risk, unless in registered letter, by draft on New York, or postal money order.

Address: THE TRIBUNE, New York.

THE TRIBUNE EXTRAS.

Extra sheets issued occasionally, and containing the latest and best things in art, science, literature, history, and religious discussions. Half a million already sold. The series of fourteen Extras now published sent by mail to any address in the United States for One Dollar. Additional Extra sheets, containing the two recent novels, "May," by Mrs. Oliphant, and "Lords and Ladies," each by mail ten cents. Descriptive circulars, giving full details of the contents of each Extra, sent free on application.

Address: THE TRIBUNE, New York.

Sportsmen's Goods.

This Rifle, after being tested in the severest manner by the late Board of U. S. Officers, appointed by the Government to select the best arm for the service; and after examining over one hundred different systems, including the best guns of Europe, say of it, "that it is the best rifle they have seen, or of which they have any knowledge. They therefore recommend it for trial in the hands of the troops. A seven pound carbine on this plan, with coarse military sights, has made better targets at Creedmoor the past summer, than the best English and American target Rifles weighing 10 pounds and having peep and globe sights.

We are now making these guns to supply the numerous demands, and will soon have them in the market.

The following is our scale of prices:—
SPECIAL MAGAZINE RIFLE for large game, carrying from 3 to 8 cartridges, 70 to 85 grs. of powder, 350 to 400 grs. of lead, 8 to 10 lbs. weight.....\$60.00
and upwards, according to finish.

SPECIAL LONG RANGE MAGAZINE RIFLE for Creedmoor shooting, 90 grs. of powder, 480 grs. of lead, carrying 3 to 8 charges, weight, 10 lbs. from.....\$100
and upwards.

MAGAZINE RIFLES for general use. Carry 3 to 9 cartridges. 60 grs. powder, 350 grs. lead from.....\$40.00
and upwards.

SINGLE BREECH LOADERS for long range Creedmoor shooting, 90 grs. powder; lead, 480 grs. from.....\$60.00
and upwards.

SINGLE BREECH LOADERS for general use, 6 to 7 lbs., 60 grs. powder, 350 grs. lead, from.....\$30.00
and upwards.

The calibre of all our rifles, unless otherwise ordered, will be .45-100.

THE SANITARIAN.

A. N. BELL, M. D., Editor.

OPINIONS OF THE PRESS.

"The Sanitary question is now uppermost in the public mind, and it is gratifying to see that the discussion of it is not going to be kept as a 'mystery' in the medical profession. Every human being is concerned in this matter; and if sanitary science has any suggestions to make, they must be made directly to the people themselves. This is what the periodical before us aims to do, and this it is doing well."—*Popular Science Monthly*.

"As its name implies, THE SANITARIAN is devoted entirely to Sanitary Science, in its liberal and proper sense. The field it occupies is a most important one, and the editor admirably qualified for the work he has undertaken."—*Medical Examiner*.

"Consistent with his announcement, Dr. Bell seems to have spared no pains to secure for the Journal the continued approbation of the public, by treating, in a clear yet comprehensive manner, of subjects with which the public are directly interested, and the importance of which cannot be overestimated."—*Appleton's Journal*.

"This is a Monthly Journal, containing original essays on various Sanitary topics, by some of our most prominent medical scholars, popular enough to be read with profit by every person who reads, and learned enough to be of great interest to medical men. It ought to be read and preserved by every family, because it teaches how to avoid numerous causes of disease, and to support health and vigor."—*The Israelite*.

"A thorough-going Health Journal—not the cheap popular thing which generally goes current under that title, but a substantial register of Sanitary knowledge and science."—*Christian Standard*.

"Of a much higher grade than is common to our health publications."—*Watchman and Reflector*.

"THE SANITARIAN ought to be in every family on account of the practical common sense manner in which it treats questions of public and private health."—*The National*.

Annual Subscription, \$3 in advance. Single copies, 30 cents.

For Forest and Stream.
FROST WORK.

THE beautiful foliage, the crown of the year,
Had been storm strewn and scattered withered and sere,
And the rains of the autumn were shed as a tear,
Where the withered garlands were lying.
Naked and bare to the wintry sky,
Moving their arms to the bleak winds' sigh,
Sad to the heart and drear to the eye
Were the trees, as the year was dying.

A cloud came drifting from out of the west,
Darksome and weird were billow and crest,
And the fitful gale spoke little of rest,
As the day went on to the gloaming.
No vesper of bird met the deepening shade,
No lowing of herds as they homeward strayed,
No carol of peasant or song of maid,
No sound but the breakers foaming.

A night came heavily, darksome and drear,
A morning broke beautiful, frosty and clear,
All sadness was gone, a wonderful cheer
Came like a caress to humanity.
The clouds that haunted the winter night,
Yielded their breath to the Ice king's might,
And woven in beauty by elf and sprite,
Made nature a scene of vanity.

Light as the beautiful veil of a bride,
Pure as the lilies that woodlands hide,
Fairyland visions far and wide,
Enchanting the New Year morning.
No loom e'er wove such a silver sheen,
Light never gilded a daintier scene
In marble hall or in forest green,
Than the wonderful frost's adorning.

Crested and fringed on coppice and spray,
Catching the light of a cloudless day,
Casting the hues of a diamond's ray,
Lay the snow in virgin whiteness.
Clothing anew the beech long dead,
Clinging in beads on the spider's thread,
Frosting like age the pine tree's head,
In forms of fanciful lightness.

Giving a bloom to the swaying vine,
Roses of white where the briars twine,
Bending the larch in a snowy line,
Making grove oaks fantastic,
Flinging beauty on every form,
Wayward spirit of cold and storm,
Showing a fancy weird and warm,
And art so endlessly plastic.

Child of the night, of unseen birth,
One thing pure on the face of the earth,
Whiter than foam from the ocean surf,
Fair work of a mystical power,
Telling our hearts that the darkest sky
And the saddest hours may oft go by,
When stilled like the storm; our evening sigh,
May be joy in a brighter hour.

L. W. L.

The Back Lakes of Canada.

AS was their custom, several young men of the town of Cobourg (a Canadian frontier town) met one evening in Frank Stalwart's rooms at the "North American." This was in the latter days of August four years ago—yes, it must be four years ago, and yet how fresh in my memory, in spite of the many changes, some so gladly welcomed and others so ruthlessly bitter, which have since then transpired. On this particular evening the usual gossip was almost exhausted, when Ned Benton, a young, but not briefless, barrister, proposed we should settle upon the manner in which to take a couple of weeks' recreation. Placing his pipe carefully against a book on the table, which I remember was Longfellow's Poems, my friend, Frank Stalwart, suggested a trip up the Back Lakes. Said he, "we can have a little deer hunting, a good deal of duck shooting, no end of fishing, and altogether a splendid outing." "Some prefer to 'ball it' at a watering place; what say you, Bob Bertram?" addressing myself, "and put down that novel and order in some claret and ice." "Well," I said, "I know not whether the claret will change my mind, but now I am for the Lakes. I have heard so much about their romantic scenery that I greatly desire to see them."

So it was settled that we should start on the following Monday, after having taken another evening to arrange the route and the requirements of our outfit.

Ned Benton and I, according to a previous understanding, met our companion, Frank Stalwart, at Peterborough, about thirty-five miles north of our starting point. This was done so that our friend could go by way of Rice Lake and bring over Thad. Fremont, an accomplished man in the way of dogs, canoes, and camp life on the lakes and in the woods. I may mention here that, besides his many other admirable qualifications, in all things culinary Thad. was a perfect success.

During the afternoon of the day of our arrival at Peterborough we proceeded to get together such things as are necessary for the hunter's outfit. Besides the tent, the sportsman, for two weeks of camping, must have buffalo skins and blankets, kettle, tin plates, cups, and such things, together with bacon and bread to last a few days. After that he should trust to his skill in killing to supply the board. Also, he requires a moderate quantity of tea. I believe some carry with them a small keg of whiskey; in fact, it is considered by many a necessary article on these occasions, as it is impossible to drink the lake water on account of the profuse vegetable growth of rice, lilies, and other plants and flowers, which are almost invariably present in these small lakes, and certainly add to their picturesque beauty. Having towards evening collected our necessities, we began to look for Mr. Thad., who had, unnoticed, strayed from our path. We had in prospect that night a drive of seven miles in a wagon to Bridgenorth, a village consisting of one small tavern and a boat-building shop. We wished to set out as early as possible, so as to obtain a good night's rest and be prepared for a long paddle the next day. Thaddeus, however, was not to be found, and after a diligent search we went without him, taking with us his rifle and cartridge box, and leaving word to have him taken out early in the morning in a buggy. It turned out that the young man could not refrain from visiting an acquaintance of the fair persuasion, and once in the charmer's fascinating presence he found, no doubt, it was impossible to resist the spell of her enchantments, and midnight had stolen in upon the happy lovers ere Thad. awoke to the slightest degree of consciousness. Determined to start that evening, we loaded our wagon with two canoes, ammunition, and other supplies, and ourselves, three in number, besides the driver. The wagon that held all this was very moderate in size, with easy springs, but the canoes are carried in a peculiar way. Two poles are placed across the wagon above the box and nearly over the axles. The poles extend about three feet on each side of the wagon box. Across the poles the canoes are tied, one on each side parallel with the conveyance. Thus the seats are left free. Away we went, singing merry songs, and it would, I am sure, be hard to find "three blyther lads" than we.

After breakfast the next morning at Bridgenorth, on Chemong Lake, having waited a short time for the delinquent Thad., and upon the arrival of the repentant youth, about nine o'clock, we gaily proceeded to load and trim our canoes. Having arranged to follow this chain of lakes about forty or fifty miles before settling upon a permanent camping ground for our labors, we set out, Frank and I in a birch bark canoe well laden with our guns, ammunition, and camping utensils, besides the two hounds, Woodman and Harry, in the bow at my knees. The wind was pretty fresh, and blowing directly against us, making the paddling rather hard work, and also making the water so rough that a good deal of it was shipped over the bows. This disturbed the dogs considerably, and I was obliged when they would attempt to get up on the bow to keep them down by dint of a few sharp blows on the head with the paddle. The wise creatures, however, soon became accustomed to it, and, as if they knew for what purpose we had embarked, behaved like noble martyrs. The roughness was so great that Frank and I, as well as Benton and Thad., in a broad canoe, were compelled to pull ahead as strongly as we could from island to island, and from time to time un-

load, empty out the water received over the sides of our light crafts, load up and off again. Thus, about nightfall, we got to the foot of the lake, where we pitched our tent and tarried for the night.

Chemong Lake is within the pale of civilization, the land on either side being cultivated, and some comfortable looking farm houses being within the view. The islands are numerous, and are covered with shrubs and small trees. Some of these islands are almost perfectly circular, and seem to rise out of the water like mounds, with the trees so thick and even that they often present the appearance of a beautiful green cone of foliage floating on the surface of the water.

We rose in the morning a little before dawn, and the industrious and enthusiastic sportsman, Ned Benton, sallied out in a canoe to make war upon grey-backs and mallards, while the rest of us remained to pack up and arrange for the morning meal, and as, occasionally, we heard the report of our companion's gun, the light hearted Thad. would exclaim that should he get two or three brace of ducks he would give us a stew that would make us feel like princes. In a couple of hours Ned came in with five beauties. Thad. made good his boast, and as he danced around the fire preparing the savory meal he seemed to us (unaccomplished in the art—I was almost going to say the divine art—of cookery) clad in some mysterious power.

During the night the water had become quite smooth, and we glide off. We send the canoes along with ease. Everything is calm and quiet. The sun bathes the woods that line the shore in the mellow light of morning. Fresh and soft and pure looks the foliage, as if it had sprung up like magic. Nothing is heard save our chatting voices and the musical ripple of the water, as the canoes shoot through it. Truly we feel like princes; if not as rich at least as independent.

Soon we arrived at a mill-dam, at the outlet from Chemong to Buckhorn Lake, owing to which we have to make a portage. Unloading, we carry our packs and canoes nearly half a mile, and then embark in another water. We did not go far before we came to the Buckhorn Rapids, down which we ran in beautiful style, Thad. giving us a lead. Frank and I followed in the birch bark, and Benton brought up the rear. On the right is a large mass of rock, which rises perpendicularly from the water about forty or fifty feet, and extends along the shore as many yards, sloping down like the roof of a house, and meeting smaller rocks and a rich growth of woods; on the left the water is full of boulders, and the shore thickly lined with young trees and shrubbery close to the water's edge, and even appearing to extend into it. These rapids are comparatively swift and full, but with scarcely any turns. I laid my paddle across the bow and allowed my friend Frank to pilot us through; and it certainly required no small skill in steering and handling the paddle. The sensation was truly pleasurable, and is difficult of description. At first the canoe moves slowly and evenly along of its own accord, without any assistance from the occupants, increasing in speed through every foot of space; then entering the rough waters of the rapids it shoots off like the rush of some living creature let loose from its bonds; then, making a turn between two impending rocks, it darts past within a few inches of one of them, and then, in the deepest and strongest force of the current it bounds gracefully along on the waves, as if glad that it requires not the hand of man to give it motion; and, having acquired this magical independence, it seems to leap from wave to wave, dancing in re-joicing playfulness to the tune of the singing stream, till it loses its joy and force and strength in the calm waters of the rapid's foot.

Once more we ply the paddles with some degree of force, and gracefully glide through the waters of Buckhorn Lake. The advanced morning is splendid in the radiant beams of the warming sun. The small bays that indent the right shore, skirted sometimes on one side with large flat rocks, and on the other with heavy forest trees, are entered by rivulets from the wilds and hills beyond, visited only by Indians and adventurous sportsmen. Here all traces of

civilization are passed, and the whole prospect is one of primeval nature. Pulling the three canoes abreast we pursue our way in happy commune. We leave Deer Bay on our left. It is the largest on the lake, thickly covered with rice, and its shores closely grown with trees of various types, looking in the calmness of noon time like a close wall of leaves defending the peaceful water from all intruders. Now, for a mile or two in length, the right shore rises in a sloping hill, nearly two hundred feet in height, giving the effect of a vast, closely wooded slope from the beach up, appearing to extend grandly and proudly to the silver-bordered clouds that rest serenely upon its summit. Taking a turn to the left we hear the rumbling of another rapid, and after holding a consultation as to the proper channel to run, we go down singly, Thad. again proceeding in the van. We conclude to take the side channel, and gently floating through the softly moving sweep of water at the head we turn by the edge of the rocky side with the increasing movement of the current, apparently about to rush against the parapet of solid rock in front, when the stream, by a sudden swerve, as if in merry caprice, bears us around, and then, as if angry at having carried us in safety through twists and turns, sends us with the force of its full speed over the collected volume of its bounding waves, and we enter the strangely named Lovesick Lake. Here we met another party of hunters, like ourselves. It seemed so strange—as if they had sprung up from the water by some magician's wand, after moving the whole day through scenes of enchanting wilderness and peaceful, quiet beauty, which had never in all the roll of ages been disturbed by the innovations of man. They were going, they said, to the rice beds on Deer Bay for the evening duck shooting. They told us where their tents were pitched, and advised us to establish ourselves on an island opposite theirs, which we agreed to do, having concluded previously to make this lake our permanent camping ground. Frank Stalwart had known these gentlemen for years, and hence the greeting of him and his friends was cordial indeed, our canoe and theirs having been drawn up close together. Like us, they were four in number. They told us they had that morning (their first one out) killed a deer, and it was agreed that they should visit our camp in the evening to arrange for a deer hunt in one party the following morning. It was about four o'clock in the afternoon, and in a few minutes after, we reached the island of our destination, where we at once proceeded to unload our canoes and pitch our tent. This island was one well adapted for our purpose, being elevated and dry. From where we landed the approach to the level above was steep, but the ascent made without difficulty. On the other side the rocks were perfectly perpendicular, and rose directly out of the water about thirty feet. The tent having been tightly fixed, Frank and I selected a trolling hook and line and started off in search of fish, proposing to return in about half an hour, while our two companions prepared the evening repast. Passing around the point of the island, we move under the high overhanging cliffs that skirt its side; then, as we near the border of a large rice bed, I let out the trolling line in hopes of securing the prey. In a few minutes, while Frank and I were cementing our friendship with mutual assurances of a constant attachment in the future, I felt a sudden jerk, then, as I took a firmer hold of the line, a stubborn pull. Knowing the cause was an active maskinonge, I began to haul in. Feeling the resistance, he darted forward, then to one side with a wonderfully strong plunge. As I brought him near he bounded to the surface in frantic efforts to get free, and gave us a very liberal sprinkling. A couple of quick pulls, however, and a good steady haul, laid him captive in the canoe, when, with a last desperate whisk of his tail he snapped my briar wood pipe in two like a piece of thin glass and sent the pieces flying in the air. Thus ended the history of my favorite pipe, which was carefully strengthened with a silver ferule, and thus a plump twelve pounder of the finny tribe was lost to his companions of the deep to satisfy the selfish sport of man. After catching one or two more I roll up the line, and we quietly take a sauntering sort of paddle about the edge of the lake to drink in all the native beauty of the view. I think neither poet's pen nor artist's pencil could fully and clearly describe the delight that fills the mind, or the peculiar thrill of serenity and pure sensation of awe that stirs the heart and moves the thought to involuntary devotion in such a scene. The water is as calm and smooth as a sheet of glass, supporting on its even surface large patches of rich full blooming lilies of spotless whiteness, surrounded with their broad, deep green leaves; and very carefully, without knowing it, do we dip our paddles so as not to mar their matchless purity nor disturb the sweet repose of floral beauty at rest upon the water's bosom. It seems a wanton sacrilege to displace the fair ornaments with which nature has adorned herself. The lake side is closely lined with rocks and ledges of uneven height, from out whose crevices grow tall pines and large firs without the slightest evidence of soil. The water is deep quite up to the rocky shore, and the intervening spaces between some of the moss-covered, sloping rocks are filled with a luxuriant growth of trees of numberless shapes and sizes. The autumnal variegated tints of orange, yellow, scarlet, green, and red, intermingled with the unaccountable harmony of Nature's marvellous work, contrast so pleasingly with the deep and constant color of the foliage of the heavy evergreens. These rocks and wooded growths are high and close, and nothing can be seen over or between them. There is almost an angular bend at this part of the irregular shore, forming, as it were, a temple for the appearance of the divinities of the place. The evening is

impressively still, the water is supremely calm, like the innocent sleep of a fair infant; the mild subdued light of the receding sun produces the shadows of the objects in view, inverted beneath the lake; our paddles are quietly, tenderly, with sacred care, placed across the canoe; our friendly talk is hushed; we are as motionless as the placid lilies that surround us; we are lost in the sublimity, the grandeur of Nature, fast bound in the awe of the majesty of her magic spell. At length the approach of falling night reminds us of our companions in the camp, and we return to our tent upon the island, exchanging, as we go, expressions of wonder and admiration. In the evening we gathered drift boards from the island and made seats around our camp fire, while arranging which the measured sound of paddles, and the steady hum of voices met the ear. We immediately proceeded to the shore, and there met our acquaintances of the afternoon. Their canoes pulled up, we all formed a pleasant social crescent before the fire, the can having been previously hung above the blaze in readiness for a brew with which to welcome our sporting guests. The night was cool and frosty, not very bright, yet myriads of twinkling stars sparkled in the deep blue sky. No lights or signs of any kind gave token of civilized life. Our small party of eight, gathered from various quarters of the globe (some of whom had travelled in many climes), had met on this tiny islet in a small lake, surrounded by miles upon miles of the untouched wilds of Nature, and no sound was heard save the constant rushing noise of the swiftly flowing rapids. There was Major Howard, an Englishman, now living in the neighborhood of Peterborough, and Mr. Loring, a civil engineer of the same place, with others of lively and social predilections, who all told interesting and romantic incidents of foreign travel, as well as sporting and hunting experiences in the wilds of Canada. In the clear bracing air of the autumn evening, as we smoked our pipes and sipped the warming beverage, our talk became richly savored with the hunter's phraseology. "How clearly," said the Major, "we can hear the tumbling of the rapids; the night is so calm. That point, you know, just at the head, used to be a favorite camping ground, but of late it has been rather abandoned. There have been several drowned in running through. Two poor fellows were lost the past summer."

"And why didn't they learn to swim," put in our Irish friend, Carroll, "or not go poking themselves into traps they couldn't get quietly out of again."

"But my dear fellow," replied the Major, "the eddies are so strong, you know, that even good swimmers have rather a frail chance; and as for guns, why bless your heart the foot of these rapids is fairly paved with them."

"Are you an experienced canoe-man, Mr. Bertram," the Major continued, addressing me. "You're not? well, you'll soon like it. It's a fascinating life, I assure you. Upon my life, Mr. Bertram, it's a very fascinating life; so free, and wanting care. Why, we come up here every few weeks and take down a deer or so, and a score or two of ducks. It is really very jolly, and no end of sport."

"Do you remember, Frank," said Loring, "when you and I upset on Black Duck Lake?"

"Indeed I do, old boy, and I feel chilly every time I think of it."

And then was told, at some length, how they dived and recovered their guns and some of their other traps.

"I suppose you were rather moist at the time," said Carroll, "but it makes a very dry story."

Then the tin cups were soon replenished from the steaming can and passed around the circle.

"There's one thing true," said the incorrigible Carroll, "it would never do to drink this lake water until it was boiled down."

And so the talk went on—of yachting in the Mediterranean, racing in England, and social converse concerning mutual friends and acquaintances—till we separated, about eleven o'clock, having settled to meet at dawn ready to chase the deer.

Then we spread our buffalo skins on the ground in the tent and retire for the night, well covered with blankets, beneath which we slumber soundly till the break of day. The mouth or door of the tent being open, we behold, on awaking, the waning stars, not yet entirely chased away by the fast approaching sunlight. A hasty toilet made at the lake, a hasty breakfast, and we are ready for the start. Frank Stalwart and I were stationed with our canoe at one end of our own island to meet the deer, if one should cross from the main land, and as we sat quietly waiting beneath an overhanging growth of shrubbery, projecting from a ledge of rock, said he, "Rob, did you ever hunt the deer before?"

"Not in this way, Frank; I have generally hunted in run-ways."

"And," he replied, "a run-away business I expect it was, was it not?"

"Well, it was not so much their timidity as my ineffectual aim."

"It is time, then, you had an aim in life. But you may be more successful in this method, as you get them at shorter range."

"I understand," said I, "the general theory of this mode, but will you be kind enough to give me all the minutiae?"

"With all the pleasure in life, old chap. It is in this way:—Well, there should be about five or six canoes and four or five hounds, and it is very fortunate for us we met these other fellows, as they make the party about the right strength, and afford us, with our own, the proper number of dogs. There is always an injunction understood that no firing is to take place on the morning of a hunt, as these

denizens of the forest are very timid creatures, and avoid the direction whence any noise is heard. So remember, if a half score of ducks fly under your nose you must let them pass. The guns should be loaded with buckshot, although experienced men kill sometimes with small duck shot. The canoes are stationed at different points, where the deer are likely to cross. This morning one is placed at Scow Island, half a mile or more to the right, one down in the bay, about half a mile to the left, one out at Black Duck Lake, nearly two miles away, and others I know not where. Two or three of the party go on the main land to put out the dogs. Thad., Loring, and Riggits are doing that arduous duty at the present time. When the dogs strike upon the scent of deer they are let loose. When they get within hearing distance the deer break from cover, and almost invariably make for the water as a harbor of safety from their canine pursuers. As soon as the dogs give tongue the men at the different stations are to be on the alert, and when a deer enters the water at any particular point the man who discovers him must keep perfectly still until the animal is well out in the lake, as the deer's senses of smell and hearing are extremely acute. Then the canoe, quietly and with as little noise of the paddle as possible, meets the intended game, until observed by the unsuspecting creature. Then the pursuer flies after him with all the skill he has in his power till he gains within a short distance of his prey. Then an unmistakable aim, and the discharge of the fowling piece lays the forest monarch low."

After faithfully remaining at our post about two hours or more, we heard the yelping of the hounds, which made us more sharply attentive. It was soon evident, however, we were not to have the good fortune of a chase at our station that morning, for ere long there came from a distance the report of guns. Then we knew the hunt was over, and we repaired to the tent. In about three quarters of an hour the rest of the party came in, and one canoe was the honored bearer of a plump young doe. After a time the dogs made themselves heard on the main shore opposite, and the active Thad. quickly proceeded to bring them over. So ended the morning's work.

After the midday meal we sat and smoked, or lay on the blankets basking in the sun till four or five o'clock, when we set out for the evening's duck shooting, some of the party remaining near the camp and others going up to the large rice bed near Deer Bay. And the party reassembled in the evening well rewarded with game.

Thus we spent the time; and richly did we enjoy the days as they passed. Indescribable was the pleasure of hours upon hours every day in the clear open air and sun light, with the exhilarating exercise of paddling, the inspiration of the scenery, and the excitement of the sport all commingling their various charms. We were well able before we left to verify the words of the Major, for truly did we find it a fascinating life. Our freedom was perfectly unalloyed. We had no cares of business nor the exactions of the conventional pleasures of society. Liberty was there unbounded.

But now I will not make any further narration of our camping expedition, but in another paper may say something of the conclusion of our journey and the romantic interests of these spots of nature so beautifully wild.

—ROB. BERTRAM.

FALLING LEAVES.—Many persons think that when the leaves turn red and yellow in the fall, it is because they have been killed by the frost. But a little observation will show that such is not the case, and that the autumns when the leaves are most beautiful are those in which the frost is the latest. A severe frost kills the leaves at once, and they soon fall, brown and withered. To be brilliant, they must ripen naturally, and our hot September and October mid-day suns have probably much to do with it, as in England, where the falls are apt to be damp and cloudy, the leaves are not bright, and American artists, who strive to paint our maples and woods as they see them, are unjustly accused of over coloring. The leaves fall because they are ripe, and have performed the service that was allotted them. The leaf is the laboratory of the plant, and in it are performed most of the operations essential to its growth. It takes the crude materials gathered by the roots, refines them, rejecting all that is not essential to the plant, and out of the remainder constructs the highly complex bodies that are found in other parts of the plant. These rejected parts consist mainly of earthy matter that was in solution in the water taken up by the roots, and it is deposited in the cells of the leaf. This is shown by the fact that the leaf contains far more ash than any other part of the plant. In some plants the ash of the leaf amounts to over twenty per cent., while that of the wood rarely exceeds two or three. When the cells become completely clogged up with this matter, the leaf can no longer perform its functions, and so ripens and falls off.

PREMATURE PREPARATION FOR SPRING.—The Providence Journal says:—

All the lovers of house plants know how they stagnate during the dark December days. But hardly has January come before the leaf-buds and flower-buds start out in profusion. We think of January and February as the heart of winter, yet the leaf-buds of many trees and shrubs, even in our Arctic climate, begin to swell at new years, and continue to increase during the winter.

This year we notice a particular phenomenon, interesting but unpromising, like other precocity. The buds of trees and shrubs swelled rapidly after the leaves of the last summer had fallen, and early in November were as far advanced as usually in March, or sometimes April. The summer drouth and copious autumn rains will perhaps explain this. The cold November hardly checked the premature development, and the warm December has continued it. The red blossoms are now to be seen on some of the early maple trees, and the sprays of the elm are beaded with swollen flower buds. The buds of the grape vine under our window are bulging out. We are all interested in the question: Will the fruit buds suffer?

Fish Culture.

PRACTICAL FISH CULTURE.

NUMBER THREE.

The Dry Method.

THIS is comparatively a new process in this country, or rather, new to most fish breeders, as it is claimed that some of them used so small a quantity of water as to almost entitle them to call it dry impregnation, before the discovery was announced in America, but the first public announcement of this process was made in the *New York Citizen* of May 27th, 1871, by Mr. George Shepard Page, of New York, who caused an account of the experiments of M. Vrasski, at Nikolsk, Russia, to be translated. These experiments were made in 1856, and therefore the Russian was fifteen years in advance of us on this point; and although the writer does not accord it as high a place among piscicultural discoveries as others have done, who have predicted that it would be universally adopted and entirely revolutionize the manner of taking spawn, which, by the way, it has not done at present writing, for of those who take trout spawn by hand at present, I do not know of more than two who practice it in all its dryness, and they are a little enthusiastic on this subject. The writer was employed by Mr. Green last spring on the Hudson, and water was always placed in the pan before stripping the shad, and although Mr. Green uses water in the manipulation of salmon-trout, it is small in quantity, as it always has been with him; hence, his success, which was wondered at by those who drowned their milt in a panful, as did M. Vrasski in his first experiments.

In order to fully understand the principle of dry impregnation, it will be necessary to glance at the construction of the egg and the vitalizing principle of the milt.

The egg is provided with two coats or membranes, the inner one enclosing the yolk, and between this and the outer one is the space that fills with water, milt, or both, as the case may be, which causes the egg to "free," as mentioned in the last article. This outer covering is provided with a funnel-shaped opening, called the micropyle, through which fluids are absorbed.

The milt contains numberless pin-shaped filaments, which, as they are endowed with motion, I have called animalculæ, for the use of which term Mr. Charles Bell took me to task before the American Fish Culturists' Association. They are known to science as spermatozoa, or zoöperms, and Mr. Bell quotes Dalton so effectively that I am certain that I will never commit so grave an error again as to call zoöperms "animalculæ."

Claiming, as I do, nothing but practical knowledge, an error in scientific nomenclature, especially in physiological science, may readily be forgiven. Mr. Bell says:—

"I will submit the evidence on both sides to the Association, and they shall decide, not whether we shall call them 'zoöperms' or 'animalculæ,' but whether they are living animals or simply shreds of albumen."

The following extract is from Dr. Dalton's "Treatise on Physiology," published in Boston in 1859:—

"The most remarkable peculiarity of the spermatozoa is their very singular and active movements, to which we have already alluded. If a drop of fresh seminal fluid be placed under the microscope, the numberless minute filaments of which it is composed are seen to be in a state of incessant and agitated motion; this movement of the spermatozoa, in many species of animals, strongly resembles that of the tadpole. * * * The tail-like filament keeps up a lateral and vibratory motion, by which the spermatozoon is driven from place to place in the spermatid fluid, just as a fish or tadpole is propelled through the water. In other instances, as for example, in the water lizard, the spermatozoa have a writhing or spiral-like movement, which presents a very peculiar and elegant appearance when large numbers of them are viewed together; it is the existence of this movement that first suggested the name of spermatozoa to designate the animated filaments of the spermatid fluid, and which has led some writers to attribute to them an independent animal nature. This is, however, a very erroneous mode of regarding them, since they cannot properly be considered as animals, notwithstanding the active character of their movement, and the striking resemblance which it sometimes presents to a voluntary act. * * *"

It is the entrance of this zoöperm, while still active, into the micropyle that fecundates the egg, and its introduction to water stimulates it to greater activity for a moment or two, after which it dies.

The following extract from the article referred to in the *Citizen*, tells how it was discovered:—

"In his experiments, M. Vrasski had followed the counsels given in French and German works on pisciculture; but the results obtained were far from being brilliant. In reality he obtained at each hatching but an insignificant number. 'From many thousands of eggs,' said he in one of his letters, 'there were only some dozens of young fry. The rest of the eggs were spoiled and lost for want of having been impregnated. I have, however, observed with scrupulous exactness all the directions given by the manuals with a view to fecundation.'

In the autumn of 1856, M. Vrasski was occupied with the microscopic study of the eggs and milt, and kept a journal in which he registered the least circumstances and incidents relative to each fecundation that he effected. Two months of persistent efforts brought the desired results. The journal and the microscope proved to him that the cause of

his failure proceeded precisely from the exact observation of all the counsels of the foreign manuals. It is necessary for fecundation that the spermatozoa of the milt of the male should penetrate the eggs of the female. In order to do this, the manuals recommended receiving the eggs in a vessel of water; afterwards, to receive in another vessel of water the milt of the male; and lastly, to turn the diluted milt on to the eggs. By his journal, kept with scrupulous exactness, M. Vrasski convinced himself that the fecundation was so much the less complete according as the mixture of the milt and the eggs had been most delayed. If ten minutes elapsed between obtaining the milt and the mixing of it with the eggs, the fecundation failed almost entirely. His observations and the microscopic researches of the eggs and the milt showed that first, when received in water at the instant of issuing from the fish, the eggs absorb the water and preserve the power of being impregnated only as long as this absorption is not finished; that is to say, during a half hour at the utmost. Once saturated with water, the eggs do not absorb any spermatozoa; but if received into dry vessels on issuing from the fish, the eggs remain, on the contrary, for a sufficient time in a neutral state, and do not lose the power, when once put into water, of receiving the spermatozoa.

Second, the spermatozoa of the milt, in falling into the water, commence immediately, with much vigor and rapidity, to make movements, which only last, however, for a minute and a half, or two at the most; when this time is elapsed, only in some few spermatozoa can there be seen particular movements and agonised convulsions. When at the issuing from the male fish, the milt is received in a dry vessel, it does not change for many hours, and during this interval the spermatozoa do not lose the power of beginning to move when they find themselves in contact with water. Closed in a dry tube and well corked, the milt preserved its impregnating virtue during six days.

From these observations, as also from the fact that the eggs, as well as the milt, are obtained slowly, their entire mass not being able to issue at once, M. Vrasski arrived at the conclusion that when they were received in water the greater part of the eggs attempted to saturate themselves with water, and the spermatozoa almost ceased to move before it was possible for the fish breeder to mix the eggs with the diluted water. M. Vrasski adopted then the system of dry vessels, and turned the milt on the eggs immediately he put them in water.

The success was complete; all the eggs were impregnated without one exception."

It is very evident that if those French and German manuals that M. Vrasski consulted are the best authorities that the student of pisciculture can obtain in those countries, that it is time they were revised.

Taking spawn and milt in different vessels, diluting them with water and mixing! and even after standing in water separate for a space of ten minutes they failed to impregnate! ! he evidently would not be called an expert operator, and probably is not now if he still says "the eggs and milt are obtained slowly," but he certainly deserves much credit for his perseverance to final success under such bad teaching. From his experiments it is shown that the egg is capable of being impregnated for about half an hour after being taken from the fish, while the milt will lose its vitality in about two minutes; therefore, those who practice this method should be able to strip a hundred or more female fish, and getting a water pail full of eggs proceed to impregnate them by wholesale with a few males. They claim that it does not hurt the eggs to fall like peas into a dry pan, and perhaps it does not, but how about sudden changes of temperature, such as will generally occur under such circumstances?

In a hatching house where a fire can be had, if required, there is little danger; but there are often circumstances under which such a luxury cannot be obtained, as, for instance, when spawning wild fish from a stream.

I do not hesitate to say that if I were taking spawn by hand I would not use the dry or Russian method, as it is sometimes called, for I have never liked it; it seems like crowding nature too hard; and as for its boasted advantages of time saved, and eggs impregnated, I doubt if they can be demonstrated by actual experiment, to be superior to the use of a little water.

All that has been written, as far as my observation has extended, has extolled the wonderful new method of impregnation; but I know some of the very best operators who take large quantities of spawn by hand, use water still. I regard it as a natural reaction of those referred to as "drowning their milt," from one extreme to the other. Take water enough in the pan to cover the eggs; strip a female or two and then a good male; give the pan a tip to thoroughly mix the milt and water; and if your ingredients are good, that is fully ripe and properly handled, you will find the impregnation good.

There may emergencies arise, as, for instance, if milt is plentiful to-day and may possibly be scarce to-morrow, it could be kept alive with its vitality unimpaired until required; as to the exact length of time that it can be so kept, authorities differ—some claiming five and others ten days; temperature undoubtedly has more or less influence upon its keeping qualities, which point might possibly be found midway between the extremes of heat and cold that it can endure alive.

That milt can be sent in a vial by mail or express without injury to the zoöperms from concussions likely to be received, has been suggested; but I do not remember to have seen any account of its being done, and so brought to the test of actual experiment; and if any trout-breeder

wishes to try it, I will gladly exchange a vial with him, and we will count the eggs, place them by themselves and note the exact percentage of impregnation; then, if we succeed, we will have demonstrated what is at present but theory. The milt can be taken in a homeopathic vial, which can be securely packed in cotton in a small box, or block of wood and sent by mail, with the day and hour of its taking carefully noted, as well as the exact time of its introduction to the eggs.

In regard to the proper kind of pan for impregnating, I know of nothing better than tin; last summer, at the shad-hatching grounds on the Hudson, Seth Green sent for trial some of the new paper pans, which are yellow or coated with some yellow varnish. This was before I joined the party, as they were banished after a trial or two. Mr. Monroe A. Green, who was in command, declared that they killed the spawn, whereupon he got out his tin ones that he knew were reliable. The same authority condemns galvanised iron, both for spawn and young fish; yet there are some who make transporting tanks of it. I give this to show how opinions vary, but never having had any experience with anything but tin, which is good, I cannot speak authoritatively.

FRED. MATHER.

The Kennel.

DISTEMPER IN DOGS.

IT is generally supposed that this calamity was first introduced into this country from France. It is the great scourge of the canine race, and very few dogs escape it altogether. The best preventive that we know of is to avoid anything that will produce debility, or low poor diet, exposure to cold, wet and damp sleeping kennels.

Mr. Vyner, a very clever and practical writer on this subject says: Be beforehand with the disease if you can, and upon the first symptom, which is a dry cough or husk attended with a loss of appetite and lassitude, give the following pills, to a small dog one pill, but to a large dog two pills. Always remember there is a vast difference between a terrier and a hound. Each pill should contain of calomel three grains, compound powder of antimony, four grains, camphor half a drachm. Give one at daylight and tie the dog's head up for three hours, if he is strong enough to stand so long, if he is weak he must be watched by a trusty person to see if he throws off his pill, and if he does he must have another. Work this off in four or five hours with a dose of castor oil. If the dog is much purged omit the pill and oil for one night, and then dose again as before.

Keep on with this remedy till a change takes place for the better, such as absence of fever and increased strength, but do not weaken him with too strong purges. The dog must be fed from the beginning, if he refuses his food, with a spoon on the best beef or mutton broth, with a little bread crumbled into it, or he will become so weak that he will die of exhaustion. This must be done every two or three hours or he will die. He must be kept cool (not cold) dry, sheltered and comfortable, with plenty of ventilation. If his eyes are much affected, put a seton in the back of his neck. If too much purged feed also on arrow-root or flour porridge, and if he is very ill with a violent diarrhoea, give him an ounce of balm or yeast, but if taken in time he will not want it.

If with the above treatment, with strict attention to feeding the dog well upon good light, but nourishing and wholesome food, and at the same time keeping cool and dry, if he does not recover I fear in vain must his owner seek otherwise for relief. Many young hounds die of absolute exhaustion, after the worst stages of the disease are passed from cruel neglect and idleness, when a little attention to merely giving them nutritious food and strengthening medicine might undoubtedly have saved their lives. The following pill given to puppies recovering from distemper, and also to older dogs which have been debilitated in their constitution I have frequently found to have the very best effect. Take of quinine twenty-four grains, gentian powder half ounce, bark powder half ounce, cinnamon powders one and a half drachm, sulphuric acid eight drops, one to be given every morning."

—Mr. R. C. F. of Baltimore, writes to us asking whether the progeny of an ordinary bred, but thoroughly broken dog is better than the progeny of a thorough bred entirely unbroken dog? Answer. The puppies of an ordinary bred but thoroughly broken dog, would inherit ordinary breed, and give extra trouble, care, pains and expense to break and train them. Then you would only have a breed of third-class dogs. While the progeny of a thorough bred entirely unbroken dog, would at least inherit a thorough breed, and therefore the whelps would require scarcely any breaking or training especially if they were taken out in the field along with their mother. Then you would have a first-class breed of dogs. The natural instinct of the dog, that is to say (we are assuming them to be pointers or setters) is to stand rigid in position on the scent of game birds, is handed down from generation to generation. The breaking, training, ranging, is more or less taught after the puppies have attained the age of maturity, and lies dormant to a great extent, until the instinct is exercised and educated by the dog trainer.

NOTICE.—Owing to the holidays there has been some little delay in preparing the Portrait of the English Champion Pointer "Belle." We will send it as soon as it is perfected.

For Forest and Stream.

TROUT FISHING.

BY MRS. EUNICE B. LAMBERTON.

GIVE me a rod of the split bamboo,
A rainy day and a fly or two,
A mountain stream where the eddies play,
And mists hang low o'er the winding way.

Give me a haunt by the purling brook,
A hidden spot in a mossy nook,
No sound save hum of the drowsy bee,
Or lone bird's tap on the hollow tree.

The world may roll with its busy throng
And phantom scenes, on its way along;
It's stocks may rise, or it's stocks may fall—
Ah! what care I for its baubles all?

I cast my fly o'er the troubled rill,
Luring the beauties by magic skill,
With mind at rest and a heart at ease,
And drink delight from the balmy breeze.

As lusty trout to my glad surprise,
Speckled and bright, on the crest arise,
Then plash and plunge in a dazzling whirl,
Hope springs anew as the wavelets curl.

Gracefully swinging from left to right,
Action so gentle, motion so slight,
Tempting, enticing, on craft intent,
Till yielding tip by the game is bent.

Drawing in slowly, then letting go
Under the ripples where mosses grow,
Doubting my fortune, lost in a dream,
Blessing the land of Forest and Stream.

Rochester, N. Y., Dec. 15, 1873.

From the Evening Post, 1872.

NEW YEAR'S CALLS.

AFTER MARCO BOZARIS.—A long time.

IT WAS New Year's, near the hour of noon
As through Fifth avenue there passed
Two youths, with hearts in sweet atune,
Through snow-vreaths trudging fast;
And all along the street they glanced,
With eager eyes that fairly danced,
At every door-plate's gleam;
Then up the mansion's steep ascent,
A nervous knock, and in they went,
With hat in hand and body bent,
To maidens' dazzling beam.

An hour passed on—yet still intent,
These gallant youths on conquests rare!
From house to house they madly went,
To seek the treasures hidden there.
But now no more with blithesome tread,
No more, alas! with steady head,
As in the early morn;
For many cups they'd fully drained,
Not once from brandy punch refrained,
And now with stomachs overstrained,
Their wits were nearly gone.

With reckless gait and hats awry,
Another house they soon essayed,
Yet paused to ask a passer by
If here was where Miss (sic)—son staid.
Then up the steps they wildly reeled,
Jerked off the bell and in they wheeled—
Wheeled and gave the maid a hug,
Tripped their toes against the rug;
Sat on their hats, and with a smile,
Drank to their hostess' health the while,
In muddled undertone:
"Drink, ye beauteous (sic) lasses all;
Drink, to our mer (sic) New Year's call;
Drink, until we stand or fall,
Or else we drink alone."

They drank like toppers, long and well,
They drained their goblets to the brim,
They drank, until at length they fell,
Trembling in every limb—
Yet once again upon their pins,
They shuffled on their toilsome way,
While brandy punches, wines and gins
Poured down their throats till close of day.
Long scrambled they from door to door,
By helping hand or friendly push,
And when their strength could do no more,
Sat down among the slush!
Their few surviving comrades saw
Their plight, when rang their last hurrah
At midnight's silent hour;
Then saw their heavy eyelids close,
Then helpless sink in calm repose,
Safe in policeman's power.

CHARLES HALLOOK.

ASPIRATION.

I'VE seen a bird, while its way upward making,
Struck by the hunter in some vital part,
Gather and spread its wings, still higher dart
With last fond breath,
As if the slender thread of life in breaking,
But gave fresh impetus to strong desire,
Impelling it toward where it would aspire,
'Mid throes of death.

Thusto a worthy goal may I be tending,
With single purpose and unerring aim,
Toiling and striving upward to the same
With all my might.
And when Death's, the great archer's, shaft ascending,
Pierces my vitals, and my task is o'er,
With powers increased, may I still higher soar,
As fades my sight.

New Orleans.

JAMES RUNNEGA.

—The collie dog, which in the control of flocks and herds displays an instinct more efficacious than human reason, is admirably described by Burns:

"—a gash an' faithful tyke,
As ever lap a sheugh or dyke
His honest, sonie, baws'nt face,
Aye gat him friends in like place.
His breast was white, his towzie back
We'el clad wi' coat of glossy black;
His gawcie tail, wi' upward curl,
Hung o'er his hurdies wi' a swarl!"

HADDOCK FISHERIES OF NORDERNEY.

EDITOR FOREST AND STREAM:—

What the cod is to the inhabitants of North America and the dorsch to the Scandinavian populations, the haddock is to the nations bordering on the northern waters of Europe, and is, next to the herring, the most important and valuable sea fish. It is true the haddock has not yet reached an equal point of importance in national economy, owing to the fact that it never appears in as large schools as the cod or herring. The Scotch, however, some years since, have introduced the haddock as a permanent article of food by bringing into the market their "smoked haddock," and the day is not distant when in that form the haddock will become a permanent and welcome addition to the food of northern Europe.

The most prolific region for this sea-fish on the north German coast is off the Island of Norderney, one of those islands extending in a long chain on that coast. These islands form a land-locked channel with the main, safe for the smallest craft, and allow that local traffic along the borders which has given rise to the development of a great many industries, the principal one of which is the haddock fishery of Norderney. In this sketch we shall frequently make use of the important material found in Dr. Kohl's "Nordwest Deutsche Skizzen," published in Bremen in 1873.

The haddock is ever seeking the cold water; hence we find it on the coasts of Norway throughout the entire year. In the German sea, near Helgoland and Norderney, as well as on the Scottish coasts, the haddock generally appear as late as the end of September, and off the German coast, from that time to Christmas the fishermen go out; about this time it ceases, owing to the cold, ice and storms, and begins again at the end of February or the beginning of March. On the Scotch coast, where the ice cannot heap up, as on the north German sand banks and flats, the fisheries are prosecuted throughout the entire winter. In May and June the haddock leave the German coast for the colder regions to the north.

Norderney being, with the exception of Helgoland, the most populous of this series of islands, possesses the strongest fishing squadron; but its preëminence is mainly due to the presence of a peculiar worm, abundantly found in the sand banks; and which has proved the most enticing bait to the haddock. This worm is called the "pierer," and is as long and thick as the little finger. It lives and delves unceasingly in the sands, from one half to one foot below the surface. It swallows the sand grains, and its stomach is always filled with them; but after having by this means assimilated the digestible vegetable and animal substances, the sand grains are discharged. This worm is too perishable to be transported to other islands. In Helgoland, the fishermen use the intestines of the seal brought from Greenland by the whale fishers; also certain parts of the intestines of the whale itself. In default of either, *ox-liver* is used, but only of necessity. The "pierer," however, is unsurpassed as a bait, as has been proven by numerous trials.

It is a clear day in September, and the sun's disc is slowly rising from the eastern waters, gradually dissipating the mist which hangs along the horizon. The evening before the last touch has been put to the fishing tackle. The boats are bright and smart, ready for work; every one in the coast village is eager in the expectation. In the minds of all, men, women and children, a certain restlessness is mingled with the sense of there being nothing to do just then but to wait. A few fine fellows as an advance guard are pushing with their craft out to sea, ready for the work which is to provide the islanders with food and raiment for one whole year. They drift out to sea; cast their lines; bait for a couple of hours. Not a line stirs; the shoal of expected fish has not come yet. On shore everybody eagerly watches their return. A week may have gone by, when suddenly the cry will resound on shore throughout the fisher-huts, "the haddock have come!"

The scene now changes to immediate and stirring bustle. It is the province of the women to procure the now necessary bait, the "pierer," while the men and older boys are getting the boats ready for sea. Armed with a fork not unlike the American forked spade, and very like Neptune's trident, and provided with shallow vessels, the women and girls scatter along the flats and begin digging for worms. This work must be done quickly; must be accomplished during the shortest period of the lowest ebb, when the flat is clear of water. And since, oftentimes, a flotilla of from forty to fifty sail is waiting to be thus supplied, and each boat will need about three thousand worms for one trip, one hundred and fifty thousand worms have to be procured in all.

The fishing tackle of the Norderneyers is, in their local idiom, termed "want." It consists of, first and principally, a strong and thick rope, to which are fastened at certain distances thin lines, on which are attached their fishing hooks, plated with tin. The principal rope is called the "lienne," the line; and the smaller lines the "schnor." These attached lines are each about six fathoms long, this being the depth at which the haddock will bite, namely, close to the bottom of the sea. The divisions on the principal line are marked by the fishermen with great exactness; they are one fathom apart from each other; the principal lines being eighty fathoms in length; hence, provided with eighty hooks each, four lines with three hundred and twenty hooks, make a "back," or a pack of lines. Every vessel will take ten "backs" on board. During their summer and winter rests, the fishermen carefully mend, renew

and make additional fishing tackle. The most delicate part of the operation is the fastening of the hooks. Each hook is tied with a tarred thread to the lines. To keep each piece from being entangled in the numerous hooks, the hooks are strung upon a piece of wood until the line is to be used. Finally, buoys are fastened to each principal line to indicate the spot where the lesser lines have entered the water.

The German ocean's bottom being everywhere level, sandy and without natural obstructions, the fishing tackle is less exposed to destruction than on the rocky coasts of Norderney or of Scotland. Still, they are exposed to various accidents, such as of sunken vessels, and the fishing tackle is not unfrequently seriously injured. Sometimes an enormous ray will have to be hauled up; and a few years ago, what rarely happens in these waters, a shark measuring seventeen feet in length was thus captured.

The same kind of fishing tackle is used on the north German coast, but the Dutch fishermen throw out nets to take the haddock. This fish is, however, taken in but very small numbers in Dutch waters. The Scotch declare that they would be unable to catch a single haddock with the German fishing tackle. Thus every nation concerned has its peculiar customs, and it is a curious question whether the haddock, having been taken in a manner peculiar to a coast from time immemorial, might not refuse to be taken in any other manner. It is evident that the German method is the better one. In the German way the fish dies rapidly; in the other the death is made slower and not conducive to the preservation of its flavor.

Great care is required even after the fish is killed to preserve this desirable quality. The fish must be handled as little as possible. The German fishermen maintain that the haddock must be brought to market with its natural slimy coat on. Hence they do not clean the fishes on board of the vessels, but leave this manipulation to the Bremen or Hamburg cooks.

In stormy weather the haddocks appear in greatest number on the Norderney and Helgoland coasts. The best time for work is, therefore, shortly after a storm, when the fish will bite most eagerly. Then a little sloop will bring in probably two thousand fish, valued in market at two hundred dollars. Sometimes, if wind and weather are extraordinarily favorable, the sloop will sail out twice in twenty-four hours, bringing in two harvest in a single day. The trip does not usually extend farther than eight or ten miles out to sea; sometimes the boats venture out to fifty or sixty miles distance. The fishermen when questioned will laugh at any supposed danger at first, but after closer inquiry admit that now and then a mishap befalls them, and some catastrophes are on record. Thus, some fifteen years ago, the flotilla went merrily out to sea from Norderney. It was a most delightful day; but a terrific storm overtook the frail smacks on the high seas, and out of sixty, seventeen of these small vessels were swallowed up by waves, making at one blow widows and orphans in thirty families. It is remarkable that although these islanders live on the sea, but few of them know how to swim, and have a very low opinion of the efficacy of that art, considering it perfectly useless. They believe that if God wills that a fisherman must die by drowning no amount of swimming could possibly avert this fate.

When the sloops are filled with haddock they hasten back to the village, in order to expedite the sloop's return for another trip. Women and girls await the arrival of the vessel to receive the tackle. Each sloop being the property of one family, and no family counting more than four grown women in the household at the utmost. Every woman will be presently seen loaded with three "backs," returning through the slippery flats to the village, carrying some one hundred and eighty to two hundred pounds weight, which gives us no mean idea of their power and endurance.

Sometimes the fish are sold to the Scotch buyers coming to Norderney during the season, but generally the sloops run into the mouths of the Ems, Ebbe, Werer, Jade, and the Holstein rivers, to the market, the cities being at the head of steam navigation. The precise harbor to be selected is scarcely ever known beforehand, and is determined on the trip, as it must depend upon various circumstances. If many competitors turn into the Weser, one patrol will go to Hamburg or somewhere else. Since the completion of the Ems railway the harbor of Emden has become the great haddock distributing mart for northwestern Germany. The Ems river during adverse winds can be entered readily, and ere the fishing neighbor from Norderney has reached Hamburg or Bremen, he who has put his eye on Emden first has often the satisfaction to be already on his homeward trip with the bright dollars in his pocket, the finest of his cargo being on its way, well packed in ice, going to Berlin or to Vienna to grace some patrician's dinner table. Railways have brought about a very great revolution in the haddock fisheries of the north German Islands. Everything must be done promptly and quickly, owing to the greatly increased consumption and consequent competition. The great question at the opening of the season with the haddock fishermen is who shall first get his cargo into Emden, Hamburg, Bremen or Husum, as it is with us here who shall ship to the great markets of the North the first strawberries or peaches. The native shrewdness in trade of these fishermen of Norderney is thus put to the highest test, and the most remarkable examples of statcraft and duplicity will then occur.

The perishable nature of the fish requiring prompt action, as soon as the sloops heave to at Bremen or Emden, officials especially appointed will cry out through the streets again,

"the haddock fishers have come;" as upon the appearance on their coast the fish itself was hailed by the fishermen. There is always a demand for haddock, and if the demand should at any time be slack, the fish are sold for what they will fetch, and then the poorer classes of the population have their day. Generally the Norderney fishermen drive a pretty good trade. Soon the tidy female cooks of Bremen and of Hamburg, will, basket on arm, grotes and shillings in apron pocket, besiege the sloops. The captain, with immovable stolidity, will insist upon his own price and withstand all female blandishments for a reduction, until mutually tired out, the cooks pretend to go away to another sloop, "the captain of which will be more accommodating." The fisherman lowers his price one grote, and the cook grows more tractable, and is willing to give half a grote more. Then the bargain is struck to their mutual satisfaction, and the haddock is carried home in triumph to the kitchen. F. S.

RAIL SHOOTING ON THE DELAWARE.

EDITOR FOREST AND STREAM:—

Rail shooting is a sport enjoyed almost exclusively by Philadelphians; certainly in no other city is it followed so regularly, and with so much zest. The season occurs between times, as it were, and after the two long summer months of July and August, when there has been little or no shooting, there is no wonder September 1st is hailed with delight by the sportsman.

The numerous flats and islands in the Delaware River at this season of the year are covered with a dense growth of wild oats, or reed, as it is commonly called, shooting up from the oozy bottom, alternately bare and flooded with water three or four feet at each succeeding rise and fall of the tide. As the reed begins to ripen about the middle or latter part of August, the rail arrives and soon becomes very fat, the wild oats imparting to them a delicious flavor when served for the table. Countless numbers of reed, or rice birds, flock to the same feeding ground, and, although not proper game, are much persecuted, more on account of the dainty dish they offer than the pleasure they afford in shooting.

Several varieties of the rail are killed on the Delaware; by far the most common is the *Rallus Carolinus*, or sora. The *Rallus Virginianus*, or red rail, a few years ago was more frequently met with than latterly, and I may say that where fifty soras are killed but one or two red rails are boated. The *Rallus Elegans*, or king rail, is comparatively rare, but at times shot, and the *Rallus Crepitans*, clapper rail, or mud hen, so far leaves his home of the salt meadows as to sometimes fall a victim to his wanderings. The common coot, likewise of the same family of *Rallide*, or rail, may be considered a rare bird with us also; the writer, however, killed three of them while shooting sora the past October.

In speaking of the *Fulica Nigra*, or common American coot, closely allied to the rail, I do not wish it to be confounded with the *Fuligula Americana*, or American scoter, a duck, vulgarly called a "coot" by some sportsmen and all baymen.

At most, rail shooting does not last longer than three hours during a day, and much depends upon the extent of the tide, and indeed a great deal on the wind and moon, for it is well known that a full moon, occurring during the prevalence of a northeasterly or southeasterly wind will bring in "a high water," which is most favorable for rail shooting. The more tide the most rail always.

I have seen the water in the Delaware River, at the "top of the flood," so low that one could scarcely be pushed more than a rod on the flats, this having been occasioned by the wind blowing from the northwest for the two previous days. An afternoon tide is always the highest, and the sportsman posting himself as regards its state can jump into the cars, and within an hour's time will reach either the Lazaretto, Chester, or Marcus Hook, the three best points on the river. At the Lazaretto (and this place I prefer to either of the others) good pushers can be had, and I will venture the Wood brothers, Dick Milt and Bill, Ben Badger and John Brown the best of all, especially as to marking and endurance. At Chester the greater portion of the men who follow pushing in September are of the "dark persuasion," and therefore not so companionable; nevertheless, there are many good ones among them, and one cannot go astray in engaging Sam or Dick Brown, Sam Preston, or Bill Rump, the son of old Bill, long noted for his prowess with the push pole. I should say that Pete Goff is about the only white pusher I would hire at Chester. At Marcus Hook the three Haycocks are fine men; these are about all I know at "the Hook." I seldom visit it, and do not fancy it much, as the ground is too limited. I have mentioned the names of pushers for the benefit of sportsmen of other cities wishing to enjoy the sport, that they may engage by letter to Goff's or Klutz's Hotel, at Chester, or to Graysberry or Wells at the Lazaretto. I will say that to reach the latter place, Moore's station, on the Philadelphia and Darby branch of the Baltimore and Wilmington Railroad, is the place to get off, where Wells or Graysberry will be on hand with a team if advised beforehand.

And now to the *modus operandi* of rail shooting. Fully equipped, with plenty of ammunition—one hundred and fifty rounds at least—it is best to have enough, and not run short, as I did on one occasion, contenting myself with "low boat" while my companions were knocking the birds right and left around me). Your pusher will row you I will say from the landing at the Lazaretto, two or three hours before high water, to the upper end of Tinnicum Island, in the centre of the river, where, if the tide is to

be a high one, the water will allow the boat to be pushed first on to a flat on the Jersey shore called "Clemmel," which, I think, is the lowest on the Delaware. Standing a little forward of amidships you brace yourself while your attendant on the decked end of his clinker built skiff begins his work; and it is work, this pushing without cessation of man and boat through masses of standing reed for two or three hours. As the skiff is propelled, the rail, forced to fly by the rising tide and the quick approach of the shooter, presents an easy and simple mark, the poleman attracting the sportsman's attention by a "mark right" or "mark left," as the direction may be, the recovering being the most difficult, owing to the great sameness of the surrounding reed. But such is the skill of these pushers that I have known five birds to have been killed before one was boated, and all were recovered. Seldom, if ever, is a dead rail lost by any of these men.

Shifting to grounds that allow the egress of the boat at a later state of the tide the sport is continued, and shot after shot is had in quick succession, each pusher striving to outdo his fellows, until the ebb drives the shooter from the flats to count his head of birds, and to learn who the lucky "high boat" is, for be it known a great honor is attached to the gun and to the pusher of the fortunate skiff.

Frequently one hundred rail are killed during a tide. Sometimes one hundred and twenty, and never less than fifty, if there is any water at all. It is common while being pushed through the weeds to have shots at teal and larger ducks as they jump from some ditch or pool on the flats, and it is best always to have a spare gun with No. 5 or 6 shot for them. As for rail, we use Nos. 9 and 10. A breech-loading gun is invaluable for rail shooting, and the "high boat" is generally found to be the possessor of one of these improved arms. Last season rail were unusually plenty, and shooting lasted well into the latter part of October, but we had very few very high tides, one hundred and seven rail being the greatest number of birds shot in a single day.

It has often appeared strange to me that our New York friends do not pay us a visit during the rail season and try one or two days of it. By taking the through Washington train in the afternoon from Gotham they can be landed at Chester before midnight, and by looking at any Philadelphia paper can learn at what time it will be high water on the days they wish to shoot, always rating the tide forty minutes earlier at Lazaretto than at the navy yard at Philadelphia, where the record is made. A letter to Klutz or Goff, Wells or Graysberry, will engage a pusher, and I will warrant a good time and plenty of it.

English snipe shooting at these points and at this season can be had, and one can alternate his sport by taking one day with the rail and the next with the snipe.

May our brother sportsmen of New York visit us next September is our wish, and may they be "high boat."

"Homo."

CARIBOO HUNTING.

QUEBEC, Dec. 15th.

EDITOR FOREST AND STREAM:—

Possibly a few lines on our great fall sport, Cariboo hunting round Quebec, may not be unacceptable to your readers. Fortunately the early introduction of the game act prevented the extinction of our noblest game, though the law came too late to save that lordly king of our forests, the Wapiti. He has disappeared, I fear for ever. But the barren districts in rear of St. Paul Bay, on the lower St. Lawrence are yet the resort of cariboo, (the Woodland Cariboo) in large droves is sometimes as many as five hundred together. Our hunting parties generally leave the city with the first good snow roads, about the 25th November, in order to be back and eat their Christmas dinner at home, when the traditional fat goose is supplimented with a haunch of juicy venison with apple sauce.

I can give the results of only one hunting party yet, the others being still on the war path: thus Messrs. J. S. Budden, J. Gibb, and M. Molson, are still in the wilderness, as well as Charles V. Temple Esq., of the Highlands, Sillery. The party just returned was composed of Col. D. C. Thomson, and Mr. McNaughton, both of Quebec, the Hon. Hugh Elliott, son of the Earl of Minto, of Roxburyshire, Scotland, and Mr. Pratt, a sporting gentlemen from Norfolk, England. They left on the 26th November, drove down to St. Urbain, in winter vehicles, over the rugged north shore mountains a distance of about seventy miles. The recent thaw and rain which set in cut short their operations, and the frost which followed by rendering the snow hard and brittle prevented the noiseless and stealthy approach of the game. They had but one really favorable day to hunt, and bagged six cariboo, wounding two others which got away. Col. Thomson used the Spencer cabine and the English gentlemen the Martin Henry.

The cariboo still resort in large droves to feed on the white moss which clothes most luxuriantly the extensive moors in rear of Bay St. Paul, called *Les Jardins*, and bears are frequently met, attracted by a small red berry, which grows on low shrubs much like the low-bush cranberry, and whole moors are studded with this fruit, called by the Indians *Des Grains*. From St. Urbain the trip is made on snow shoes. The guides are harnessed to the wagons laden with provisions, ammunition and camp utensils, and away you go for twenty or thirty miles on foot, over the most mountainous, but picturesque portion of the Laurentine chain, amidst some of the wildest and most lovely scenery on the continent. From the top of the *Montagne quarrée*, the eye in the bright morning sun, takes in snow lakes, its valleys and gorges and several other trout lakes,

sleeping in their northern solitude, with no other sound but the hoarse croack of the raven. Col. Thomson reports the Wolverine (Carcajou or Indian Devil) in extraordinary abundance and so destructive to the game, that the trappers meditate using strychnine to poison him. This animal, the *Gulo luscus* of naturalists, is indeed an odious pest.

There is no kind of mischief he has not a paw in, from robbing a beaver dam of its inmates, to stealing the mink and marten from the traps. His powerful claws and strength make him a match for any dog. Polenok, the colonel's guide, tells of an encounter he witnessed between a good sized dog and a *Carcajou*. The Wolverine having seized hold of the dog by the neck, stood up on his hind legs and set to wrestle with him, holding him tight. Canis howled with rage in the grasp of his tormentor, when on the master going up to the scene the wolvreine scampered off evidently pleased with the joke.

Last season an old Nimrod wished to initiate a verdant Englishman in one of the peculiarities of the Canadian porcupine. It so happened that the very next day the guide brought in what he styled an unknown beast. Though it did not seem very heavy, its weight was made the subject of a bet, as to whether the Englishman could walk down to the camp with such a weight on his shoulders, on snow shoes. After half an hour's trudging along, John Bull complained of a prickly sensation, which he felt through to his chamois coat, and on arriving at the camp he found the flesh of his back was quite raw, the quills had pierced through the bag containing the animal, the leather and under-garments as well. John Bull had found out one of the peculiarities of a dead Canadian porcupine.

Cariboo hunting in winter is a great institution with our Quebec sportsmen, it is the sovereign remedy to dispepsia and disorder from the liver. But enough for to-day, Mr. Editor, I feel I have even encroached more than I thought on your valuable space.

Yours truly,

J. M. LEMOINE.

OCTOBER IN THE ADIRONDACKS.

IT was about six o'clock on a beautiful morning in October when we started from Martin's Hotel, Lower Saranac Lake, for a day's hunt. We had a row of eight miles to get to our hunting ground; hence our early start. The sun soon appeared from behind the mountains, and with their snowy caps they sparkled like diamonds. The country far and wide was covered with a veil of snow, and the view from our boat, as it wended its way through the islands of the Saranac, was one of surpassing loveliness.

After travelling for about four miles on the lake, we entered the Saranac river, and passed rapidly down on its smooth bosom for about two miles. Its sides are lined with lofty pines, and as we passed on we would now and then catch a glimpse of the Adirondack range, Mt. Marcy, Whiteface, Seward and all the lesser heights, and close to our right Ampersand, with its single pine on the top. After a while we reached a place where a broad footpath led from the shore, and having disembarked, we followed this through the woods until we came to a group of five tents; this was to be our home for a few days; so we left our equipments in one of the tents, and then returned to the boats. The starter, with six trusty hounds at his belt, now went off into the woods. We kept on in our boats for about a mile, where we separated for our stations. As I was nothing but a boy, my place came about number five in point of excellence, there being four older ones in the party. But luck happened that day on my side, as will be seen. My guide and I watched on a narrow strip of land extending into a large pond. He ascended a tall tree, which had the limbs trimmed, and from its top kept a sharp lookout. We had watched for about two hours, when I heard in the distance that sweet music to the hunter's ear the bay of a hound; nearer it came until it seemed as if the deer were coming directly to us; but no, they swerved to the side, and we heard them going through the woods about a quarter of a mile off. Then the hound ceased barking and we knew the deer must have taken to the water. It was not long before my guide jumped hurriedly down from the tree and told me there was a big buck over in the pond. We jumped into the boat, and in our hurry to get to open water nearly smashed several trees that were floating near the shore. We had rowed for about half a mile, when we saw the deer swimming with all his might for a marsh that bordered the shore; the water was about three feet deep over this, and it was covered with tall grass that would effectually conceal him; hence we were afraid we would lose him if we did not head him off; but he was too much for us, and just as we came up he entered the marsh, not, however, without my sending a compliment in the way of six buck shot. There was a little open water between the marsh and the shore, and we knew that if we got in there we would cut him off from the shore. Around we went, the perspiration streaming off of us, but no deer could we see. We concluded he was still in the marsh, so we shoved the boat in and through it, hoping to start him. We had gone over nearly all of it, when suddenly my guide exclaimed, "there he goes;" but we saw, too late, his head disappear behind the tall grass. Back into the open water, and around we go; but he spies us, and takes to the marsh again. My guide sent a bullet after him but to no effect. We pushed the boat in where he went in, and soon I saw his head disappear again behind the tall grass; but this time he rose again, and leaped high in air; my left barrel poured its contents into his head; a splash followed and I knew I had hit him. Sure enough, we found the

noble fellow perfectly dead, with seven buck shot in him. We lifted him in the boat and returned to our watch ground in high spirits. We took our station again, but we heard nothing for the remainder of the day, except some guns in the distance, telling of luck for others of the party, until about five o'clock. Just as we were about to unchain the boat for our return, we heard a crash in some bushes near the shore, and out rushed a fine doe; she leaped high in air, and while yet she was above the water my gun covered her neck; a report, and the deer lay motionless on its surface. All this had been done in so short a time that I had not been excited, but now that my second deer lay before me, I confess that I was excited. We now had two deer to carry instead of one, and it was after dark ere we reached the camp. To the limbs of a tree near the camp hung two other deer killed by the party. Considering the scarcity of deer there, ours was good luck. A huge fire blazed in the middle of the circle of tents, and, lighting up the surrounding woods with its ruddy glare, and with tall pines all around, it was quite a romantic scene. After our day's work, our supper of newly killed venison was relished just as much as any sumptuously prepared dinner we had ever eaten at home, although served in little tin platters on the rough board table. The evening was spent in hearing the adventures of the guides, and many a joke those lively fellows got off. The hounds lay alongside the fire, and ever and anon one of them would bay in his sleep, going over the hunting scenes of the day; others filled the air with their snorings. One by one the tired hunters retired for the night, and silence reigned throughout the camp. About ten o'clock a blustering snow storm set in, which raged with unabated fury throughout the night; but rolled snugly in our blankets, we rested after the labors of the day.

CHARLES H. CROW.

HARE HUNTING.

WASHINGTON, D. C., December, 1873.

EDITOR FOREST AND STREAM:—

Fox hunting, as enjoyed in the early days of the Republic, is fast dying out. It is a rare instance to find any gentleman of the country who has his full pack of hounds, although many will relate with eye sparkling again with the fervor of youth, of the meet, the thoroughbred, the jumping chase o'er fence and ditch, the welkin ringing with the deep mouthed yelp, and successful ride in at the death. The most he can boast of present possession is two or three worthy descendants of former kennels, and the old horn of his fathers, whose stirring sounds have often awoke the echoes of his native hills and valleys. It is true that occasionally the united stock of a neighborhood are brought together, and the chase indulged in with some resemblance to the good old times, but the sport is rare and unsatisfactory. Small farms, with their frequent fences and cultivated lands, have been its greatest enemy, and the few remaining beagles are devoted exclusively to the less exciting sport of hare hunting. It is not to be contended that hare hunting is comparable with the pursuit of the fox. The timid little animal has not the fleetness, the endurance, or sagacity of the latter, and yet it has just sufficient of each of these qualities to resemble the more exciting sport without its nobility in taxing the best powers of horse and rider.

The frost is still fringing every leaflet and twig with its beautiful crystals, mingling with the russet brown of autumn into the softest grays as the undulating hills fade in the distance. Not far from the hospitable country mansion is a belt of pines, where the game is plentiful. The dogs know by instinct their duty. How different their movement from their brothers, the hunters of the field. The party of four or five—the more the better and merrier—spread out some hundred yards from each other. The dogs have silently penetrated the woods, each closely scenting the ground. Before many steps have been taken some one of the party has started a hare. Instantly, at the top of his voice, he whoops for the hounds, who come tearing in with a bounding gallop. The spot where the hare ran is shown them, with the old cry of "Hark away," and then such yelping, taken up as each strikes the trail, and at full speed they dash away. Stand still. He will be sure to make a circuit of the neighboring hill, when you may give him your fire as he bounds past you, if he shall have been fortunate enough to have escaped your comrades. What music, as the constant cry comes softened from the deep forest! Now farther, now nearer, now ceased with the loss of the trail, now wilder than before, when some old stager has caught again the warm scent. How the poor frightened creature stops, intently listens, and then wildly jumps from the ever approaching noise, seeking in turn the wild broom sage, the deep ravine, the thickest covert, and even swimming the rapid streams, in the false hope of eluding his pursuers. Be patient! Stand still! They will bring him around, although their yelping is but faintly heard. Yes, it grows nearer, and for a moment, affected with the enthusiasm of the pack, your heart beats a little faster. Hush! He comes; you can hear his footsteps over the dry leaves. A moment more and you see him jumping down the hillside with his large eyes larger still with fear. For an instant an undefined sense of compassion touches the outer boundary of your conscience. Alas, it has died before it was born, and a well directed aim turns the poor thing over. His chase is done. In come the dogs with full speed and cry. You show it to them and start for another. It is not long before they are off again, and the party at nightfall may be loaded down with some twenty or thirty. Sometimes an old fox, in his

nocturnal prowlings, has strayed across your path, and off they all go with full cry. The old love of their fathers has been awakened in them. The hunt of the day is over, and they will not return until they have tasted of his hide. This sport is of course very tame to the hunter of the moose or grizzly, where endurance and courage are eminently requisite, but to those who are compelled to hunt within bow shot of municipal limits or not at all, it is a good way to give your setters a day's rest in a week of quail shooting. The defence, however, of hare hunting must rest on the ground that in the hands of your artist-cook it can be made by no means an unpalatable dish. S. L. P.

HUNTING AT BLOOMING GROVE PARK.

BLOOMING GROVE PARK, PARK HOUSE, Dec. 20, 1873.

EDITOR FOREST AND STREAM:—

Our weather for the past week or more has been delightful, thermometer at 40° to 45°; the old snow passed away, but not the ice, under the genial warmth of the sun and showers, and a balminess of spring in the air. Yesterday a light snow fell, just enough for tracking, and here is a day "hard to be beat" for stalking, but alas! I am confined to the house with a bruised knee, unable to cope with rocks and tangled thicket, and the hills and valleys will not respond to-day with the crack of my Ballard of calibre 46. I can only sit in my sanctum, mourn over cruel disappointments, and murmur my complaints to the sympathising ear of the FOREST AND STREAM and its numerous readers, no less sympathetic. On Monday last I tried, for the first time this season, the fishing through the ice—and in company with F. W. Jones and Mr. J. E. McEwen of Brooklyn, took, in less than three hours' fishing from Beaver Lake—one of the numerous Lakes of the Blooming Grove Park—16 pickerel ranging from 3½, 3 and down to 1½ lbs. The ice we found to be about 10 inches in thickness, and just in prime condition. The early fishing is always the most satisfactory in its results. Lake Giles, the most crystal water and most beautiful in its surroundings, above which stands the "Club House," is always the last water to freeze of all the surrounding Lakes, being fed from springs in its bottom, and the ice is not yet in condition to bear the weight of a person, as I happen to be able to bear woeful testimony. The fish from this Lake are superior in size and quality, on account of its clear water and rocky bottom.

The Sheaffers', living near the Knob Mills, are the most indefatigable and successful hunters of this section, and two weeks ago, when I saw Jonas, had killed 14 deer and 3 bears, an old she bear and well-grown cub and a yearling. His description of his fight with the cub was quite graphic, and I will try and relate it. It seems that he, with his little dog, were doing the driving for deer, while the rest of the party stood upon runways. In skirting a dense laurel swamp, the little dog being in the swamp, commenced a furious barking, and, at one particular point. Supposing something unusual to be the cause he slowly and cautiously ventured in, and by degrees advanced to within ten feet of an aperture in some old roots and stones, at which his dog seemed to be stationed, and, emboldened by his approach, into which he would occasionally dive, only to recede with hair erect, and starting eyes and manifestations of greatest excitement. In these attacks he could plainly hear the gnashing of the old bear's teeth. At length having fully considered the matter and taken in the situation, he, as the dog withdrew from one of his rushes, and having his gun—a double rifle and shot—carefully aimed and the other barrel at full cock, fired into the opening, whence as the smoke cleared away rolled out a well-grown cub, which the dog at once clinched. He could not use his gun for fear of killing his dog, and in his excitement and the tumult of the fight between dog and cub, off went his remaining barrel, which deprived him of the use of that weapon in a legitimate way, but by dint of well-directed blows with the barrels and the assistance of his dog, he kept the cub at bay and from escaping into the laurels, while with lusty shouts he in time brought one of the others to his assistance, when they soon made an end of the little disturbance. On examining the hole, they found the old she bear lying dead within, the ball from his first shot having fortunately entered the brain and dropped her dead as she lay. Had he simply given her a wound in the random shot there might have been a different tale to relate. His remark, as he shook his head over the narrative regarding his canine, is worthy of record:—"That dog will ketch his death some of these days for his venturesomeness."

Respectfully,

A. F. CLAPP, Eng. & Supt. Park.

LIFE PROBLEMS.—Every full-grown adult person throws out by respiration about four-and-a-half gallons of deleterious gas and watery vapor per hour; and the children of school age average each one about three gallons per hour. Suspended in this deleterious respired air and vapor, there is in every 1,000 gallons, 3 gallons of dead, decomposing animal matter! In hospitals and bedrooms, other evaporations add to the mass. And in ferryboat cabins and city railroad cars, as ordinarily conducted, saliva and tobacco smoke add fifty per cent. Now, if one person throws out four-and-a-half gallons of poisonous air every hour, how long will it take 1,000 persons to fill a church full? 50 children to fill a school-room full? 40 persons a car full, or 200 persons a ferryboat cabin full, plus the tobacco-smoke and saliva?—*The Sanitarian.*

—They have Tandem clubs in Canada. Lieut. General Haley is the Prest. of the Halifax club. The other day it took a drive "up the road" and the turn-out comprised thirteen tandem teams, two doubles and four singles.

—As the English plum-pudding is made in a bag, there can be no doubt of it's Sacks-in origin.

Woodland, Lawn and Garden.

WINDOW OR PARLOR GARDENING.

NO. III.—BOX OR SIMPLE FORMS.

"Here are cool mosses deep,
And through the moss the ivy creeps,
And in the stream the long-leaved flowers weep,
And from the craggy ledge the poppy hangs in sleep.

The oxlips, pugles, with their numerous race,
A parti-colored tribe of various hue,
Red, yellow, purple, pale white, dusky blue,
The primrose, myrtle, and the crocus too.

WHATEVER leads us to assemble together the beauties of the floral kingdom as comforts and elegancies of life within the habitations of wealth, or of those of more moderate means, always increases local attachments and renders domestic life more delightful. It may seem a very little thing to place a flower in the window, but how much may come of it who can tell? A love of flowers has always a redeeming quality about it. You rarely hear of a very bad man who passionately loves the cultivation of flowers. God instituted the garden, and Lord Bacon truly says, "The Lord himself first planted a garden, and indeed it is the purest of human pleasures." As a penalty for his transgression, the first man was shut out from a habitation among the beautiful scenes of an earthly paradise. Yet all his descendants have for all time sought pleasure and delight from the first Eden, and a strong desire to return to it again seems to be deeply implanted in every heart. And when we remember how easily we can surround ourselves, even within the limits of the humblest home, with these bright and beautiful flowers of earth, we are truly surprised to behold any home without its blossoming rose tree or its box of sweet elysium.

In the progress of the art of growing choice flowers in the sitting room and the parlor we shall do well to keep in mind that however beautiful, however poetical are the many associations connected with them, there is a deep practical fact underlying this whole subject. And that is, how to successfully obtain, through our own efforts, all this beauty, this wealth of enjoyment.

In our second paper we gave to our readers some of the most simple forms for the foundation of a window garden. And we would again state that a simple flower stand near the window, a hanging basket suspended over the same, each growing their pendant, fragrant, and upright flowers, may be considered as the simplicity of our window garden. With all their elaborate adornments and additions of rare flowers, they all sprang from this simple first effort.

Said a lady to me:—"The successful cultivation of a cactus of this species, called the night-blooming cereus, gave to me a quickening impulse, a love for something more beautiful, and as I first started with the cactus I added one after another to my collection, and now I have made a sort of specialty of the cultivation of this very curious plant. Strange and grotesque are the forms which present themselves to the eye in my six feet by four window frame, yet all who behold it exclaim 'how beautiful! how wonderful! what a lesson for practice!'" The manner in which our lady friend had arranged her foreign cacti was truly very ingenious, and we shall again have occasion to speak of the cultivation of this plant as a window plant in these papers.

How much joy springs from the single sprig of ivy rising from some favorite niche in the window and gracefully throwing its branching tendrils over the whole window, and rambling carelessly in the wild vagaries of rampant growth. Is it not beautiful? You would think so could you behold a plant of the English ivy growing in my study at this writing. Rising from a recess of my window shelf, it climbs in graceful negligence to the very top of the window, and then passes in festoons of green across the same, at last finding a lodgment within the antlers of a fine specimen of the American red deer that ornaments my room.

Such a plant is often the very beginning of a series of experiments in window gardening, of which so much is said and written, and of which, in fact, so very little is practically understood. Window gardening is fashionable to-day, and very many use a window garden just as they use flowers at a funeral, simply because it is "fashionable" to have them.

Among the not expensive window gardens we may name a device we used in our own sitting room, which we called an "adoptive case," as we made it a receptacle to receive our flower pots, and our experiment not being patented, and not beyond the constructive genius of the village carpenter, of course any one who chooses can have one made to order. Our window shelf being six inches only in width, we had a box made that would just fit into our window of the following dimensions:—The length of the box was three feet, the depth fourteen inches, and the width fourteen inches. Into this box we had a zinc pan made that would just fit the inside of four inches in depth. This box was to receive a drainage of surplus water from the plants, had a hole to draw off dirty or surplus water from the end, and was stopped with a wooden stopper. A box, of this kind, properly made and attended to, would not need drawing off perhaps during a winter, and I am speaking of the winter treatment of plants now. Having placed the zinc pan within the box, fill the same with tolerably small bits of broken crock until it is even with the top of the pan; then cover the top of this pan with a thin piece of board (pasteboard will do), in which holes are bored, and then place your composition or earth for your plants; set out your plants, choosing those of any of the species you may wish, and at once commence your study and treatment of the

same. With such a simple box as this you may grow not only our native American ferns, but add to them from time to time, as your progress in knowledge increases; the rare and beautiful productions of the far off Indies, New Zealand, Mexico, Japan, Australia, and many other countries can be made to contribute their varied treasures to the simple box in the window of our quiet rural home.

How great the improvements that can be made upon this quite simple window arrangement will naturally suggest themselves to almost any one who really and truly loves flowers for themselves alone; and to this class we speak—for this class we write. We do not expect those who buy and wear flowers simply because "it is the ton" do so, or because at the great party given at Mrs. St. John's last week there was a "lovely boquet" placed beside each lady's plate. This is all well as far as it goes, but we speak of those who love these beautiful things of earth for their own sweet refinements, and because in them we behold the teachings of our Father in Heaven.

We cannot feel too grateful for the plant stands in the windows of so many of our country homes, and we always feel the refining influences of such a home whenever we visit it. Nor are our pleasant memories of such sweet scenes enjoyed alone. Said an invalid to me one day, "I have been spending an hour in the sitting room of Mrs. W., and I do think if I could only live among the flowers I should live longer on the earth than I shall."

Having given one or two of our simplest of forms as a sort of basis for the future experimental work of our fair readers, we pass to other and still more elaborate and, perhaps, difficult subjects. Yet this need not be so, for the means of success, we think, lies within the power of almost every one who will perseveringly take hold of the work. Begin, therefore, as I have stated, with simple forms, and time, patience, and a close observation will soon introduce many new flowers to our simple box in the window. Then add at each end of the same three or four shelves, upon which you can place in a concealed rock work of your own originating, a bit of charcoal, with the most common orchid attached, whose "drooping life in the air" is like a new revelation of the wonderful in the kingdom of plants. Now you can, if you please, elaborate the idea. You can make your little rock receptacle sufficient to grow the tulip and the crocus, and you will soon find a place to grow a great many plants you did not possibly think you could have made live by any reasoning other than your thought they might live. You tried to grow them according to your best knowledge, and you succeeded.

This is only one of the rewards of the patient student, and his reward is ever sure. The grand and magnificent beauty of the outer world is only brought within. The cactus and the great palm fern, with their tropical beauty, the colladium and the calla lily, stand side by side in our humble window box, and had Santa Claus only brought it on the bright Christmas morning, with words of cheer and good wishes, we should have exclaimed at once, "All come and witness the floral beauties of my 'wonderful Christmas window box.'"

How our box became, under the wands of two great experimenting genii, a truly wonderful box, a source of many changes and transformations, we shall make plain to our many readers as we progress, with the explanation of our

—"Kindred earth's sweet pastoral."

OLLIPOD QUILL.

Natural History.

SNAKES IN BHOPAL.

I CANNOT express myself as exactly pleased with the guests who claimed my quarters during the rainy season at the Mouti Bungalow. These guests were innumerable snakes, reptiles and insects, who, driven from the garden by the rain, sought refuge some on the low roofs of the out-buildings and others in the basement. Their presence was not by any means desirable, but the snake hunting which whiled away some of the monotony of our lives was not without a certain charm, and had I been an enthusiastic naturalist I might have considered it a perfect godsend. I am very much in doubt whether the collection of reptiles in the *Jardin des Plantes* equalled ours in extent or interest. Imprimis, our bed rooms swarmed with lizards and chameleons of all sizes, big and little, who promenaded over the ceiling and walls. If you lifted up a mat or a carpet, out came a legion of scorpions of various kinds and colors, and centipedes, too, with their thousand stinging points, besides black spiders of prodigious dimensions. As to the snakes, every day brought a new variety. There were black cobras, whip-snakes, goulabies, and other rare kinds. If we only had bottles enough, and a stock of spirits of wine, we might have made a famous collection. Among the reptiles there were two which always caused a certain amount of emotional effect. One was the *Bis cobra*, a hideous lizard of large size, whose forked tongue distils a poison of fearful power, from whence the native name, which means "twenty cobras in one." This dreadful creature encamped himself particularly in my bed, and refusing to retreat, I had to shoot him. The other visitor was a superb Indian boa, (*pytho tigris*), and his snakeship we found coiled up in a closet. He received us with a series of bounds and hissings of such a decided character that we took to our heels. In order to dislodge him we were forced to give him a bath of hot water. Then he made his way through a hole in the wall and went for the garden; however, a heavy stick did the business for him. He was a magnificent creature, with a greenish blue skin, and marked with regular stripes, from whence his name. In length he was about fourteen feet and as thick round as my arm. This boa is the largest of the India snakes, and is sometimes found twice the size of the one we killed. During December and January this boa remains in a torpid condition. He changes his skin in

May. He feeds on rats and other small animals. We had some narrow escapes from being bitten by our uninvited guests, but fortunately escaped.—*Translated for the FOREST AND STREAM from Roussellet's Travels, Tour du Monde.*

EDITOR FOREST AND STREAM:—

DEAR SIR.—In the FOREST AND STREAM, of December 11, is a communication entitled, "Do Snakes Hiss?" As I am something of a "snakist," so far as considerable experience in finding and capturing these reptiles is concerned, I feel prompted, since the communication referred to throws a doubt upon whether snakes hiss, to offer my observations to the readers of your valuable paper. It has long been a well-known fact that certain snakes produce a hissing noise when disturbed, but I am not aware that this faculty has ever been attributed by a reliable observer to any species except the "spreading adders," or hog-nose snakes, (*Arterodon*); and if Mr. Mather had been fortunate enough to come across many of these snakes in the course of his experiments, his doubts in regard to their hissing would very probably have been removed. Many a time have I been warned of the close proximity of a "spreading adder" merely by its loud hiss, which, as has often truly been asserted, reminds one strongly of the hiss of a goose. When producing this noise, the "adder" flattens the head and neck, which is accomplished by straightening to a perfectly horizontal position the moveable ribs of the anterior part of the body. The appearance of these snakes at such times is extremely threatening, and this, no doubt, has earned for them, in all localities where they are known, the erroneous notoriety of their being extremely poisonous. I know certain sections where the "spreading adders," "hissing adders," or "ipers," as they are commonly called, are popularly considered to be the most venomous of all snakes. It may therefore be incredible to not a few, the fact that our so-called adders or vipers are perfectly harmless, and entirely distinct from the poisonous viper of Europe, (*Viperus berus*.)

In this connection, some other peculiarities of "snaix" occur to me. One much discussed, and also much snubbed by some scientific men who are less conversant with nature itself than its mummified remains, is the power to charm birds and animals imputed to some species. I will not here either try to deny or confirm this, but shall only add my experience, which may be taken for what it is worth. The first instance that ever came to my knowledge, was the following:—When living at home it was the custom of my father to take me walking with him on Sundays to the woods; on such an occasion, several years ago, we entered an open glade in the woods, and were surprised to see a blue jay lying flat upon the ground, in a sunny spot, with its wings and tail spread. We both supposed it dead, and I ran to pick it up, when greatly to our surprise it suddenly "came to life" at my approach, and flew up into the trees; at the same time an enormous black snake, (*Bascemion constrictor*) which I immediately noticed, wheeled quickly round and "streaked" into the hazel undergrowth. Upon another occasion I was in an apple tree in an open lot, gathering apples, when my attention was attracted by the unusual excitement of a family of young blue birds, (*Sialia sialis*), upon the rail fence near by. They were twittering excitedly, and were exceedingly nervous in their actions, flitting from one fence-stake to another, now and then flying about a rod towards the tree, and hovering over some object in the grass. When I noticed this, I watched them attentively, and found that their excitement and nervousness increased, and that at each time the birds settled down nearer to the object which I then found to be a snake of very extraordinary appearance, perfectly motionless, about half its body raised from the ground, the neck appearing of a bright scarlet color, and very much swollen. I then descended from the tree as quickly as possible, and after hunting around some time for a suitable stick, advanced toward the snake, which immediately began a retreat and escaped by crawling swiftly under the fence, where it hid so that I could not find it. I got very close to it, however, and noticed that the enlargement of the neck was caused by it having partially swallowed a young blue bird, the legs of which were sticking out of its mouth; while the scarlet color was caused by the stretching of the skin, which, under the scales, was of a bright red tint. The snake was about four feet long, of a black color, with the under side of the body of a brick-red tint. The species I could not determine. The experience of many years' careful observation of the wonders and beauties of nature—and among them snakes as well as birds and plants, have received their due share—and which I have ever studied impartially, and without prejudiced notions, have convinced me that snakes do catch birds by the power of fascination. Numerous observations make me positive in this assertion. Far from imputing to this any mysterious or wonderful character, however, it is my conclusion after a careful analysis of the facts, that it is nothing in the world which influences the victim but curiosity and fear combined, the former predominating, however, until the latter feeling is entirely absorbed in it. The bird comes nearer and nearer to the snake, whose mysterious nature is made more the subject of curiosity by its absolutely immovable position, until the intense feeling of curiosity or excitement of the bird brings it so near that it is quickly seized by the snake when the proper moment arrives. ROBERT RIDGWAY.

SMITHSONIAN INSTITUTE, December 24, 1873.

[NOTE TO THE ABOVE.]

I have carefully read over what Mr. Ridgway has said about the hissing of snakes, and agree fully with him on the subject, having very frequently heard the "Hog-nose Vipers" or "Spreading Adders," (*Heterodon platyrhinos*), go

through that performance as thoroughly and audibly as a goose, appreciable at a distance of several yards.

In this connection I may be pardoned for referring to a characteristic of this same serpent. When coiled up and in the act of hissing, by describing circles rapidly around it with the finger, it is apparently thrown into convulsions and squirms and writhes as if in the agonies of death, finally turning belly upwards, the jaws separated, and the tongue protruding, as if dead. In this, however, it is only "playing possum," as on removing to a short distance, the animal will be seen to return to a natural position and glide off, unless intercepted and made to renew the same performance.

SPENCER F. BAIRD.

ANTLERED DOES.—Mr. Thomas H. Estey, of Marion county, California, writes us that he recently shot an antlered black-tail deer in San Luis, Obispo county, same State, which he supposed was a buck, but which proved upon examination to be a doe. Its horns were about a foot long and pronged. The animal weighed fifty pounds dressed. This gentleman writes to know if antlered does are ever found among the deer family, east. In reply we state that with both varieties of the caribou (barren and woodland), the females have horns, but as far as our personal knowledge and inquiry extend, instances in all other varieties of the Cervus family are very unusual.

DEPARTMENT OF PUBLIC PARKS,
OFFICE OF MENAGERIE,
NEW YORK, December 27th, 1873.

Animals received at Central Park Menagerie for the week ending December 26, 1873:

One pair imported Kerry cattle, *Bos taurus*, Hub. Ireland. Presented by Mr. Thomas P. Ramsdell, Newburgh.

One Irish hare, *Lepus hibernicus*. Presented by Mr. Thomas Hamilton.

Two wild turkeys (cocks), *Meleagris gallopavo*. These birds were captured at Chancellorsville, Va., by means of snares. As it is quite difficult to entrap these birds, great skill must be employed to entice them into the snare. The usual plan is to scatter grain at a considerable distance from the trap, diminishing this distance each day, until finally the bird finds, on raising his head after eating, that he is firmly secured.

W. C. CONKLIN.

Answers To Correspondents.

[We shall endeavor in this department to impart and hope to receive such information as may be of service to amateur and professional sportsmen. We will cheerfully answer all reasonable questions that fall within the scope of this paper, designating localities for good hunting, fishing, and trapping, and giving advice and instructions as to outfits, implements, routes, distances, seasons, expenses, remedies, traits, species governing rules, etc. All branches of the sportsman's craft will receive attention. Anonymous Communications not Noticed.]

BENNETT & Co., Fort Edward.—Price of Glean \$1 50.

R. C. F., Baltimore.—Your question is answered under the head of Kennel.

W. H. S., Germantown, Pa.—What size gun is best for ordinary game shooting, 10 or 12 bore? Ans. 12 bore.

MRS. H. OERDING, New York.—Fort Randall, in Bonhomme county, about 120 miles from Omaha.

DR. B. S., Baltimore.—The "Trapper's Guide" can be purchased of Messrs. Mason, Baker & Pratt, 142 Grand street, New York.

PLANKUS.—Do you think the Gyro a good invention for persons to learn to shoot on the wing, and how can you tell when you hit them? Ans. 1. Yes, very fair. 2. Made of iron painted black, paint over the shot marks after each hit.

J. B. S., Philadelphia.—What are the general charges per day at the islands in Virginia, your correspondent writes about? Ans. The charges at Cobb's Island are \$5 a day and half the birds. Every appliance requisite for wild fowl shooting is found. The board is \$3 a day.

H. C. S., Mobile.—A 30 foot, cat-rigged sail boat, 8 foot beam, with spare sails, rigging, and painted two coats of paint, completed, will cost \$525 delivered to any railroad or vessel in this city. The cheapest way to have the boats sent would be by sailing vessel.

H. S. O., Wilmington, Del.—I have a valuable Gordon setter, his eyes are always running and suppurating. I think a thorn or rusty nail has injured them. What can I do to relieve him? Ans. Give a mild dose of physic and foment the eye very frequently with warm water; afterwards bathe it with an eye water composed of rose water and white vitriol mixed as for a human being, but rather stronger. If the eye still continues to discharge put a seton in his neck. Weak eyes are very frequently the effect of heat of constitution and want of condition.

J. L. HERSEY.—Cracking of ice is caused by its settling or its raising as the case may be. When the air escapes from beneath through air holes, the ice gradually settles, splits, and often throws up ridges. In shallow water the ice is sometimes raised by the concentrated air from different air holes. This also causes it to crack; and when thus broken, and the air is permitted to escape from underneath, it settles to the water's level, below its former position, and this causes it to crack again, *Foyez vous?*

GRAFTON, Vt.—What is Greenheart, where does it grow, and where can it be procured? Where is Lawcewood grown and who are the importers in New York? Ans. 1. Greenheart is a West India wood, imported chiefly from Demerara, but little used for rod making in the United States, though in favor with Canadians. Cargoes come to Hall's occasionally, and by writing to Halls & Creed, ship brokers, you can ascertain who are the importers. A letter to Dingee Scribner, of St. John, N. Brunswick, might possibly secure a small lot, but none in bulk. 2. Lawcewood is also indigenous to the West Indies. John Bernhoeft & Son, 90 Walker street, imported a cargo recently. Small lots might be procured by addressing Andrew Clerk & Co., 48 Maiden Lane, or J. H. Terhune, corner Elm and Canal streets, New York.

MOHAWK, New York.—1st. Is mercurial ointment, commonly known as "blue ointment," good to rub on the inside of the barrels of a breech-loader to keep them from rusting, and if not what is? Ans. For sea water rust mix the very finest emory with the above. 2d. What difference is there in the strength of English powder, No. 3 and Orange Light wing No. 7? Ans. It is about the same, only the orange powder explodes the soonest. 3d. Do you consider 8 lbs. sufficiently heavy for a No. 10 bore gun? Also in a No. 10 that you can use only 4 drachms of powder in with advantage, sufficiently heavy for duck shooting? Ans. 8 lb. gun, 10 bore is heavy enough for game bird shooting. For wild fowl the gun should weigh 9 lbs. 4th. What do you think of the Dougal Lockport gun? Do you consider it one of the best guns made? How does it compare with Scott's? Ans. We have an opinion but decline to state it for obvious reasons. 5th. For what can you import me a red Irish setter bitch of the very best stock? Ans. For \$150. 6th. For about what could you import me a pair of Cocker spaniels of good blood, young, and thoroughly broken? Which would you prefer, black and tan, or liver and white? Ans. Black and tan. \$100.

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INSTRUCTION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Company,

103 FULTON STREET, NEW YORK.

Terms, Five Dollars a Year, Strictly in Advance.

A discount of twenty per cent. for five copies and upwards. Any person sending us one subscription and Five Dollars will receive a copy of Hallock's "FISHING TOURIST," postage free.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices, 50 cents per line. Advertisements in double column 25 per cent. extra. Where advertisements are inserted over 1 month, a discount of 10 per cent. will be made; over three months, 20 per cent; over six months, 30 per cent.

NEW YORK, THURSDAY, JAN. 1, 1874.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal letters only, to the Manager.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited.

We cannot promise to return rejected manuscripts.

Ladies are especially invited to use our columns, which will be prepared with careful reference to their perusal and instruction.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

CHARLES HALLOCK,

Managing Editor.

HAPPY NEW YEAR!

NOW let the joy-bells that usher in the NEW YEAR ring out a merry peal! Let all the rubbish of the OLD—its sorrows, panics, perils, and distresses, go out with the departed dead. Dig deeply the grave, if need be, and bury all in oblivion. Set the old veteran's face toward the East, Indian fashion, pitch him his hour-glass and scythe, pull his cowl over his head, and bid him good speed on wings of time to join the hosts of years that have gone before to make up the cycles. Hopes and promises are ever wound like wreaths of flowers around the chain of the future, and past distresses bring no discouragement to repeated efforts. And yet, after all, not much of serious disaster or peril has marked the year just past. Clouds that threatened have either lapsed away, or actual calamities have been tempered by the purification that resulted.

As for us of the FOREST AND STREAM, whom financial troubles overtook with others, we can hang green garlands upon the milestone that marks the year departed. Our journal is already a success, both pecuniarily and in the estimation in which it is held by its patrons at home and abroad. We presume no newspaper has ever started in this country which so soon established its position; and old journalists pronounce its success a marvel. We have received the recognition in Europe and here of leading scientific men and institutions, and their actual support, in large measure. We promise much for the future, but not more than we can perform. Improvements in quantity and quality of our material will keep pace with the patronage vouchsafed to us. Our friends are both earnest and steadfast, and we feel with kindly sympathy the warmth of the grip which the true brotherhood of sportsmen give us.

Gentlemen: The protection given to our streams and forests, is a guaranty of abundant bags in future. What can we say with more earnest purpose or courteous expression, than to wish you all A HAPPY NEW YEAR, and to express the hope that with the recurring seasons your bags may be always full, and your hearts overflow with kindness to all men, and especially to the beautiful dumb creatures who claim your protection and are entitled to it. Brethren, we salute you!

CHAMPION POINTER DOG "BELLE."—The portrait of this remarkable dog, the champion of England for 1873, the winner of the great Bala Field trials, for all aged pointers and setters, beating Mr. Macdonald's Ranger, Mr. Llewellyn's Countess and Flax, Mr. Slatter's Rob Roy, &c., &c., with pedigree, and points made in the trial appended, sent by mail. Price, \$1. Discount to the trade. FOREST AND STREAM Publishing Co., 103 Fulton street, N. Y.

THE FOREST AND STREAM GREETING.

ON the advent of the New Year the FOREST AND STREAM offers its congratulations to its numerous readers and thinks the occasion a most fitting one for its editor to return his sincere thanks to the public who have so generously given the paper their patronage and support.

Perhaps there is no feeling in the human heart so pleasant, or which impels one to more vigorous action than a retrospective survey taken of obstacles successfully surmounted, and of work accomplished amidst checks and hindrances. If impediments have been placed in our way, they have arisen solely from accidental causes, such as of the monetary crises, which affected all business, and not from any inherent fault within the paper itself.

The projector of the FOREST AND STREAM, had carefully surveyed the ground many years in advance, and was thoroughly imbued with the idea that the gentlemen of the United States, those who hunted and fished, who rowed and sailed, who played cricket or base ball, who loved horses and dogs, who were fond of rational sports, who discountenanced what was coarse and low, would take most kindly to just such a paper as he proposed to edit, and his aspirations of success have been more than verified in the paper of his creation, the FOREST AND STREAM.

From the very first number, issued August the 14th, 1873, the appreciation we have met with has been even a matter of surprise to us. To-day, with our twenty-first number, though in a newspaper sense we may be but a bantling as to years; we have been warmly taken in hand not only by the public, but by our older *confrères* of the press, and have been treated with a respect beyond our years (or months) or merits.

Of course there must be always certain amount of individuality about a paper which gives it its peculiar stamp, but the FOREST AND STREAM owes its success and credit perhaps more to the efforts of its contributors than to anything else. With us the task has been often a most difficult and delicate one, to select from the varied richness which has been showered upon us. From North, South, East and West there has come to us matter of rare excellence, written with freshness and elegance, describing localities, giving notes on birds and fishes, which have not only been of use to sportsmen, but have called the attention of naturalists both at home and abroad.

One, two or three men, no matter how thorough may be their journalistic training, from the peculiar character of their task, cannot, even at their best, always furnish that vigorous and natural matter which often emanates from fresher and younger pens, outside of the profession. We repeat, then, that our sincere thanks are due to our contributors, believing that the success of the FOREST AND STREAM belongs more to them than to ourselves.

But it is for us rather to think of the time to come, and the advance the FOREST AND STREAM must make in this year, than to expatiate on past performances. Now that the first course has been eaten, the appetite whetted, not satiated, what is coming by and by?

It takes time, a long time, to arrange thoroughly all those various lines, which, like telegraph wires diverge from one common newspaper centre. The FOREST AND STREAM has arranged to have correspondence of interest furnished it from England, the Continent, and from the East.

There is a homely adage "that the proof of the pudding is in the eating of it." When at this season the old year is lost sight of, and the new year, strong and lusty at his birth, is greeted with shouts and toasts and merry makings, as the plum pudding is placed on the board, think of us, kind reader. As we are with all of you this year in your rejoicings, (if not in person at least in spirit,) let us hope that we may be even better acquainted, and that a permanent friendship may be made between you and the FOREST AND STREAM, not only for this year of 1874, but for many a long year to come.

WHAT THEY THINK OF OUR RIFLE MOVEMENT IN ENGLAND.

UNDER date of December 19th, the *Volunteer Service Gazette*, the official organ of the English Volunteer Force, copies in full from the columns of the FOREST AND STREAM our extended reports of Creedmoor, and thus editorially comments upon the rifle movement in the United States:—

"We have great pleasure in publishing, from a New York contemporary, a full report of the meeting of the United States Rifle Association in October last. We see that our American cousins are already contemplating the probability of International Rifle matches. May we once more repeat that a team from the United States would be, we are sure, most heartily welcomed at Wimbledon, and that the objections we have so often urged against European International competitions do not apply at all to the interchange of visits of 'eights' or 'twenties' between Wimbledon and Creedmoor."

We perfectly agree with our contemporary in regard to the stupidity of bringing together on the rifle range in an International match, whole companies of men unaccustomed to the more delicate use of the rifle, who fire away monotonously for hours, making ricochets and scoring nothing. Of course practice is necessary for all hands, and while we may watch with interest the exercises of even an awkward squad at the rifle range, when it comes to a match one feels tired and disappointed at having to witness the efforts of tyros."

The reference the *Volunteer Service Gazette* makes to "the objections urged against European International matches," is

directed towards the visits paid by foreign Volunteer troops to England, when contests took place at Wimbledon. Socially, these visits were of the greatest benefit, and with their well-known hospitality, the English Volunteers gave to their foreign guests a most cordial greeting. But when it came to shooting for rifle contests, whole foreign brigades not knowing anything about their weapons, save their drill manual, the exhibition of their shooting must have been as wearisome as it was without practical results.

A rifle range is the place of course for both the muffs and experts. But when at some future time our International match takes place and we send our men abroad, of course it will be only a most carefully selected team, which must represent the *élite* of our rifle shots, and should the Irish team, whose challenge was recorded by us some time ago, pay us a visit, we may feel pretty sure that the best rifle men in Ireland will be selected.

We sincerely trust that the challenge thrown out by Mr. Leech in behalf of the Irish Rifle Association, will be taken up by the members of our own National Rifle Association, and that the Amateur Rifle Club, will make all due arrangements for their reception, and will have the authority to select such American marksmen as they may think the most fitting to enter in the contest. Whether it would be wise to accept the challenge for the coming season of 1874 or to postpone it until our own men have had more practice at long ranges, we suppose the Amateur Rifle Club will best be able to determine.

We feel, though, very certain that when we are honored by a visit from the English or Irish Rifle Teams, the same courtesy on the range, which welcomed our Provincial rifle friends, and which they have most pleasantly acknowledged, will be extended to all the members of the English Volunteer Service.

The *Volunteer Service Gazette* concludes the review of Creedmoor as follows in regard to the Irish challenge victory:—

"The conditions of the challenge are liberal, and do not impose any seriously objectionable restrictions.

The want of experience and need of a reliable long-range rifle of American manufacture may cause some mistrust, but should the American National Rifle Association accept and invite the English and Scotch teams to participate, Wimbledon could scarcely create more interest or a greater furore than Creedmoor." Just as we were writing this, we have the intelligence of the

ACCEPTANCE OF THE CHALLENGE.

In pursuance of the resolution of the Amateur Rifle Club, published in the FOREST AND STREAM of November 27th, a letter has been addressed to their President, Captain Geo. W. Wingate, to A. Blenerhasset Leech, the Captain of the Irish Team, stating the willingness of that Club to accept the challenge on behalf of themselves and the riflemen of America, and asking Mr. Leech to specify the nature of the deposit referred to in his letter. No objection is made to the terms of the challenge, except, that as the range at Creedmoor is limited to one thousand yards, the firing must not exceed that distance.

The letter closes with the remark, that while the Amateur Club, from their recent organization, are not very sanguine of surpassing marksmen of such renown as Mr. Leech's Irish Team, yet, they have no hesitation of assuring them of a cordial welcome to this country.

PRIZE AND FIELD DOGS.

MOST of the pointers and setters imported from abroad of late years, have gained a high reputation at prize dogs, animals that have taken medals and cups as some well advertised prize dog-show. For weeks previous to the show, these dogs have been carefully fed, combed, brushed and medically treated, in order that they may appear on the day of competition, with all their points standing out in symmetrical array before the sensitive eye of the judges. Not satisfied with all this overwrought preparation, the exhibitors even go further; the cages and kennels are all nicely painted, so that the color of the dog may harmonize with the exact shade of the kennel, and so show the dog to the ever critical eye to the best advantage. Again these animals are clothed in an elaborately worked coat, covering the shoulders, ribs and hind-quarters, leaving only the head, legs and part of the neck of the dog to be distinctly seen by the *oi polloi*; so that the general public have no opportunity of judging of some of the most important parts of the animal—that is the chest, ribs and hind-quarters. We, of course, admit that the head of any animal, like the head of man, is or ought to be the prominent characteristic feature of the entire body; but we do consider as ranking next in importance, the hind-quarters or propelling part of the dog. Many sportsmen have remarked to the writer about prize dogs in language like the following: "What a splendid dog he is to look at! How beautifully his head is shaped! Quite the correct color for shooting over! Observe his fine feathered tail and silky coat!" Just take him out in the field, however, and he will be found for shooting over game not worth the powder to kill him.

Now take the case of field dogs. They must perform well or they are worthless for any and every purpose. As a general thing those field dogs are not the beau-ideal of perfection of beauty, nor are they the marvels of symmetry that most persons outside the shooting fraternity imagine them to be, but take them into the scrub oak and brush, which is the only test of a dog for the purchaser and sportsman, it is there these animals show their wonderful breeding, training and extraordinary bringing out of the dormant

instinct. When such animals get accustomed to the sound of the voice, it is indeed a great pleasure and instructive recreation to shoot over them. The case of the English Champion Pointer "Belle," is an exception to the above rules of excellence and beauty combined, as she is acknowledged even by her opponents, who differ with Mr. Price as to strain, breeding and training, to be the handsomest and best working dog they ever saw, having a chest and neck like a Flanders mare. We know of one pointer more especially, who is extremely ungainly looking; his color is like dirty brick dust and yellow; his head is poorly put on, with a fairly well-shaped and strong-scenting nose; but his hind quarters show form of action, and working powers in the field, especially when drawing on game, which is unsurpassed by any animal that has come under our notice. We are firmly impressed that this dog would give "Belle" a very severe trial if the points for "Drawing" in the late field trials in England were raised to 10 points and "Breaking" reduced to 15 points. We feel assured that this homely looking dog would beat with ease on these particular points the justly celebrated English pointer. The great desideratum in the purchasing of these animals, which is devoutly to be wished by all true sportsmen, is the grand combination of form, beauty and symmetry; and above all, a staunch, steady, energetic animal. Give us the imported Red Irish setter, crossed with many American bred dogs we could mention, the puppies of which, when well trained on the silent system, we believe would excel in fair open field trial any dogs that the world could produce.

THE WAR DEPARTMENT AND RIFLE PRACTICE.

IT is most especially to be hoped that the rifle movement so successfully inaugurated by the National Rifle Association will have the widest development. Now that the winter prevents rifle practice, it behooves the numerous National Guard organizations throughout the country to talk over and discuss their plans for having ranges of their own, or to affiliate with the National Rifle Association. There is no reason why, with the excellent material they have in the west, at Chicago or St. Louis, that one or both of these cities should not have ranges constructed after the model of Creedmoor for the use of their soldiers and sportsmen. We can assure them that the managers of the National Rifle Association would give them all the help and advice in their power. We even entertain the hope that the inauguration of a range in the west will not be far distant.

This question has been on our minds for some time. Why are not some steps taken to make the National Rifle Association a national institution? The rank and file of the United States army want instruction in rifle practice quite as much as the National Guard, if not even more. Why cannot Congress authorize the offering of prizes, on behalf of the United States, to be given to each regiment in the regular army, with a certain amount of prizes to be distributed annually to the best regiments or their teams in the militia of the different States, together with a valuable prize to be shot for at Creedmoor once every year, the contestants being the best shots, taken from among the regulars and the militia of the United States?

This would be simply following an example which has been found abroad to be of the utmost value. The Queen's prize at Wimbledon places the regulars and the volunteers together on the rifle range, and brings together two thousand of the best marksmen that can be found in England or the colonies. What good reason can there be why a similar prize cannot be offered by the War Department of the United States? Although we may be in a period when people are clamorous that all Government expenses must be retrenched, the expenses for such an undertaking would amount to little or nothing.

Of the use of such practice it is hardly necessary for us to state the great advantages to be derived from it. Let us take our late trouble with Cuba as an example. Had there been war with Spain, an immediate call would have been on the militia for the defense of our coast. How much more secure we would have felt had we been assured that all our volunteers were skilful with their weapons. As to regulars, the Modoc campaign might never have occurred, or would certainly have had a more rapid and less sanguine termination, had our regular troops been better acquainted with their rifles. It was a contest between savages who knew how to use their guns and regulars who had no practice with their rifles.

We believe that most of the officers of the United States army think with us as to the necessity of their men applying themselves more thoroughly with the use of their weapons, and at least for the present we can hardly imagine a better method, or one better calculated to engender brisk rivalry than to pit the National Guard against the regulars on the rifle range.

General Ord, who seems to most fully appreciate the value of the rifle practice, and who has always given every encouragement to Creedmoor, in one of his orders to his troops instructed them "to use the Government timber in making targets," and added this most pithy sentence, "that it was cheaper by far to use up the wood in this way than in making coffins."

If the use of a rifle range has already worked wonders among our own National Guard, developing an *esprit de corps* and stimulating the men to excel—rifle practice relieving them somewhat from the monotony of the drill—what might not intelligent rifle practice, fostered by Government aid, do for the privates in the regular service? It

would while away the tedium of many a soldier's irksome hour, and inculcate a love for their profession, and thus do away with that indifference and consequent desertion which seems now to be the bane of the regular service. Nay, more, the self-reliance acquired by the soldier in the regular service on the rifle range might often save his own life and allow him to triumph over his foe.

THE AMERICAN CENTENNIAL.

AS 1873 passes away, and '74 commences its career, but two years and a half intervene between to-day and the great American Industrial Exhibition to be held on July the 4th, 1876, at Philadelphia. The time then for the preparation of this enterprise of untold grandeur and magnitude will be but short. If the ways and means to be found, some \$10,000,000, require a certain period of time, the huge extent of buildings to be erected, to cover some thirty-five to forty acres of ground, even if they were to be commenced to-day must take fully two years to complete. The permanent building is to cost alone somewhere between two and three millions of dollars, and the machinery, horticultural and agricultural halls, \$500,000 each. The Centennial Board of Finance who have heretofore confined their operations to Pennsylvania, have had already \$3,500,000 subscribed.

"The event to be commemorated," as was stated by Mr. McKean, one of the Philadelphia Board of Finance, "is the grandest in the political history of the world." The exposition will show the progress made in art, agriculture and manufacture during the first one hundred years of our national life. If Pennsylvania is supposed to be the manufacturing State, New York has more manufactories than the Keystone State. It is then not impossible to suppose, that from her proximity to Philadelphia, New York alone will require more space than was occupied by all France and England at the late Viennese exhibition.

We sincerely trust that the expression of sympathy, not given by words but by action on the part of the City and State of New York, and from all other sections of the country will be the best disavowal of all ideas of local rivalry, and that there will be a recognition of this most noble endeavor to perpetuate the memory of our Independence in its fullest and broadest sense. From abroad, the prospects are of the most encouraging character. The great German, Prince Bismarck, has recommended the acceptance of the invitation and has advised the appointment of a commissioner for each state of the German Empire, and that a resident Plenipotentiary be sent to Philadelphia to reside there until the close of the exhibition. France and Belgium have shown, too, a friendly alacrity in deciding to participate in the exhibition. Even far off China and Japan will send their wonderful goods, and a grand Turkish Bazaar rivaling that of Constantinople is promised.

Amid this forthcoming avalanche of goods and chattels, the work of all the brains and genius of a civilized world, though we may be driven to madness amid this chaos of wonderful things, we too of the FOREST AND STREAM, must take a large interest. Where will we find but in this coming Centennial a collection of all the sporting attributes, the guns and fishing implements of the world? A large and spacious quarter of the exhibition devoted to this purpose alone would excite untold curiosity, and afford a wonderful amount of instruction.

The whole scheme is a colossal one, and the Centennial no doubt will be made worthy of the great event it celebrates.

The United States Commissioner of Fish and Fisheries has lately received through the agency of Messrs. Middleton, Carman & Co., the well known fish dealers of Fulton market, very fine specimens, in perfect condition, of the English turbot, brill, and sole, which have been carefully cast in plaster and added to the collection of casts of food fishes and deposited by the commissioners in the National Museum at Washington.

This collection, which we had the pleasure of examining a short time ago, while visiting Washington, is one of extreme interest and importance, and is altogether unique in its character, embracing already some three hundred specimens, of various sizes, from the smallest up to fish that weighed originally 750 pounds.

The fish are cast on slabs and framed. They are painted in oil by an accomplished artist, so as to seem an almost exact reproduction of the original fish as just taken from the water. Among the specimens shown to us are the California and Maine salmon of both sexes and of various stages of growth and condition, numerous sharks, skates, rays, flat fish, herring, shad, mackerel, etc.

We would advise any of our readers who may happen to be in Washington not to omit calling at the Smithsonian Institution to inspect this beautiful collection, or such portion of it as is on exhibition.

—The veteran angler and author, Thaddeus Norris, Esq., of Philadelphia, well known to every lover of the "gentle art" through his "American Angler's Book," has been spending a few days in Washington as the guest of Mr. Wilkinson, of K street, who gave him on the 23d inst. a little complimentary dinner, at which were present the following friends of the rod and the fish, viz.: Prof. Gill, of the Smithsonian Institution, Mr. Miller, Deputy U. S. Commissioner of Fisheries; Dr. Frank Reilly, of the Bureau of Marine Hospitals; Dr. Yarrow, Surgeon Naturalist of the Wheeler expedition, and Judge Thacher, Assistant Commissioner of Patents. Charles Hallock, of New York, editor of the FOREST AND STREAM, who was an invited guest, was hurried off to Philadelphia by business a day or two previous.

Sporting News from Abroad.

WHAT! Has a regular challenge, in all its accepted forms, been absolutely thrown out by the English House of Commons to the august House of Lords, the former to contest with the latter in a steeple chase? *Land and Water* distinctly states that the challenge (so they understand) has been given or will be given by an Honorable member of the House of Commons; who represents one of the midland counties of England. If the English Parliament makes the Derby a *dies non*, why should they not be willing to devote another day to a regular stiff cross-country race. Certainly such an event would attract more attention than even one of their most stirring debates. Lords and Commons as contestants in pigeon matches and rifle shooting, though not distinctly stated as sporting rivalities between the two branches of her Majesty's government, have been quite common. If such a steeple chase should take place among the younger members of the House, we are inclined to think the Lords would carry off the honors. If the English nobleman who sits by prerogative of birth in the House of Lords, is passably haw-haw, and makes but poor and indifferent speeches, all the talent of England, being in the lower House, very probably in field sports the Lords are the superior of the Commons. A hunting and coursing *prestige* belongs to the Lords, and did we wager on sporting events, we would give odds in favor of the House of Nobs. Fancy such a proposition as the above emanating from an American source! Think of it, ye grave members of the Senate, or ye more boisterous ones of the House of Representatives! A challenge, *en regle*, between Messrs. Blaine, Dawes and Bingham and Conklin on one side, and Messrs. Butler, Sumner, Schurz and Thurman on the other, to mount horses and to ride five miles out at full speed, over ditches, plowed fields, artificial and natural obstacles. How elegantly Mr. S. S. Cox and Mr. Fernando Wood would act as starters, and then for judges we might have Messrs. Edmunds and Morton. Alas, we are afraid that no matter how carefully every preliminary of the Washington steeple chase would be arranged, it would after all take a decided political bias, and that the steeple chasers; the flyers, and the representative jocks, instead of each one sporting his respective colors, and trying to win for the fun of the thing, would all be marshalled under two sets, the Republicans and the Democrats, and that the best rider on the best horse would make the winning post the stepping stone to some Presidency in the future. There is however a good strong and healthy tendency towards field sports in both our Houses which we trust in time will be better developed, and it is exactly to this element that the FOREST AND STREAM looks for aid and support in those measures for the preservation of our forests and the founding of public parks which we so strenuously urge.

—The question of deer vs. sheep in Scotland seems to have been most carefully investigated by the recent Game Laws Committee, and the conclusion arrived at was that deer can live and furnish food where sheep cannot even exist. It was shown to the committee that on a certain grazing farm, 2,000 head of deer could be kept, which might carry 6,000 sheep, but that the former would yield 38,640 pounds of venison every year, while the quantity of mutton furnished would be less, while the expense of keeping the deer was nothing, whereas the sheep had to be fed during the winter. Of course all arguments in favor of having deer on Scotch ground would not hold for a moment if the land could be tilled and planted, but it seems to be quite conclusively demonstrated that in most of the cases where land has been given up to the deer that it was soil of the most worthless character and unfit for cultivation.

—The great coming event in England in coursing is the Waterloo cup, and so far no less than sixty-four entries have been made. It may be a long time before such a grey hound as Lord Lurgan's Master McGrath will be found, and all English coursing devotees regret the retirement of Lord Lurgan from the field in consequence of his ill health. To have bred and owned in a lifetime one such wonderful dog as Master McGrath is honor enough.

—The London *Field* has a most clever correspondent who writes of chamois stalking in the Tyrol. The huntsman was among the Tyrolean Alps, and pluckily follows a chamois down a precipice. The *Field* correspondent being belated, passes a night in the piercing cold winds, some 9,000 feet above the sea, and barely escapes freezing to death. Of course this is one of the chances of this arduous chase. It is the conclusion which quite interests us. The chamois hunter says: "Eight hours afterwards I was safely sheltered in my country inn at Schwaz. Leaving by the night express, I sat, sixty hours later, before a comfortable fire in my lodgings in London, and nobody could have imagined that three nights previous I passed twelve hours, which at that time seemed to me an eternity, high up in the Tyrolean Alps." Most pleasantly written is this, and one can imagine the writer to the *Field* seated cosily, in slippers and dressing gown, in his own snug quarters, may be meercbaum in mouth, scarcely able to realize himself, in this rapid locomotive era of ours, how, in so short a time, the transition was made between the dreary Alps and his own comfortable quarters. Of course one may tire of pointing out the wonderful means we have now at our command of running from place to place over the world. Here seated in our editorial rooms we can leave in a train in just twenty minutes and in seven hours' travel from 103 Fulton street,

we can have a shot at a bear who is ranging the woods just 120 miles from our desk, (so at least a correspondent informs us whose kind note of invitation we are just in receipt of.) As for that, in sixty-nine to seventy-two hours easy going from New York we can kill a buffalo, and if we wish to have this pleasant diversion with all its accompaniments, could have, by journeying some seven hours more, a neat scrimmage with our brother Lo, and either raise hair or have our own grizzly locks taken as an ornament for some peripetetic lodge pole. Who knows but that some day, after breakfast, our great-grand-children may not go off to the Papuan islands, shoot a brace of birds of paradise for their sisters, and return in time for dinner, which plumes their fair sisters may want to deck their persons with at a soiree to be held the same evening in Kamtschatka.

—French sportsmen are in great commotion in regard to a change in the game laws. There is a rumor that hunting permits, or the right to carry a gun, are to be raised from 25 to 50 francs; that a considerable tax is to be imposed on powder and shot, and even that all shooting (game bird shooting?) shall cease for a year, in order that the game may increase. We notice too in the *Chasse Illustrée* a curious instance of the French red tape system. M. M. Lamarche and Lavigne, game and provision merchants, of Paris, expected to have shipped to them from New York on the 29th of last month, a consignment of prairie chickens and buffalo meat for the delectation of the Parisian gourmands. Now, according to some very arbitrary rulings of the commissioner who has the subject of the Parisian markets under his charge, these enterprising provision merchants are not to be allowed, according to the august judgment of the commissioner, to sell buffalo meat, as this bureaucrat cannot understand that buffalo is game, but classes its meat with the beef derived from the tamer bovine races. The hitch is that in the certain markets where Messrs. Lamarche and Lavigne want to sell their buffalo meat, game only is allowed to be sold. M. Chevalier, the excellent editor of the *Chasse Illustrée*, of course takes up the cudgels for the bison, which he very properly declares to be a game animal. Should the French bureaucrat be on the prairie with an old buffalo bull, head down, eyes flashing fire, and charging at him, he would very possibly not only learn a lesson in natural history, but acquire the fact that the buffalo is decidedly game.

—The question is being agitated by the liberal party in Holland of removing entirely all the game laws.

FOOD FISHES OF THE UNITED STATES.

We are much gratified at the opportunity herewith afforded to aid in the very important and arduous work in which Professor Baird is engaged, and trust that his appeal will be warmly responded to. It is the duty of every one and directly to his own interest, to contribute what he knows of the food fishes in any given section of the country.

UNITED STATES COMMISSION, FISH AND FISHERIES,
WASHINGTON, Dec. 23, 1873.

EDITOR FOREST AND STREAM:—

DEAR SIR:—One of the duties with which I have charged myself as U. S. Commissioner of Fish and Fisheries is to prepare and furnish to Congress a report upon the food fishes of the United States, to consist of descriptions of the genera and species, together with as copious biographies as may be procurable, the whole to be illustrated by reliable figures of the species.

Although I devote much time every summer to personal research in this direction, it is impossible for me to cover the ground completely, and I am desirous of securing the assistance of all who have any facts at their disposal towards accomplishing my object in a satisfactory manner.

I enclose to you a series of questions in reference to a number of the subjects of special inquiry, and shall be greatly indebted to any of your correspondents for answers to any, in regard to any particular species. In giving these answers it is not necessary to repeat the question itself but merely to refer to its number.

I am already indebted to many gentlemen for service in this connection and I hope through the instrumentality of your widely circulated paper to secure many additional data. Full credit will of course be given in my report to all to whom I am under obligations.

I can supply pamphlet copies of the questions to those who may desire them. Very truly, yours,

SPENCER F. BAIRD,
Commissioner.

CHARLES HALLOCK, Esq.,
Editor of FOREST AND STREAM.

MEMORANDA OF INQUIRY RELATIVE TO THE FOOD FISHES OF THE UNITED STATES.

- A. Name of fish in different localities.
- B. Geographical distribution at present time; change of location with season of year in former times; supposed cause of any permanent change.
- C. Abundance; at present time, in different seasons and localities; in former times, in different seasons and localities; supposed cause of variation in abundance; probable change in the future.
- D. Size; maximum length and weight; average length and weight; rate of growth; length and weight at one, two, three, etc., years; difference in sexes in this respect.
- E. Migration and movements; arrival and departure; period of stay; certainty of arrival; route of movement, coming and going; number and times of runs or schools in one season, and differences, if any, in the runs; differences in arrival of the sexes and ages; feeding of fish after arrival; summer abode; winter abode; if anadromous, when entering the fresh water and when leaving; if anadromous, what the movements up and down fresh waters, of adults or of young; rate of progression of schools in fresh or salt water;

relation of movements to tides; depth of water preferred by schools or single fish; temperature and general condition of water preferred; favorite localities in any region, whether bottom be sandy, rocky, muddy, grassy, etc.

F. Relationships; to its own species, whether gregarious, solitary, grouped by age or sex at any season, predaceous, etc.; to other animals, whether preyed upon by them, feeding upon them, etc.; special enemies, friends or companions.

G. Food; nature; mode of taking it; time of taking it; quantity consumed.

H. Reproduction; interference with spawning, by lines, nets, etc.; age of male and female, respectively, when capable of reproduction; change in physical condition, (color, shape, fatness, etc.) date of spawning, and its duration as relating to the individual as well as to the species; preferred localities for spawning, as to place, temperature, etc.; special habits during spawning season; special habits before or after spawning; ratio of mortality in old fish from spawning; number of successive years of capacity for spawning; nesting places; are nesting places prepared? if so, whether of grass, stones, sand, etc., or cleared areas, and whether made by one sex only, or both; if ridges or furrows are formed, how made; the eggs; mode of fecundation; where laid; where and how attached, if at all; covered up, and how, or exposed in water; number laid by one fish at one time, and the number during lifetime; size and color; special enemies; guarding of eggs by either sex; the embryo and young fish; ratio of fish hatched to number of eggs laid; proportion of young fish attaining maturity; movement after birth, whether remaining on spawning ground and how long; or whether changing from fresh to salt, or salt to fresh water, etc., and when; general appearances, and successive changes; rate of growth; special food; enemies and diseases of eggs and young; relation of parent fish, of either sex, to young; whether protective, predatory, etc.

I. Diseases.

K. Parasites.

L. Artificial fish-culture.

M. Protection by law.

N. Capture; methods; by lines; by nets, floating or movable, (seines, gill-nets, etc.) fixed, (traps, pounds, weirs, dams, etc.) other methods of capture; bait; influence of modes of capture on abundance; season of capture; by lines; by nets; otherwise; time of tide when taken; statistics of capture; by lines; by nets; otherwise; value of fish taken; disposition of fish taken; economical value and uses; for food, (fresh, salted, smoked, dried, etc.) for oil; for manure; for other purposes; price, in its variations with place, season and year; export and trade, in their variations with place, season and year.

P. Remarks relative to foreign or domestic allies.

QUESTIONS RELATIVE TO THE FOOD FISHES OF THE UNITED STATES.

A. NAME.

1. What is the name by which this fish is known in your neighborhood? If possible, make an outline sketch for better identification.

B. DISTRIBUTION.

2. Is it found throughout the year, or only during a certain time; and for what time?

3. If resident, is it more abundant at certain times of the year; and at what times?

C. ABUNDANCE.

4. How abundant is it, compared with other fish?

5. Has the abundance of the fish diminished or increased within the last ten years, or is it about the same?

6. If diminished or increased, what is the supposed cause?

7. What is the amount, or extent, of the change in the abundance?

D. SIZE.

8. What is the greatest size to which it attains, (both length and weight,) and what the average?

9. State the rate of growth, per annum, if known; and the size at one, two, three, or more years.

10. Do the sexes differ in respect to shape, size, rate of growth, etc.?

E. MIGRATION AND MOVEMENTS.

11. By what route do these fish come in to the shore; and what the subsequent movements?

12. By what route do they leave the coast?

13. Where do they spend the winter season?

14. When are the fish first known or seen to come near the shore, and when does the main body arrive; are the first the largest; are there more schools or runs than one coming in, and at what intervals?

15. When do the fish leave shore, and is this done by degrees or in a body?

16. Is the appearance of the fish on the coast regular and certain, or do they ever fail for one or more seasons at a time, and then return in greater or less abundance? If so, to what cause is this assigned?

17. How do the runs differ from each in number and size?

18. Which sex comes in first; and how far advanced is the spawn in the female on first arriving?

19. Will either sex, or both, take the hook on first arriving; and if so, is there any period of the stay of the fish when they refuse it?

20. If they refuse the hook at first, how soon do they begin to take it after arriving?

21. Do the schools of fish swim high or low; and is their arrival known otherwise than by their capture; that is, do they make a ripple on the water, do they attract birds, etc.?

22. What is the relation of their movements to the ebb and flow of the tide?

23. Does spawn ever run out of these fish taken with a hook?

24. Answer same question in regard to fish taken in nets or pounds; is the spawn ever seen in any quantity floating about inside of nets?

25. Are these fish anadromous; that is, do they run up from the sea into fresh water for any, and for what purpose?

26. If anadromous, when are they first seen off the coast; when do they enter the mouths of the rivers, and what is the rate of progression up stream?

27. If anadromous, what the length of their stay in fresh water, and when do they return to the sea?

28. Do the different sexes or ages vary in this respect?

29. Do these fish come on to the breeding grounds before

they are mature; or do you find the one and two year old fish with the oldest?

30. What are the favorite localities of these fish; say whether in still water or currents; shallow or deep water; on the sand; in grass; about rocks, etc.?

31. What depth of water is preferred by these fish?

32. What the favorite temperature and general character of water?

F. RELATIONSHIP.

33. Do these fish go in schools after they have done spawning; or throughout the year; or are they scattered and solitary?

34. Have they any special friends or enemies?

35. To what extent do they prey on other fish; and on what species?

36. To what extent do they suffer from the attacks of other fish, or other animals?

G. FOOD.

37. What is the nature of their food?

38. Are there any special peculiarities in the manner of feeding of these fish?

39. What amount of food do they consume?

H. REPRODUCTION.

40. Is there any marked change in the shape or color of either sex during the breeding season; or any peculiar development of or on any portion of the body, as the mouth, fins, scales, etc.?

41. Are there any special or unusual habits during the spawning season?

42. Is spawning interfered with by lines or nets, or otherwise?

43. At what age does the male begin to breed; and at what age the female?

44. For how many years can these fish spawn?

45. Does the act of spawning exert an injurious effect?

46. Where do these fish spawn, and when?

47. Can you give any account of the process; whether males and females go in pairs, or one female and two males; whether the sexes are mixed indiscriminately, etc.?

48. Is the water ever whitened or colored by the milt of the male?

49. What temperature of water is most favorable for hatching.

50. At what depth of water are the eggs laid, if on or near the bottom?

51. What is the size and color of the spawn?

52. What is the estimated number for each fish; and how ascertained?

53. Answer the question for one season, and for the lifetime.

54. Do the eggs, when spawned, sink to the bottom and become attached to stones, grass, etc., or do they float in the water until hatched?

55. Do the fish heap up or construct any kind of nest, whether of sand, gravel, grass, or otherwise; and if so, is the mouth, the snout, or the tail used for the purpose, or what; and if so, how is the material transported; or do they make any excavation in the sand or gravel?

56. Do they watch over their nest, if made, either singly or in pairs?

57. When are the eggs hatched, and in what period of time after being laid?

58. What percentage of eggs laid is usually hatched?

59. What percentage of young attains to maturity?

60. What is the rate of growth?

61. Do the parents, either or both, watch over the young after they are hatched?

62. Do they carry them in the mouth, or otherwise?

63. What enemies interfere with or destroy the spawn or the young fish? Do the parent fish devour them?

64. Are the young of this fish found in abundance, and in what localities?

65. On what do they appear to feed?

I. ARTIFICIAL CULTURE.

66. Have any steps been taken to increase the abundance of this fish by artificial breeding?

K. PROTECTION.

67. Are these fish protected by law or otherwise?

L. DISEASES.

68. Has any epidemic or other disease ever been noticed among them, such as to cause their sickness or death in greater or less number?

69. When have these epidemics taken place, and to what causes have they been assigned?

M. PARASITES.

70. Are crabs, worms, lampreys, or other living animals found attached to the outside or on the gills of these fish?

N. CAPTURE.

71. How is this fish caught; if with a hook, what are the different kinds of bait used, and which are preferred?

72. If in nets, in what kind?

73. At what season and for what period is it taken in nets, and when with the line?

74. What would be the average daily catch of one person with the hook, and what the total for the season?

75. Answer the same question for one seine or pound of specified length.

76. Is the time of catching with nets or pounds different from that with lines?

77. Is it caught more on one time of the tide than on another?

O. ECONOMICAL VALUE AND APPLICATION.

78. What disposition is made of the fish caught, whether used on the spot or sent elsewhere, and if so, where?

79. What is its excellence as food, fresh or salted?

80. How long does it retain its excellence as a fresh fish?

81. To what extent is it eaten?

82. Is it salted, and to what extent?

83. Is it used, and to what extent, as manure, for oil, or for other purposes, and what?

84. What were the highest and lowest prices of the fish per lb. during the past season, wholesale and retail, and what the average, and how do these compare with former prices?

85. Are these fish exported, and if so, to what extent?

86. Where is the principal market of these fish?

87. Name and address of observer.

88. Date of statement.

—Two fine horses, bitten by a mad dog in Baltimore county, Maryland, have been seized with hydrophobia, and killed.

Sea and River Fishing.

FISH IN SEASON IN JANUARY.

Pompano.
Snapper.
Grouper.
Rockfish.

SOUTHERN WATERS.
Trout, (Black Bass.)
Drum, (two species.)
Kingfish.
Striped Bass, Rockfish.

Sheepshead.
Tailorfish.
Sea Bass.

—We have received the fourth annual report of the Fishery Commissioners of New Jersey, but too late for review in this issue of our paper.

—Perch fishing at Quogue has been remarkably prosperous this season. The profits may be judged by the fact that one fisherman cleared \$400 in one week.

—A meeting of the Anglers' Association of Boston, for the protection of fish, was held at Pythian Hall last Saturday evening, Dr. John P. Ordway, presiding. After the reading of the records a partial report on the subject of the preservation and better protection of lobsters was made by Capt. Charles Stanwood from a committee appointed at the last meeting to consult with dealers relative to the best method of restriction in catching and exposing for sale lobsters during the spawning season. The committee desired an extension of time to continue their investigations, which was granted them. A number of members were elected, and the meeting adjourned.

—Some question having arisen in regard to the edible qualities of the Sacramento salmon (which we are now introducing so largely into the waters of the Middle States), as compared with those found in Maine and New Brunswick, we herewith print a note just received from Livingston Stone, which bears upon the subject:

"In the quality of its flesh, I think the Sacramento salmon compares very favorably with the salmon of the Atlantic rivers. The reputation of the Sacramento fish has undoubtedly suffered from the fact that it is or has been till quite recently, offered for sale in the markets at all seasons of the year, including several months when it is out of condition. Had this fish been caught and marketed only when it is in its best condition, as is the case with our eastern salmon, it is more than probable that its excellence would have remained unimpeached, and that it would have ranked universally or very near on an equality with the Maine and Canadian fish. Many persons eating Sacramento salmon in San Francisco in August, when it is a coarse, inferior fish, have pronounced the salmon of this river nearly worthless, while if they had eaten the same fish in the winter months, they would have thought no name too good for it. My own experience has been that the Sacramento salmon, when in season, is a very rich, firm, and delicious fish, and I am wholly unable to say that I can detect in it, when in its best condition, any inferiority to the salmon of the Atlantic rivers. I feel quite safe to say, however, that if it is not equal to the Eastern salmon in quality, it approaches them so nearly that no reasonable objection can be made to its general introduction on this score.

—Our correspondent whose letter follows herewith makes some very serious complaints, which we know to be well founded, of the insufficiency afforded by the existing laws for the protection of game in New Brunswick. As to fish, the legal restrictions are ample and operative in general, though some localities evidently suffer from the inefficiency or delinquency of the fishery officers. All dams should be provided with fish-passes, as the law directs.

ST. JOHN, N. B., Dec. 22d, 1873.

EDITOR FOREST AND STREAM:—

I have long been tempted to send you a few facts concerning fishing and shooting in the vicinity of St. John. Having spent a great part of my time about its lakes, streams, and forests I fancy that I have a pretty good idea of what might be done if things were properly handled. We would have an abundance of game, if they were allowed to breed and grow to maturity, which I am sorry to say they are not. Our woodcock are shot out of season—principally in August—when the middle of September is quite soon enough to begin shooting. Then we have plenty of time and lots of good birds. Our partridges are shot in thousands before they are half fledged. Our trout are murdered the whole year round and at all seasons, sometimes by gentlemen who call themselves fishermen and sportsmen. Moose, caribou and deer are slaughtered late in winter, and left in the woods to rot, merely for the sake of their skins. We have a law in the Dominion, but I am sorry to say it is badly looked after. I spent a fortnight with a friend of mine, Mr. Climo, photographer, of St. John, taking views in the vicinity of St. Martins, also of Salmon river and its tributaries, a few miles further up the Bay of Fundy. It is a fine river and would be well stocked with salmon, were they allowed to get in it, but they are stopped by a saw-mill and dam at its entrance; they are there in thousands every year trying to get up but cannot for the want of proper fish way. W. H. BOYER.

EDITOR FOREST AND STREAM:—

I am pleased to see by your paper, of December 18th, that a beginning is to be made in stocking our streams with salmon; but, as an angler, I must enter a protest against the streams selected. Professor Baird says:—"Mr. Green is to place 50,000 young fish near Fort Edward, and a quantity in the Conchocton River, an upper tributary of the Chemung, which empties into a northern branch of the Susquehanna. He will place some also in Oswego and Salmon Rivers, and possibly in the Genesee." The Conchocton, though not by any means the most suitable tributary of the Susquehanna, will do very well if salmon ladders are con-

structed on the hundred dams of the Chemung and Susquehanna, which I doubt. Salmon River, though small, is a fine, clear, rapid stream, admirably suited to the fish. But why select the Oswego and Genesee? The one is a dull, muddy stream, as little like a salmon river as a Jersey Salt Creek; and the other is obstructed by no less than four falls from twenty to ninety feet high, besides which it flows for a long distance through a flat country, unbroken by a ripple or even a sand bar, and both of these streams run through busy manufacturing cities. It seems to me that it would be best to stock our rivers that are most adapted to salmon first, and then, if desirable, we could attend to these. Has Mr. Baird calculated the cost of building salmon ladders over the falls of the Genesee? or does he suppose the fish would not need to ascend from Rochester? If it is desired to stock some streams flowing into Lake Ontario, why not select the Black River, which rises amid the Adirondacks and receives the waters of the Moose, Beam, Independence, and a dozen other streams, all admirably suited to salmon? Or would not the Oswegatchie or the Raquette make noble salmon rivers? I hope Mr. Green will hesitate before wasting valuable fish upon such streams as the Oswego and the Genesee. FERN FLY.

[The exceptions of our correspondent are well taken, and will receive proper consideration, we doubt not.—Ed.]

—We have received from Dr. D. C. Estey, of Minnesota, several articles upon the game and fish of that State, which we shall publish in due time; also some unique patterns of black bass flies, which are unlike anything we have before seen, and which show by what ingenious contrivances of feather and tinsel the credulity of some fish may be imposed upon. Experts here, who have examined them, express the opinion that they ought to prove a very killing fly.

Shot Gun and Rifle.

GAME IN SEASON FOR JANUARY.

Moose, *Alces Melchis.* Caribou, *Tarandus Rangifer.*
Elk or Wapiti, *Cervus Canadensis.* Squirrels, Red Black and Gray.
Rabbits, common Brown and Grey. All kinds of Wild Fowl.

[Under the head of "Game, and Fish in Season" we can only specify in general terms the several varieties, because the laws of States vary so much that were we to attempt to particularize we could do no less than publish those entire sections that relate to the kinds of game in question. This would require a great amount of our space. In designating game we are guided by the laws of nature, upon which all legislation is founded, and our readers would do well to provide themselves with the laws of their respective States for constant reference. Otherwise, our attempts to assist them will only create confusion.]

With the advent of January the close season for nearly all kinds of upland game commences in the higher latitudes, though wild (water) fowl are in season until their spring migration. In Florida the shooting season for deer, woodcock, quail, turkeys, snipe, etc., continues until March. The moose and caribou in those Canadian Provinces where any law exists, are in season until February, though only the flesh of the females are fit to eat. To us of the Eastern and Middle States all the game that is left for shooting between this and the advent of the August woodcock, are the squirrels and hares, which latter are generally called rabbits.

—C. T. L., of Brooklyn, writes that a few weeks since there was a hunt got up by the sportsmen of Oxford, New York, which was quite successful. At evening the men came in, when the count was found to be as follows:—Captain Bradley's side, 23,690; Captain Miller's side, 17,185. The animals killed and brought in were as follows:—One fox, two racoons, two woodchucks, eight rabbits, seventeen skunks, 338 black and grey squirrels, 206 red squirrels, 3,420 chipmunks, four hawks, ten owls, thirty-five crows, 244 partridges, seventeen pigeons, eight woodcock, two wild ducks, and one crane. The best of good feeling reigned, and it was resolved to have another hunt next year and challenge an equal number from any part of the State.

—J. L. Hersey, a frequent correspondent, writes from New Hampshire of some shooting which he deems worthy of mention. He says: "Jas. A. Doe went out recently and bagged fifteen partridges at sixteen shots, shooting seven of them in fifteen minutes; who will say that there are no sharpshooters in New Hampshire, and no game? Foxes are very abundant, and hunters are having rare sport now, although Reynard don't seem to see it in that light. He don't enjoy the fun of racing through the light snow, with a pack of hounds at his heels, and a chance of being peppered if he comes anywhere near the hunters."

—We have to thank Mr. B. L. Sammis, of the Sportsman House, at Smithville, Long Island, for his basket of fine grown quail; the birds arrived fresh and in good condition.

—The following letter refers to a region whose quality as a superb hunting ground we can vouch for from personal knowledge. There are few districts which surpass those of Elk and Potter Counties, Pa., either for game or fish. Coudersport can be most readily reached from New York city by way of the Philadelphia & Erie Railroad:—

BUFFALO, Dec. 23d.

EDITOR FOREST AND STREAM:—

The forest districts of Pennsylvania are seldom mentioned as good hunting grounds, but in reality, they possess quite as great attractions for the tourist and sportsman as others more frequently spoken and written of. There are to this day woods in Pennsylvania wherein the axe of the destroyer has never sounded, and which stand as they ever stood in all their majestic beauty.

Some short time ago the writer, with two friends, Thos. Cavanaugh and Wm. Powers, (the latter being a well-known hunter in this locality), started out for a few days' hunting

in the forests. We took the 7:20 train from the Buffalo, New York and Philadelphia Railway Depot for Port Alleghany, Pa., situated on the road of that name. Arriving at Port Alleghany we immediately took the stage for Coudersport, Pa., and remained there for the night, as we were now in a country alive with deer and game of every description, and were anxious to be at work. Rising early next morning and partaking of a hearty breakfast, we started off and had a long day's travel, meeting with abundance of game such as quail, ruffed grouse, etc., and getting sight of a few deer. We were hungry and tired when we came upon a good camping ground, and here we decided to remain for the night. After seeing our horses well fed and providing ourselves with a good fire, and a nice bed of leaves and pine boughs, we prepared our supper of boiled rabbits and squirrels, with good bread and coffee. A very comfortable night was spent, considering our situation. At day-break, breakfast over, we were once more on our way. Twelve o'clock arrived and no deer as yet. We now decided upon each taking different routes to meet at a certain point. My route was the middle one, but I determined to keep as close to Powers as possible, (he having the most experience), and after proceeding a short distance we were actually together. Presently he motioned me to his side. The sight that met my eyes was indeed more than I had bargained for; there, directly in front us, within 350 yards, was a large bear rooting in the leaves and grass, entirely unaware of the approach of an enemy. At this moment, however, a distant report of a rifle warned our bear of danger, and he immediately began to move off.

My companion wishing that I should have the first shot, directed me to fire. Steadying my nerves, I raised my rifle, and after a careful aim, fired; when the smoke cleared Mr. Bear was to be seen running briskly off, having been nowise injured by my shot. Powers lost no time in sending a leaden messenger after him, which brought him to the ground, another shot from me, winding up his career. Our friend Cavanaugh now appeared upon the scene, he having also met with very good luck, having brought down two deer, besides quite a number of the feathered tribe. This being more good fortune than we had anticipated, having now secured a bear, two deers and quite a number of partridges, we concluded to camp for the night and retrace our steps in the morning, arriving home on the afternoon of the fourth day. The entire trip cost us about twelve dollars.

By the way, the streams and brooks of this region swarm with fish, especially trout; as for game, woodcock and duck abound. The trip to this region can be made in less time, and with much less expense, than to any other hunting districts.

The nearest and shortest route to this region is via the Buffalo, New York and Philadelphia Railway. The fare from Buffalo to Port Alleghany being only \$2.98.

SHEEHAN.

—Our readers will perceive by the following article taken from the Rochester Union, that quite a treat is in store for them. The Cologne district is one concerning which frequent inquiry is made, and of which little is known. It is one of the grandest hunting districts in America, and will be resorted to next year by a score of our readers, we do not doubt. It is just as accessible as the Adirondacks are:—

Our townsman A. B. Lamberton has just returned from a week spent in the wilds of Canada, deer hunting. He brought back with him eleven deer, five of which fell before his "Adirondack," one of the finest repeating rifles we ever saw. Mr. Lamberton went to Cologne, back of the Ottawa river, and 150 miles north of the St. Lawrence. His camping ground was near where the Cologne river empties into the Ottawa, in the province of Quebec. He was joined by several Canadian gentlemen, and the method pursued was still hunting. The deer were very plenty, and the party could have shot fifty deer if their object had been to shoot more than they wanted.

One of their party on his return to camp on the edge of one evening, heard the howling of wolves, and knew they were after him. He seated himself on the limb of a tree out of their reach, and had the satisfaction of shooting two of the largest which the next morning he took into camp.

Another one of the party—a physician by profession—on his return to camp lost his way, and he wandered about all night. In the morning the party went in search of him. They found him about three miles from camp, almost perished. He wandered in a circle, the same as all persons do who lose their way either in forest or field.

Mr. Lamberton is a great admirer of the Adirondacks, but now prefers the region above mentioned for sporting purposes. The conformation of the country does not afford as fine scenes as the Adirondacks, but in other respects is quite similar. Round and Golden Lakes he speaks of in terms of especial admiration.

By the way, we notice in FOREST AND STREAM for December 4, a very lengthy article by Mr. Lamberton entitled "The Hunter Naturalist in New Brunswick and Nova Scotia." He describes the country he visited last summer and the game to be found there in glowing terms.

Mr. Lamberton intends to write for FOREST AND STREAM a sketch in full of his late visit to the Cologne district of Canada.

BISMARCK, D. T., Dec. 14th, 1873.

EDITOR FOREST AND STREAM:—

"Rare sport we had, Ed. You should have come along." Such was the greeting I received from a party of three sportsmen (*sic*), with two hundred and forty-six pinnated grouse in a wagon, the result of three hours' shooting.

I had been invited the night before to join the party in a trip to the timber which borders the banks of the "Big Muddy," on a hunt for "chickens," but had declined, as I had been on a similar one the week before and I think that one trip will suffice me as long as I remain in the territory.

I will endeavor to explain to the readers of the FOREST AND STREAM the manner in which such a number of birds are found and killed in so short a space of time.

The country for hundreds of miles on both sides of the Missouri river is entirely devoid of timber of any kind. When the cold weather approaches, birds of every description, elk, deer, antelope, and in fact almost every living creature seeks the shelter of the timber which grows in the river bottom. Consequently all you have to do to fill your wagon is to be on the ground early, before the birds leave their roosting places, and you can pick them off like a farmer would his choice fruit.

"Got twenty-one off one tree," said one of the party, and I did not doubt it, for if there is one tree all you have to do is to shoot the lowest ones first, and you can get them all (if your ammunition holds out.) It seems a pity that these noble birds should be destroyed so ruthlessly by pot hunters, but under the Territorial game laws there is no help for it at present. Elk and deer are very plenty hereabouts, and some antelope, but the latter are suffering from a disease similar to the "rot" in sheep. Large numbers have been found dead on the prairies the past fall, and neither the white hunter or Indians can account for it or tell what the disease is.

The "wolfing" season has now commenced, and as it may prove interesting to some of your numerous readers to know how the immense number of the prairie wolf and coyote pelts are secured, I will "rise to explain." The stock in trade of a party engaged in "wolfing" consists in flour, bacon and *strychnine*, the first two articles named for their own consumption, the last for the wolves. The first thing to be done is to procure a bait. Generally a buffalo is used, but if it happens to be out of a buffalo range, then an elk, deer, coon, or other animal is made to answer the purpose. The carcass is then impregnated with the poison and placed where it will do the most good. Sometimes as high as fifty wolves will be found of a morning scattered about at intervals of a few yards from the carcass, that they ate so ravenously of the night before.

The "wolfers" proceed to gather up the animals slain, carry them to camp, fix up another bait if necessary, and then commence the labor of skinning and stretching. It is no uncommon thing for a party of three men to come down in the spring with four thousand pelts, and as they will average one dollar and a half a pelt, it is a very profitable business, if you are only successful in your "catch."

The men engaged in this business are different from the professional buffalo hunters; the trappers are in fact different from anyone but "wolfers." When they receive their money in the spring they always make great calculations on having a "big time" in town, and they generally have it. When their money is gone (and that is in a very few days), they betake themselves back to their haunts in the woods and on the prairies, and are seen no more within the confines of civilization until another spring. EDGAR.

A new plan of pigeon shooting was inaugurated on December 27th, at Babylon, L. I.; Messrs. Livingston and Post shot for \$100 a side, 20 birds each, 21 yards rise, and 80 yards boundary. The conditions were that the shooters should sit on the ground, as if shooting from a "blind," thus: If the pigeons were driving birds and flew close to the ground, it would be extremely difficult to get the gun on them. The birds, however, were scarcely up to the average, and the shooting, considering the above difficulty and novelty, was excellent. Both gentlemen having killed 16 birds out of 20, they shot off the tie at five pigeons each, and this time Mr. Post was successful by killing four birds to his opponent's three.

The second match was between Messrs. Deforest and Snediker at 10 double birds each, for \$100 a side, 100 yards boundary, 1½ oz. shot, Mr. Deforest to shoot at 21 yards rise, Mr. Snediker at 10 yards. After some fine shooting at very slow birds Mr. Deforest won the match by one bird, having killed 15 out of 20, Mr. Snediker killing 14 and losing six.

Then followed a match between Messrs. Griswold and Jones at 5 pigeons each, 21 yards rise, 80 yards boundary, 1½ oz. shot. This match was won by Mr. Griswold, who killed all his birds, Mr. Jones missing the fifth.

SUMMARY.

BABYLON, L. I., Dec. 27.

Match \$200, 20 birds each, both barrels allowed, battery style, 21 yards rise, 80 yards boundary, 1½ oz. shot, between Messrs Post and Livingston.

SCORE.

Mr. Post—1, 1, 1, 0, 1, 0, 1, 1, 1, 1, 1, 1, 1, 1, 0, 0, 1, 1—Total, 20; killed 16; missed 4. Gun used, Westley Richards 10 bore breech-loader.

Mr. Livingston—1, 0, 1, 1, 1, 1, 1, 1, 0, 1, 0, 1, 1, 1, 1, 0, 1, 1—Total, 20; killed 16; missed 4. Gun used, Dougall 10 bore breech-loader.

THE TIE.

Mr. Post—1, 1, 1, 1, 0—Total, 5; killed 4; missed 1.

Mr. Livingston—1, 1, 0, 1, 0—Total, 5; killed 3; missed 2.

SUMMARY.

SAME DAY.—Match \$200, between Messrs. Deforest and Snediker, at 10 double birds each, 100 yards boundary, 1½ oz. shot, Mr. Deforest at 21 yards rise, Mr. Snediker at 10.

SCORE.

Mr. Deforest—10, 11, 10, 11, 11, 10, 11, 01, 10, 11—Total, 20; killed 15; missed 5.

Mr. Snediker—10, 11, 10, 11, 11, 11, 01, 00, 01, 11—Total, 20; killed 14; missed 6.

SUMMARY.

SAME DAY—\$, 5 birds each, 21 yards rise, 80 yards

boundary, 1½ oz. shot, between Messrs. Griswold and Jones.

SCORE.

Mr. Griswold—1, 1, 1, 1, 1—Total, 5; killed 5.

Mr. Jones—1, 1, 1, 1, 0—Total, 5; killed 4; missed 1.

—The Staten Island Game and Shooting Association of Port Richmond passed the afternoon of Christmas day at turkey, chicken and pigeon shooting. Below we give the score of the pigeon shooting; sweepstakes at 6 birds each, 21 yards rise, and 80 boundary.

W. B. winning the gun.

There was also a match at Dexter's on Christmas day between W. B. and Mr. Bay, for \$25 a side, 25 birds each, 21 yards rise, etc. W. B. killed 22; Mr. Bay 20.

Immediately afterwards Mr. W. B. and Mr. C. Svea shot for \$25 each, W. B. giving five dead birds in 25. W. B. killed 21; C. Svea 13, leaving W. B. the winner; birds very good and a very gentlemanly affair throughout.

—The Sweepstakes of the Woodside Shooting Club on Wednesday Dec. 24th passed off in a very pleasant and satisfactory manner. The Sweepstakes was for a purse of \$50 at ten birds each, Long Island rules, 21 yards rise, 80 yards boundary, 1½ oz. shot, from H and T traps; 7 members were present to participate in the contest, accompanied by numerous friends of the club. The day was perfect and no accident occurred to mar the sport.

Referee—C. T. Howell, Jr.

MALAGA, N. J., Dec. 26th, 1873.

EDITOR FOREST AND STREAM:—

Will some of your numerous correspondents explain the relative merits of "Central," and "pin fire" breech-loaders? The writer, who has used a "Scott pin fire" for the past four years, finds, upon inquiry, at quite a number of "gun stores," both in New York and Philadelphia, that but comparatively few "pin fires" are now made. From what little we have seen of "Central fire" guns, it strikes us that the "pin" is a safer and preferable gun for general use. First, one can more readily see whether the shell is exploded—the projection of the pin being at once a guide, without unhooking the gun. Second, the construction of the "pin gun" is more simple. No spiral springs or plungers connected with it, as on the "Central fire," and consequently, less liable to get out of order. Third, when out of order, more readily repaired at any shop.

Will some advocate of the "Central fire" explain through your columns why it is that the use of the "Central" has become so fashionable as to render the purchase of (at times) a large quantity of pin shells very difficult.

Yours,

"PIN FIRE."

—An error occurred in the repetition of certain scores in our last number, which was so evidently a mistake of the types as to be manifest to all readers. We shall correct the same in a future issue.

Rational Pastimes.

Secretaries of University and College Athletic Clubs will please mail their reports not later than Monday in each week.

The remarkable weather of the early part of this winter is shown in the fact that the Boston base ball club played a game of ball on their grounds on Christmas day in the presence of about five hundred spectators. The contest was rendered unusually interesting, from its being played under the new rule of ten men and ten innings. The score is as follows:—Spalding's side, 16; H. Wright's side, 18. Time of game, one hour and fifty minutes.

—Skating was inaugurated for the season of 1873 and 1874 on December 29th, when the ball was run up at the Union and Capitoline skating lakes, Brooklyn. There will be good skating there all this week. All the public ponds are now giving an opportunity for recreation for these holiday times which young and old of both sexes eagerly avail themselves of. In Brooklyn a few sleighs have ventured out, but sleighing is indifferent in these parts, even in the suburbs. Only six inches fell last Saturday night, and the warm sun of the succeeding day greatly reduced its quantity and rendered it little available for runners.

—Our correspondents from the several Universities and Colleges have written us that owing to the deep snow they were obliged to postpone the foot ball matches and other athletic pastimes.

—The grand billiard tournament between Maurice Daly and Francois Ubassy was finished on December 27th, Daly being the victor. The fifth of the series of matches was played in the afternoon of December 27th, in Chris. O'Connor's billiard saloon, in Union square, being a game of 500 points up. It was won by Daly in fifty-seven innings, Ubassy only scoring 360 points. The sixth and last of the series of games came off in the evening of the same day, at the Spingler House billiard room, and resulted in another victory for Daly, who ran the game out on the thirty-seventh inning, Ubassy making only 236 points.

Yachting and Boating.

All communications from Secretaries and friends should be mailed not later than Monday in each week.

—The Bayonne Yacht Club, held its regular monthly meeting at 72 Beaver street, on the 25th of December. There was a large attendance of members, and several representatives of other clubs present. The occasion was for the distribution of prizes won by the members during the late autumn regatta. The following are the names of the yachts and owners who received prizes:—

1st. class sloop.—Qui Vive, Thomas Chapman, Bayonne Yacht Club—Club prize, large and elegant music box.

1st. class sloop.—Elizabeth, Commodore Tynon, Stapleton Yacht Club—Union prize, handsome large French bronze clock.

2d. class sloop.—Jeannette, Commodore Pearson, Bayonne Yacht Club—Club prize elegant music box.

2d. class sloop.—Eclipse, Captain McKinstry, Pavonia Yacht Club—Union prize, silver tea set, consisting of five pieces and salver, all handsomely engraved.

3d. class sloop.—Idle Hour, Thomas Taylor, Bayonne Yacht Club—Club prize, silver set, consisting of water pitcher, goblets, slop bowl and salver, all handsomely engraved.

3d. class sloop.—Joe Saunders, Frank Bates, Long Island Yacht Club—Union prize, large silver urn for ice water, elegantly engraved.

Bayonne, Mr. P. McGiehan, Bayonne Yacht Club—Prize won at regatta of the club, August, 1869.

After the presentation of the prizes the members sat down to an elegant collation. William T. Lee, John M. Sawyer, George Dunning and others responded to appropriate toasts. During the evening Captain G. A. Beling presented Joseph Elsworth with a handsome oil painting representing the last race of the Meta with the Vision, off Sandy Hook. Mr. C. C. Hough, President of the club, gave the painting to "Captain Joe," and the latter feelingly responded. The meeting was a grand success.

—General W. W. Sanford, of St. Louis, is building a new schooner yacht at Baltimore under the supervision of his sailing master, who formerly sailed his yacht the "Eddie." He is a practical sailor and boat builder, the schooner when finished will measure about 80 tons. A full description of this new schooner will appear in these columns in a future number.

—Com. W. H. Langley, of the "Addie," will build a schooner yacht this winter, providing he can make terms for the sale of his victorious sloop. The "Addie" is 52 tons new measurement, in complete order and could be made ready for sea in three days. She was built by Kirby, of Rye, N. Y., for John Voorhees and was formerly the "Addie V," and afterwards purchased by Mr. Langley, who won in one season some \$2,500 worth of silver plate.

COLLEGE BOATING MANAGEMENT.—The Freshman class is the largest that has ever entered Harvard; it by no means lacks good material for a crew, yet it seems in great danger of doing worse even than the last Freshman Class. The Class of '76 were at least enthusiastic, subscribing liberally to meet the expenses of their crew and having all winter long in the Gymnasium from ten to twelve men working for it; but our new associates seem entirely forgetful of the fact that the rest of the college expect them to send a crew to the next regatta. Yet perhaps I am wrong in this; perhaps the Freshmen are mindful of the fact, but think that all that is essential to success at the next race is to elect a captain, a man almost wholly ignorant of rowing, and to enter a crew in the fall races so good as to show that if proper measures are taken, the class can send out a crew which will retrieve the disgrace of last year.

That which is of the first importance, in entering upon the selection of a crew, is the choice of a proper man for captain. It seems incredible that the Freshman Class should, year after year, keep up the childish jealousy between the men fitted in Boston and those fitted elsewhere. It is a fact, I believe, that the election held last fall, so far from being a choice of the man best fitted for the captaincy, was merely a struggle between the supporters of two gentlemen who rested their claims upon the fact that one was fitted at a certain school and his competitor at another! The spirit that seems to actuate the men, as one of the members of the class is reported to have said, was this: "We don't care a straw for the office, but we want to defeat that man from ———." If this were not their first year in Cambridge, they would know that just such a spirit among the fellows has already greatly injured one or two Freshman crews; and members of the other classes fear that it will succeed in gaining another victim in the '77 crew.

To those who know anything about this class, and who have watched their crew, it is quite evident that there is no one among them fitted by knowledge and experience to

New Publications.

[Publications sent to this office, treating upon subjects that come within the scope of the paper, will receive special attention. The receipt of all books delivered at our Editorial Rooms will be promptly acknowledged in the next issue. Publishers will confer a favor by promptly advising us of any omission in this respect. Prices of books inserted when desired.]

SOUNDS FROM SECRET CHAMBERS. Poems. By Laura C. Redden. Boston: James R. Osgood & Co.

This is a nice little present for the holidays, in green and gold, and is in the form known as the semi-dramatic. It develops the plot of one of those love affairs that "never runs smoothly;" it is startling and tumultuous in all its parts. There is considerable merit in this little unpretentious offering, and some fine thoughts are here given. Our fair authoress says:

"I turn the key, I lift the lid,
I lay the casket on the sill,
And wistful linger at the door,
To know the tenor of your will."

We think a generous public will lift the casket and bid the bearer a cordial welcome to all the doubts and fears of a successful or unsuccessful future, which time alone will determine. "Sweet Bells Jingled" have some pleasant verses, as:

"How tenderly you meet the mute appealing
Of eyes that ever seek to read your own;
This clinging trust, this wild excess of feeling,
But, dearest, I have been so long alone,
Henceforth there is no good beyond my grasping,
No splendor that my earth-life may not take;
The passionate heart which to your own you're clasping,
Is henceforth sacred for your princely sake,
Lone one, beloved."

We find a goodly share of this little work devoted to the subject of kissing. We admit there is a poetry in kissing; we have boyish memories within which are garnered some sweet recollections of those days, yet we think some sixteen pages devoted to "kissing" a little too much. However, the poems give us the promise, with careful reproduction and some judicious pruning, to do good in the end.

SAXE HOLMES' STORIES. New York: Scribner, Armstrong & Co. Our readers will many of them recognize in this book some of the pleasant stories that pleased them at the time of their first publication in the *Scribner Magazine*. Like twice told tales they still have a zest and a refreshing for the memory of pleasant hours. The story of "Draxy Miller's Dowry," was an exceedingly quaint story, and if we mistake not, was extensively read and admired. We are happy to know that these stories are placed in a form more worthy still of the regards of the many friends of the "Scribner." These tales are remarkable for clearness and purity of thought, always anticipating our thought, never vitiated, we are happy to say, by either low taste or vulgarity.

WOMEN IN SACRED HISTORY. By Harriet Beecher Stowe. New York: J. B. Ford & Co.

The contents of this elegant and rare book are made up of sketches of women mentioned in Sacred History; both historical and legendary sources contribute quite largely to the same. Like all that Mrs. Stowe undertakes to do this work is done well, and adds a new lustre to her already acquired reputation as an authoress of the very first class. We know of no one more fitting to write an interesting and elaborate history of women under almost any era, than Mrs. Stowe, particularly of the Jews. She has given us a glimpse of women under what is called the patriarchal ages. Every Bible reader will be delighted to read her vivid sketches of Sarah, Hagar, Rebekah, Leah, and Rachael. We almost see them again in all their native costume and character moving before us. Many will turn to the Sacred Word with a deeper interest than they have ever felt before, as they peruse the history of another class of women under the cognomen of the "National Period." How grandly is the thrilling Eastern story of Queen Esther rehearsed; Miriam's beautiful history; Deborah, Ruth, and many others, whose lives are as types of the most interesting characteristics of women of the past ages. The history of that woman, Delilah, with her many blandishments, her arts of captivating the great, strong nature of Sampson, with all its highly wrought detail, *velut in speculum*, pass before us. Then the sweet, loving characters of the women of the Christian era. Mary, the Mother of Christ, the daughter of Herodius, the women of Samaria, Martha and her sister Mary, and last the repentant Magdalen, are all of them most graphically depicted. This work will stand as one of the gems of Mrs. Stowe's numerous improving educational works of the times. The high and elevated train of thought pervading this work makes it invaluable as an aid to Christian family training. This work is illustrated with sixteen chromo-lithographs, after paintings by Raphael, Koehler, Horace, Vemet, and others. A rare present, not only for the holidays, but for all times, is this great book of "Women of Sacred History."

RECENT MUSIC AND MUSICIANS, as described in the diaries and correspondence of Ignatz Moscheles. Edited by his wife, as adapted from the original German. By A. D. Coleridge. New York: Henry Holt & Co.

On the 30th of May, 1794, at Prague, was born Moscheles, even in his early childhood considered a great musical prodigy. His father, a merchant in easy circumstances, was a devoted lover of music and played admirably upon the guitar. His mother was a woman of great kindness of heart, affectionate and refined; one of those even tempered women who do so much to bless their own homes and make the world better around them. At the death of his father he was sent to Vienna to continue his musical studies. Here he made great progress and gave his whole heart to the most ardent pursuits of music in all its variety. The first entry in his diary—April, 1814—speaks with enthusiasm of Beethoven. An acquaintance with this great master results in his being chosen to arrange "Fidelio" for the piano. Of this little incident he thus speaks: "On going to see Beethoven early one morning, the great composer was still lying in bed; he happened to be in remarkably good spirits, jumped up immediately and placed himself, just as he was, at the window looking out upon the Schottenbastei with a view of examining the 'Fidelio' numbers I had arranged. Naturally, a crowd of street boys had collected under the window, when he roared out, 'Now what do those confounded boys want?' I laughed and pointed to his own figure. 'Yes, yes; you are quite right,' he said, and hastily put on a dressing-gown." Moscheles was eminently social and very genial in his life and intercourse with society. He speaks with rapture of Horace Vemet, and of an evening spent with the great ventriloquist. 1824 we find him nestled as a favorite guest with the Mendelssohn family, and ever after these two families entertained for each other the most profound friendship. About this time he became acquainted and greatly pleased with Maria Garcia, afterwards Malibran. He says in his journal: "This charming girl, almost a child, acted enchantingly in the 'Chauvin de Reims,' 'Le Coin de Rue,' and 'L'Orme de la Pacha.'" In course of his work he speaks of Sontag as "young, beautiful, fascinating." As a most entertaining and valuable biography, a diary of a great man, we recommend this work to all our musical friends as one of great intrinsic value.

HANS BRINKER; or The Silver Skates. By Mary Mapes Dodge. Illustrated by Darley, Nast, and others. New York: Scribner, Armstrong & Co.

The mere announcement of such an elegantly illustrated work by such artists; the fact that it is Scribner's tasty style, would seem to be all that is necessary to say about this gem of the Christmas morning or New Year's day. We will only add our appreciation of this elegant book, always new, and just what Santa Claus will delight in presenting to hundreds of the young ladies and gentlemen of all our cities. It is overflowing with rich and quaint stories of early life, told with a sweet simplicity and earnestness that makes them really charming.

THE CROSS OF BERNY; or Irene's Lovers. A Novel. By Madame Emile de Girardin, M. M. Theophile Gautier, Jules Sandeau, and Mery. Phila.: Porter & Coates.

Literary partnerships have often been tried, but not always with the success attending the execution of such a work as the "Cross of Berny." This the reader will find a perfectly simple story, told without elaborate ness, yet is in all its parts a perfect whole, a finished work. The original preface to the French edition says: "The 'Cross of Berny' was, it will be remembered, a brilliant tourney, where Madame de Girardin *nee* Delphine Gay, Theophile Gautier, Jules Sandeau, and Mery broke lance like valiant Knights of old." They were then considered as the four most brilliant of our celebrated cotemporary authors. Such a book from such a source may well command the attention of American readers. It is admirably translated, preserving all its peculiarity of structure. We are surprised to take up a work the joint effort of four writers, and find so complete a unity in the whole. The correspondence is well sustained from the first page to the last. By this plan of arrangement the individual or *personnel* of each writer is separate as a part, and the union complete and interesting as a whole.

THE MARVELLOUS COUNTRY; or Three Years in Arizona and New Mexico, the Apaches' Home. By Samuel W. Cozzens. 8vo. Boston: Shepard & Gill.

A fruitful and interesting theme for the traveller in the marvellous country spoken of in this work. It is by no means a dull book; it were impossible for such a man to roam through such a country as that known under the title of the Great Arizona, especially since its acquisition by this country, and not give us a work of merit. We think, however, that our author could have made a still better work with the materials he had had he dwelt less on incidental topics. The work could well spare "all about Jimmy," and not suffer in our estimation. But the excellent character of the book will at once be recognized by every lover of the travels in Arizona. It was undoubtedly the Cibola, or land of the Montezumas, and is like an enchanted land. This mysterious region long years ago, before it was conquered by the adventurous Spaniard, was known for its exceedingly rich silver mines, many of which, it is still believed, have never yet been found and are at this day rich in untold wealth. Mr. Cozzens' "Arizona" is the best work we have seen upon this wonderful country, and we think it deserving a place in the library of every student. There is life in the work, and camping out and its incidents, breaking camp, and stories by the way, make the book a valuable guide to travellers in that romantic region.

PAINTERS, SCULPTORS, ARCHIECTS, ENGRAVERS, AND THEIR WORKS. A Handbook. By Clara Erskine Clement. With illustrations and monograms. In one volume, crown, 8vo, cloth, \$3.25. Cambridge: Hurd & Houghton.

Every person who buys the Grammar of Painting and Engraving should possess this companion volume. It is a well and copiously interwoven series of facts which every artist will find very useful and very necessary as an aid to his profession. It is like a complete *index revum* of the art student, and, like the large dictionary for literary men, should lie upon every art student's table. It gives one the history of the artists who wrought these beautiful pictures; it places their peculiar style; it speaks of the several schools to which they severally belong in a manner altogether new to many of our well informed admirers of the works of our old masters. Its numerous illustrations make very easy to understand much of what without them, would be like the unknown tracings of an unknown hand.

THE BIRDS OF NORTH AMERICA. By Theodore Jasper, A. M., M. D. Drawn from life, one-quarter size of life. Robert Clarke & Co.: Cincinnati, Ohio.

We have received from the publishers the four first parts of this large and finely illustrated work upon the birds of North America. Each part will be made more valuable by the addition of three accurately colored plates and one tinted scientific plate, 12x15 inches, together with eight pages of magnificent, clear, open type letter-press, on finely tinted paper. In this work, of which the great value may be judged, there will appear illustrations of over six hundred species of birds, comprising all that are known to exist on this continent. To this is added popular descriptions of the well known habits of life on the plain, on the crag, in river, beside the lakes, and neath the deepening shadows of the dark wood. Everything relating to the bird spoken of is truly told and with all the fidelity of a life study by the author, whose fame as a naturalist and ornithologist is not surpassed by any living man of the day. This work is the crowning effort of the life of the author, whose entire life has been spent in the study and preparation of this great work. So careful was the author, Dr. Jasper, to give a true picture of the specimen under his hand, that he was not content with the delineations of an hired artist, but learned the art of engraving in this peculiar style and coloring, so that he might give to his readers and subscribers the handiwork literally of his own pencil, every specimen here presented being drawn by himself. Differing entirely from most works upon this subject this great work comes to us perfect in all its parts, elaborate and highly finished, as an art, true to life as a great advance in the science of Ornithology; in several respects we regard it superior to Audobon's great work on "Birds of America," published some years ago. This may seem quite a strong expression on our part, yet we believe, upon looking critically at this work of Dr. Jasper's we shall by no means stand alone in our judgment of the great merits of the book. Of one thing we are convinced; so many desirable points of beauty and fidelity can rarely be found in this country at such a reasonable price. Who will not pay one dollar per part for such a work as the above?

THE LAWRENCES. A Twenty Years' History. By Charlotte Turnbull. Boston: American News Co.

This is one of those books that one is repaid the reading. Its characters all are drawn from stirring events that transpired during the eventful period of the Mexican war and the War of the Rebellion. Leaving these far off fields of Mexico and the Southern battle fields, with all their stirring memories and strifes, our authoress transports her readers to the quiet of one of New England's villages—Brookfield. We open this book amid the din and smoke of the battle-field, the clash of arms and exciting events all of which are graphically and many of them historically correct. This work is morally a good teacher, and may be read with profit by any one. We prefer to place the book, with these remarks only, in the hands of our readers without further analysis.

FRENCH HOME LIFE. New York: D. Appleton & Co. have just published a series of racy papers, part of which has appeared in *Blackwood's Magazine*. They should have been published in this form before. We recommend these stories earnestly to the readers of Appleton's best books as every way valuable. They are the jottings of a close observer, the result of the careful observations of an English tourist in France, whose opportunity for seeing all the sights were very favorable for his observations. Any one who reads the book will feel that he has made good use of his eyes as with his pen. Being written in a reliable manner, the pictures of French life are real and not fictitious. The book will be like a new revelation to many, of facts they knew not of before the reading of this work. The work is one that can be read with profit and pleasure, as many topics are fully treated that may be of much use to a future sojourner in France.

—Hon. Alex. Keith, President of the Legislative Council of Nova Scotia and Grand Master of Masons of that province, died on Sunday, aged 78.

—The winter trots under the auspices of the Trenton Club, Ontario, Canada, come off at that place on the 8th and 9th of January, when an attractive little programme will be hung up.

train a crew during the winter and coach them in Gymnasium; and I think I may venture to say that to most of those men the following seem the best plan that can be followed: There are several fellows, who have been here a year or more and who have pulled during that time, who it is thought would be willing, if asked by the class, to choose a number of men, train them during the winter, and teach them all that can be learned on the rowing weights. When the spring comes, the trainer might take them on the river, going himself as coxswain, and assign to them their positions in the boat as should seem to him best. As soon as the crew are fairly at work, let the members elect one of their number captain, and while he would have full command over the men, the trainer might still go out for the purpose of giving them style. It seems to me to be proved conclusively by the blunders of '75 and of '76 that a class as a body knows nothing about the qualities requisite in a captain of a crew; and it is well known to any one who has ever pulled that it is soon evident to the crew which of their number is best fitted for captain.—*Cambridge Magenta.*

—The *Detroit Free Press*, of recent date, says:—"Sunday morning, two farmers and their families, who were driving to Malden to attend church, noticed, when about eight miles below, or east of the town, a ship's yawl on the lake, heading toward the beach, and about half a mile away. They could plainly make out a man in the stern sheets steering the boat with an oar, and, although there were no vessels in sight, the morning was so pleasant and the sea so smooth, that it was supposed that the man had put out from shore to pick up something, and but little attention was paid to the yawl. Passing the same spot on their return the men found the yawl hard on the beach, and the man was lifeless and frozen as hard as a rock. He sat bolt upright on the seat, the oar out behind, and both hands clasping the handle, and it required hard work to wrench it from his death-grip. There was about a foot of water in the boat, but the craft did not show rough usage. The man's legs were almost covered with ice as far up as his knees, and the spray had dashed over his back and shoulders and frozen there. There was no name on the boat, nor anything on the man by which he could be identified."

Art and Drama.

GOSSIP OF THE WEEK.

BY T. B. THORPE.

THE holiday week has been signalized by some very stormy weather. Friday and Saturday last was at a premium in this respect. Lectures and "small amusements" suffered intolerably, and afforded little else than empty seats to be addressed by the parties interested in their success. The leading theatres, however, were maintained with generous patronage, their interiors looking more than ever cozy and attractive from contrast with the sleet and slush outside.

—"A Man of Honor," which is the new feature at Wallack's, is capitally acted, and draws full houses. In this play the unrivalled company attached to this theatre find apparently the very best places for the development of their especial talents. The scenery is most perfect, and continually calls forth demonstrative admiration from the audience; in some scenes the imitations of the "real thing" amount to an absolute delusion. The rapid advance in this city within a few years in regard to scenic effect has been very marked and wonderfully successful. In the matter of landscape and architecture there are presented by the artists in their work combinations of colors, scientific drawing, knowledge of striking and harmonious contrasts that display an amount of natural ability and severe study we do not meet with in the best efforts from the easel. This is especially true of landscape painting—the forte, as it is understood, of the occupiers of the studios.

—"Led Astray" continues to be a great favorite at the Union Square. If it falls off in interest at all it will be owing largely to the fact that the universal press has quit scolding and condemning the questionable insinuations of the plot.

—On Saturday, one of the most disagreeable days we ever knew that was not devoted to the rehearsal of a terrible storm, the matinee of "Aida," at the Academy of Music, was attended by one of the largest and best dressed audiences that has appeared before the footlights this season. The opera grows more and more popular on each presentation.

—Thomas' Symphony Concerts are liberally patronized. The programme, as usual, is addressed almost entirely to highly cultivated musicians, and certainly very little that the general public care to hear. We congratulate the spirited leader upon his pertinacity in sticking to his "classics," but for the sake of the million we wish we had musical concerts that would not only give us sweet sounds, but cheer and enliven and interest us without taxing our brain and over-wrought mind. We would mention in this connection that Gilmore's promenade concerts have been announced to continue "through the season." They are liberally patronized, and by the best people. Surely, there is a strong feeling in our community to hear concords of sweet sounds from brass and stringed instruments. How soon ~~are~~ we to have a proper building down town for these entertainments?

—Are blacksmiths who make a living by forging, or carpenters who do a little counter-fitting, any worse than men who sell iron and steel for a living?

—Chicago wants to have the "next world's fair" held there. But who knows whether the next world will have a fair?

—A true Danbury American is too proud to beg and too honest to steal. He gets trusted.

A discount of twenty per cent. for five copies and upwards. Any person sending us two subscriptions and Ten Dollars will receive a copy of Hallock's "Fishing Tourist," postage free.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices 50 cents per line. Advertisements in double column 25 per cent. extra. Where advertisements are inserted over one month, a discount of 10 per cent. will be made; over three months, 20 per cent.; over six months, 30 per cent.

The object of this journal will be to studiously promote a healthful interest in outdoor recreation, and to cultivate a refined taste for natural objects. We especially desire to make the FOREST AND STREAM the recognised medium of communication between amateurs and professional sportsmen. All of us have something to impart, which if made available to each other, will in time render us proficient in all those several branches of physical culture which are absolutely essential to our manhood and well-being, both as individual men and as a nation. A practical knowledge of natural history must of necessity underlie all attainments which combine to make a thorough sportsman. It is not sufficient that a man should be able to knock over his birds dexterously right and left, or cast an inimitable fly. He must learn by study and experience the haunts and habits of the game or fish he seeks. If he depend altogether upon his dog's nose, or upon his henchmen, he will some day have to retire from the field in mortification and disgrace. Therefore it is that we shall study to give practical instruction in the most attractive departments of natural history. We shall not forget the technicalities of the craft either, but take pleasure in designating the best localities for hunting and fishing, outfits, implements, remedies, routes, distances, breeds of dogs, &c. Each number will contain a paper descriptive of a particular animal, bird, or fish, with some instruction as to its habits, haunts and mode of capture, and the period when it is in season. We have arranged to receive regular weekly reports, of the fishing and shooting in various parts of the country.

Yachting and boating will be encouraged, and yacht news be made an especial feature of the paper. A reasonable space will be given to athletic sports and those out-door games in which ladies can participate. In a word, every description of game that is in vogue among respectable people, and of value as a health-giving agent or recreative amusement, will be considered and its practice encouraged. Nothing that demoralizes or brutalizes, nothing that is regarded as "sport" by that low order of beings who, in their instincts are but a grade higher than the creatures they train to amuse them, will find favor in these columns.

To horse news we shall devote some space, giving a record of leading races and meetings and current events, but we shall not make it a feature of this journal. We leave this department to others, much more competent than ourselves, who are recognised throughout the country as exponents of the turf, and as authority in stock, pedigree and kind. We yield to no one, however, in our love and appreciation of the horse and his estimable qualities. The noblest of all animals, and the companion alike of men of high and low degree, he has never become contaminated by the moral atmosphere by which he is often surrounded, or degraded below the high rank to which his attributes entitle and assign him.

To the forest, lawn and garden we assign full place. For the preservation of our rapidly diminishing forests we shall continually do battle. Our great interests are in jeopardy—even our supply of drinking water is threatened, from the depletion of our timberlands by fire and axe. It is but proper to state here that the gentleman in charge of this department is the well-known "Olipod Quill," who was connected with the *Agriculturist* newspaper from the start, and a co-laborer with the lamented Downing for many years. Much valuable information will be found in this department.

Our military department is intended to comprise merely a weekly summary of news for officers and soldiers upon the frontier—such news as the castaways would enjoy to receive in a "letter from home;" and we trust that many of them will be inclined to send us in return some account of their hairbreadth experiences among the Indians, the buffaloes, the grizzlies and the antelopes. We of the East are not thoroughly familiar with the varied species of game in the far Northwest, and would like to receive full information especially of the numerous *Cervus* family and of the Rocky Mountain sheep. This department is under the charge of a distinguished army officer.

Our dramatic and art column will be prepared by Colonel T. B. Thorpe, and must at once become popular with all our readers who are interested in these matters. We shall occupy an independent position and throw our efforts in behalf of competent reform. We shall perhaps even *clamor* for it.

Our columns will always contain the cream of the latest foreign sporting news.

In a word, we are prepared to print a *live* paper and a useful one. We shall not be parsimonious in securing the best material for its columns. We are convinced that there is a standard of eminence and usefulness not yet fully attained by any sporting journals in this country. To this we aspire. It will be our ambition to excel; and we have relinquished a life of ease and semi-indolence to take charge of the enterprise. This not of our own free choice, but at the solicitation of many hundreds of friends and strangers. We are ably assisted in our labors by a corps of valuable associates—men of age and experience, all of whom, with single exception, have been identified with leading journals for years.

Mr. SIMON A. ATKINSON, connected with the Georgia press for over twenty years, has charge of the business affairs of the Company.

CHARLES HALLOCK, Managing Editor.

Publications

THE TWO SUCCESSFUL BOOKS OF THE SEASON.

I.

Hallock's Fishing Tourist,

The Fishing Tourist, Angler's Guide and Reference Book.

BY CHARLES HALLOCK,

Secretary of the "Blooming-Grove Park Association"

ILLUSTRATIONS, CROWN 8VO., CLOTH \$2.00.

Mr. Charles Hallock is one of the few gentlemen who write a book mainly for the reason that they have something to write about—have something to tell the public which the public desires to know. The shortest routes to pleasure are laid down, and correct information is given as to the best means of conveyance, the expense of the trip, the secrets of the commissariat, etc. The author has avoided the use of technical terms, and thus made his volume all the more acceptable.—*Turf, Field and Farm*.

II.

Prime's I Go A Fishing,

I Go A Fishing, by W. C. PRIME, author of "Boa Life in Egypt," "Tent Life in the Holy Land," etc.

CROWN 8VO, CLOTH, BEVELED EDGES, \$2.00.

It abounds in pleasant episodes, charming and vigorous descriptions of scenery and character, is distinguished by a refined wit, a droll humor, a strong love of the beauties of nature, and an enthusiastic devotion to the piscatorial sport. This book will please all who admire heartiness of style and exuberance of animal spirits in their authors. There are some interesting and well-told stories scattered through the volume, which exhibits on almost every page the handiwork of a man of graceful culture and wide reading.—*Boston Daily Globe*.

Published by Harper & Bros., N. Y.

HARPER & BROTHERS will send either of the above works by mail, postage prepaid, to any part of the United States, on receipt of price.

GENTS WANTED, everywhere, for
Inside Life in
A Wall Street.

By Wm. W. Fowler, Wall Street Correspondent of Boston COMMERCIAL BULLETIN, and an operator of 18 YEARS EXPERIENCE. The best-selling book published. Gives the Histories, Mysteries and ways of the Street, and tells of all the great Rises, Panics, Ranges, &c., including BLACK FRIDAY 1869 and SEPTEMBER 1873. The ONLY COMPLETE WALL STREET Book ever written. Beautifully illustrated. Every man and woman wanting employment should send for our illustrated circulars. DUSTIN, GILMAN & CO., Hartford, Conn.

The Sanitarian.

A. N. BELL, M. D., Editor.

OPINIONS OF THE PRESS.

"The Sanitary question is now uppermost in the public mind, and it is gratifying to see that the discussion of it is not going to be kept as a 'mystery' in the medical profession. Every human being is concerned in this matter; and if sanitary science has any suggestions to make, they must be made directly to the people themselves. This is what the periodical before us aims to do, and this it is doing well."—*Popular Science Monthly*.

"As its name implies, THE SANITARIAN is devoted entirely to Sanitary Science, in its liberal and proper sense. The field it occupies is a most important one, and the editor admirably qualified for the work he has undertaken."—*Medical Examiner*.

"Consistent with his announcement, Dr. Bell seems to have spared no pains to secure for the Journal the continued approbation of the public, by treating, in a clear yet comprehensive manner, of subjects with which the public are directly interested, and the importance of which cannot be overestimated."—*Appleton's Journal*.

"This is a Monthly Journal, containing original essays on various Sanitary topics, by some of our most prominent medical scholars, popular enough to be read with profit by every person who reads, and learned enough to be of great interest to medical men. It ought to be read and preserved by every family, because it teaches how to avoid numerous causes of disease, and to support health and vigor."—*The Israelite*.

"A thorough-going Health Journal—not the cheap popular thing which generally goes current under that title, but a substantial register of Sanitary knowledge and science."—*Christian Standard*.

"Of a much higher grade than is common to our health publications."—*Watchman and Reflector*.

"THE SANITARIAN ought to be in every family on account of the practical common sense manner in which it treats questions of public and private health."—*The National*.

Annual Subscription, \$3 in advance. Single copies, 30 cents.

All communications intended for publication, including advertisements, books for notice, or subscriptions, should be addressed:

New Publications.

APPLETON'S
American Cyclopaedia.

NEW REVISED EDITION.

Entirely re-written by the ablest writers on every subject. Printed from new type, and illustrated with Several Thousand Engravings and Maps.

The work originally published under the title of THE NEW AMERICAN CYCLOPAEDIA was completed in 1863, since which time the wide circulation which it has attained in all parts of the United States, and the signal developments which have taken place in every branch of science, literature and art, have induced the editors and publishers to submit it to an exact and thorough revision, and to issue a new edition entitled THE AMERICAN CYCLOPAEDIA.

Within the last ten years the progress of discovery in every department of knowledge has made a new work of reference an imperative want.

The movement of political affairs has kept pace with the discoveries of science, and their fruitful application to the industrial and useful arts and the convenience and refinement of social life. Great wars and consequent revolutions have occurred, involving national changes of peculiar moment. The civil war of our own country, which was at its height when the last volume of the old work appeared, has happily been ended, and a new course of commercial and industrial activity has commenced.

Large accessions to our geographical knowledge have been made by the indefatigable explorers of Africa.

The great political revolutions of the last decade, with the natural result of the lapse of time, have brought into public view a multitude of new men, whose names are in everyone's mouth, and of whose lives every one is curious to know the particulars. Great battles have been fought and important sieges maintained, of which the details are as yet preserved only in the newspapers or in the transient publications of the day, but which ought now to take their place in permanent and authentic history.

In preparing the present edition for the press, it has accordingly been the aim of the editors to bring down the information to the latest possible dates, and to furnish an accurate account of the most recent discoveries in science, of every fresh production in literature, and of the newest inventions in the practical arts, as well as to give a succinct and original record of the progress of political and historical events.

The work has been begun after long and careful preliminary labor, and with the most ample resources for carrying it on to a successful termination.

None of the original stereotype plates have been used, but every page has been printed on new type, forming in fact a new Cyclopaedia, with the same plan and compass as its predecessor, but with a far greater pecuniary expenditure, and with such improvements in its composition as have been suggested by longer experience and enlarged knowledge.

The illustrations which are introduced for the first time in the present edition have been added not for the sake of pictorial effect, but to give greater lucidity and force to the explanations in the text. They embrace all branches of science and of natural history, and depict the most famous and remarkable features of scenery, architecture and art, as well as the various processes of mechanics and manufactures. Although intended for instruction rather than embellishment, no pains have been spared to insure their artistic excellence the cost of their execution is enormous, and it is believed they will find a welcome reception as an admirable feature of the Cyclopaedia, and worthy of its high character.

This work is sold to Subscribers only, payable on delivery of each volume. It will be completed in sixteen large octavo volumes, each containing about 800 pages, fully illustrated with several thousand Wood Engravings, and with numerous colored Lithographic Maps.

PRICE AND STYLE OF BINDING.

In extra Cloth, per vol.	\$5 00
In Library Leather, per vol.	6 00

TO SPORTSMEN.

CHAMPION POINTER

"BELLE."

The artistic portrait of this REMARKABLE ANIMAL has been enlarged by a celebrated animal painter of this city, afterwards cut on stone by the American Photo-Lithographic Co. The size of the dog is 6x4 inches, mounted on superior card board. The Pedigree and points made in the late great field trials for all aged Pointers and Setters is also engraved. Altogether this will make a fitting present from one sportsman to another as a holiday gift.

[The new Tribune Building stands upon the old site, and will be the largest newspaper office in the world. It will be nine stories high, and will cost, exclusive of site, one million dollars.]

New-York Tribune.

The Leading American Newspaper.

"NEVER SO GOOD AS IT IS TO-DAY."

The unlimited and unsolicited verdict of the hundreds of thousands of readers of THE TRIBUNE, is that the paper was never so good as at the present time. During the past year it has enlarged its field and improved its facilities in every direction, and enters upon the year 1874, which is to be one of the most important in public and political affairs, with most encouraging prospects. THE TRIBUNE, however, believes in deeds rather than in words, in results rather than in promises. It points to its record and its columns for the past twelve months as the best evidence of what it has done, and the most satisfactory pledge of what it will do. All the distinctive features of the paper will be preserved and strengthened; the "Extras," whose sale has reached hundreds of thousands, will be continued; the front of its new building completed, and the present admitted pre-eminence of the paper, not only maintained, but still further advanced.

As an invaluable paper for the Farmers of the whole country THE TRIBUNE fully maintains its well known and admitted position. It publishes much more matter of interest to Farmers and their families than any of the strictly "agricultural" papers, and no Farmer can afford to be without it unless he can afford also to be without all the market reports—cattle, grain and produce—information of agricultural events and progress, and all the general news of the day. To every intelligent Farmer THE TRIBUNE is simply indispensable.

TERMS OF THE TRIBUNE.

DAILY, (by mail), one year, \$10.
SEMI-WEEKLY, one year, \$3; five copies, one year, \$12.50; ten copies (and one Extra), one year, \$25.
WEEKLY, one year, \$3; five copies, \$7.50; ten copies, \$12.50; twenty copies, \$22, and thirty copies, \$30.
Each person procuring a club of ten or more subscribers is entitled to one extra WEEKLY, and of fifty or more to a SEMI-WEEKLY. Papers addressed separate to each member of clubs will be charged ten cents additional to the above rates.
Specimen copies of either edition of THE TRIBUNE sent free on application.

Terms invariably Cash in Advance.

Remittances at sender's risk, unless in registered letter, by draft on New York, or postal money order.
Address: **THE TRIBUNE, New York.**

THE TRIBUNE EXTRAS.

Extra sheets issued occasionally, and containing the latest and best things in art, science, literature, history, and religious discussions. Half a million already sold. The series of fourteen Extras now published sent by mail to any address in the United States for One Dollar. Additional Extra sheets, containing the two recent novels, "May," by Mrs. Oliphant, and "Lords and Ladies," each by mail ten cents. Descriptive circulars, giving full details of the contents of each Extra, sent free on application.
Address: **THE TRIBUNE, New York.**

Sportsmen's Goods.

This Rifle, after being tested in the severest manner by the late Board of U. S. Officers, appointed by the Government to select the best arm for the service; and after examining over one hundred different systems, including the best guns of Europe, say of it, "that it is the best rifle they have seen, or of which they have any knowledge. They therefore recommend it for trial in the hands of the troops. A seven pound carbine on this plan, with coarse military sights, has made better targets at Creedmoor the past summer, than the best English and American target Rifles weighing 10 pounds and having peep and globe sights.

We are now making these guns to supply the numerous demands, and will soon have them in the market.

The following is our scale of prices:—
SPECIAL MAGAZINE RIFLE for large game, carrying from 3 to 8 cartridges, 70 to 85 grs. of powder, 350 to 400 grs. of lead, 8 to 10 lbs. weight.....\$60.00
and upwards, according to finish.

SPECIAL LONG RANGE MAGAZINE RIFLE for Creedmoor shooting, 90 grs. of powder, 480 grs. of lead, carrying 3 to 8 charges, weight, 10 lbs. from.....\$100
and upwards.

MAGAZINE RIFLES for general use. Carry 3 to 9 cartridges. 60 grs. powder, 350 grs. lead.....\$40.00
and upwards.

SINGLE BREECH LOADERS for long range Creedmoor shooting, 90 grs. powder; lead, 480 grs., from.....\$60.00
and upwards.

SINGLE BREECH LOADERS for general use, 6 to 7 lbs., 60 grs. powder, 350 grs. lead, from.....\$30.00
and upwards.

The calibre of all our rifles, unless otherwise ordered, will be .45-100.

All communications should be addressed to

BETHEL BURTON,

Cut Cavendish Smoking.

Ask your Dealer, or send direct to our works for a supply of the best Tobacco.

A Foreign Testimonial.

The following Testimonial shows what the "Vanity Fair" Smoking Tobacco is thought of abroad. It received the first prize at the Vienna Exposition:

VIENNA, Austria, Nov. 30th, 1873.

Messrs. W. S. Kimball & Co.:
Sirs—A friend of mine sent me with transport of Indian skulls two pounds of "Vanity Fair," which I declare to be the best tobacco I ever smoked. We have very good tobacco in Vienna—Turkish and Hungarian—but "Vanity Fair" is the king of all, by its aromatic flavor and the right sort of strength.
If there is a German firm which sells your excellent "Vanity Fair," I beg you to enclose the address in the box. Your respectful servant,
DR. JOS. HYRTL.
Professor of Anatomy in the University of Vienna.

REMINGTON'S

Sporting, Hunting and Target
Breech-Loading

Rifles and Shot Guns.

Long Range Match Rifles for "Creedmoor" Shooting, now ready. The same as won the "Turf, Field and Farm" Badge, Aug. 2, and "Amateur Rifle Club" Badge, Aug. 9. See reports. Unequalled for accuracy by either Breech or Muzzle-Loaders of other makers.

For simplicity of mechanism, ease of manipulation, quality of workmanship and material, accuracy of range, and penetration, WITHOUT COMPARISON.

"It is a noteworthy fact that though many different kinds of rifles were used in the several matches, including the converted Springfield, Remington, Metford, Ballard and Ward Burton Rifle, every prize in all the matches was won by those who fired with the Remington rifle, except the last."—From N. Y. Times, June 22, 1873.—(See full report.)

The Remington Rifle won Twenty-two out of Twenty-three Prizes at

the Creedmoor Meeting,
June 21, 1873.

THE FLOWER'S REVENGE.

[FROM THE GERMAN.]
BY E. C. G.

On a couch of downy pillows
Lies a maiden, sleep beguiled,
On her cheeks the color flushing.
Veiling dreams beneath her eyelid.
Poised upon its costly salver,
Sways a chalice heaped with flowers.
Wafting incense, dreams and perfume
On the slowly passing hours.

Laden with the fragrant message,
Heavy hangs the air above her;
Hardly stir her cloudy tresses
In the summer winds that love her.
Through the silence, dim and dreary,
Suddenly a quaint voice calleth:
Quick from flow'ret and from leaflet,
Soft and low an answer falleth.

From the white and gay corollas
See the flower spirits springing,
Wrapt in rolls of sheeny splendor
Crowns and spears in order bringing.
From the roses' crimson bosom
Shyly smiles a queenly maiden,
Lightly float her airy tresses,
That with dewy pearls are laden.

From the rare old helmet-blossom,
With its leaves of sombre blue-green,
Leaps a warrior, clad in armor,
Face and name doth visor screen.
Waves a long plume from his helmet,
Rivalling the snow in whiteness;
And the lily wafts his fair bride,
With a veil of cobweb lightness

From the tulip's rainbow chalice
Starts an Arab, garments flowing,
And upon his swarthy features
Fierce the desert strength is glowing.
From the tiger-lily's petals
Steps a hunter of the wild chase;
And the deep blue Iris blossom
Yields up satyrs of the wood race.

From the bed of the narcissus
Wakes a youth with raven tresses,
Swinging upward to the sleeper,
Kisses her and wildly presses.
Quickly haste, then, fauns and fairies,
Each to kiss or clasp the sleeper.
Yet their singing and their sighing
Only makes her rest the deeper.

"Maiden," sing they, "earthly maiden,
Rudely have you nipped our blooming;
In this silver fretted prison
All our beauty we're entombing!
Oh how happy in the brown earth
Did we live thro' early spring time!
Then the golden sunlight—starlight,
Made the soul of leaf to leaf chime!

"All the loving winds and zephyrs
Swayed our blushing petals gladly;
And at night in fairy circles
Did we dance and warble madly;
Dews and rains withheld no blessing;
Now we droop and pine in sorrow;
Yet before we fade and perish,
Strength for vengeance we will borrow!"

Silence reigns among the fairies,
As they light upon the sleeper;
All the air is heavy perfume,
Yet the maiden's dreams grow deeper.
What a rustling! what a sighing!
How the maiden's cheeks are burning!
How the spirits keep on breathing,
Heedless of her restless turning!

When the sun uprose in splendor
Spirit and fairy faded slowly,
On the couch they left the maiden
Deeply sleeping, sleeping wholly!
Like a withered blossom lying,
With the color paling faintly—
Did their vengeance curse or bless her?
For her rest is deep and saintly!

Hunting Deer in Minnesota.

ONE DAY'S SPORT.

BRAINARD, Min., Dec. 24, 1873.

EDITOR FOREST AND STREAM:—

A few days ago, feeling that the monotony of the office was wearing heavily upon me, I threw my trusty "Wesson" on my shoulder and started for a brushy marsh some three miles south-west of town. The snow lay full ten inches deep, with no crust. The barometer indicated a change in the weather, wind blowing from the south-west, the atmosphere moderately temperate for a winter day, and clouds obscuring the sun. This being the second day after quite a storm of snow, with the thermometer above the freezing point, Old Probabilities suggested to me that this was a very favorable day to be in the woods. I moved along against the wind leisurely, stopping every now and then, scanning objects critically, and watching for "signs." After about an hour's walk, just on the edge of a little area of brushy land, I discovered two fresh tracks. A careful examination satisfied me, first, that these tracks were made by fawns; secondly, that they had been feeding on this brush, and thirdly, that the tracks being fresh, the deer could not be far away. I took a careful survey of the whole visible surroundings, but saw nothing. I made motions very slow after this. When I lifted a foot forward, backward, right or left, my body was erect, and swayed almost imperceptibly; in fact, getting along at a snail's pace, ten rods in as many minutes, and leaving no possible depression or elevation of ground unexamined at each yard of advance, eager and still careful, active but slow, I moved along through the brush, and looking across a small marsh, on slightly rising ground, fifty paces away, I saw my game, head down, and as unconscious of danger as the wind itself. I was in no hurry. And what a splendid mark! In a twinkling my rifle pointed at the attractive shoulder of the fawn. I knew it, because I saw that shoulder through the sights; and, as I saw, my finger, responsive to the sense, bore three pounds on the trigger, a report, and, as the smoke lifted, the fawn raised her flag, leaped twenty feet in a direct line forward, and was off like the wind, wild, free and unhurt. I spent no time, however, in mourning over this result. I ran up to the place where the fawn had stood, throwing in a cartridge as I ran, and looking across another marsh, 150 yards away, saw the one I had missed so handsomely and its mate, with heads erect, ears working back and forth, snuffing the air for any stray tell-tale scent, looking as only deer can look when realizing impending danger, yet unconscious from whence it may come. With one glance I took in the situation, and at the same instant a thrill of immense satisfaction appealed to my consciousness. Fun ahead! thought I, as the sight played along the barrel, on a direct line with one of them, and the unerring ball sped on its urgent mission. Down went the flag and down dropped the fawn on the feathery snow. "Ah, ha! my fine fellow. You dodge another ball at fifty paces, eh?" Then I threw in another cartridge, drawing a straight line, and resting the farthest projection on the shoulder aforesaid, I clattered away and down went fawn No. 2, and I knew by the way he fell, stone dead. At this report, fawn No. 1 jumped to her feet, cast one look at her fallen brother, came over towards me twenty paces; but her wound was a terrific one, and wearied with her efforts, she, too, dropped to mother earth, quite dead. Ah, a proud moment is such an occasion to the genuine hunter! No statesman, hero or warrior, ever felt a greater degree of the ennobling, exalted "influence" than I did at that particular time. If it could but abide with me!

I continued my hunt for about 200 yards and struck another fresh track. The other deers were hung up safely in trees. Within five minutes I discovered a deer walking leisurely along—some 300 yards in advance. I did not like to risk a shot this distance, while the chances were favorable to my getting nearer. She was moving with the wind, and to avoid permitting her to get the wind of me, I made

a short hasty circuit, and stole up to the place where I last saw her. She had entered a small patch of brush; and, after examining the ground beyond, I was satisfied my game was lying down in this brush, and not fifty paces distant. My only hope rested now on a shot at her "on the fly." Bringing my rifle to my shoulder, and whistling softly, the fawn, instead of raising up quickly to see what was up, had winded me, and with a mighty leap over brush, flag up, and really frightened, promised to distance all pursuers. As she was in the air on her third leap, I spoke to her through my powder trumpet plainly, "stop." She only partially obeyed. I had caught her on the point of a ball just under the right flank, the ball ranging forward, crashing through the left shoulder, entirely disabling it; and yet in this terrible predicament, she led me a race of a mile, dodging behind trees, lying down behind logs and peering over the top, always on her guard, and anticipating my approach before I could sight her. But bleeding badly, she finally became weak, and at last turned on her course, came back to meet me, and within three paces, lay down nearly at my feet, tame and docile as a cosset lamb that has been wont to take its food from the hand. The destructive element yielded to one of pity. I walked up, put my hand on its head, patted its neck, and without an expression of fear, it put its nose into the hand that had been raised against its life! Pitying its suffering condition, and as an act of charity, I passed a ball through its head, and she yielded up the life she had struggled so guardedly to protect. I drew her back, deposited her with her dead mates, and casting a satisfied look over my shoulder as I passed beyond the sight of my treasures, found my way back to town, after an absence of three hours and thirty minutes, a wiser and abler man. I offered to give odds over all competitors as against Old Probabilities. Be kind enough to thank him for me, and assure him that his counsel on the deer question is of paramount consideration always. BEDFORD.

DUCK SHOOTING IN NEW BRUNSWICK.

BY J. NEWTON WILSON.

MY London friend had been for some days coaxing me to go shooting with him. He wanted to see if our style of bagging game was like that of the old country. I told him I was a poor companion for a person of his gunning qualities to go with, but he insisted, and we went. A delightful day in early September found us drawing near the landing, close by which was located the pretty little village of Jemseg. We were soon on shore with our traps and dogs, yearning to catch sight of a duck or a blackbird, or anything that had feathers and two legs and which no body owned. We were both fully armed and equipped, provided with an ample store of eatables, etc. The house we intended to make our headquarters was situated about three miles from the landing. It was one of those bright and clear days peculiar to the early fall, and my friend Snobby acknowledged that our scenery was nearly as fine as in some parts of England. The shining waters of the Grand Lake lay before us, its mirror-like surface reflecting the shadows of spruce trees and the snowy sails of wood-boats. Farmers mowed their grass, whetted their scythes, laughed at us sportsmen, and chewed their soggy tobacco. Snobby and I jogged smartly along, carrying as many of our goods with us as convenient. After some warm walking we were directed to the house we wanted. A tap at the front door brought forth a maiden of say fifty summers, winters thrown in, of course. Her face indicated that she was one whom Nature had endowed with pleasant smiles, so essential to females of her tender years. I at once bowed low, and produced my letter of credit. She read it, and handed it back in a regular business-like way, saying, "We've got the scarlet fever here," and shut the door. Snobby was very indignant, and swore. We were tired, and felt like dining; besides, our traps were heavy. We sat for a while on the roadside and rested our limbs. Snobby London declared I was not posted in sporting, or else I would have had things differently arranged. A

all bounced by us, and sparkled like ginger ale. The pure gurgling stream looked inviting, I felt fatigued, and Snobby and I each took to himself a nip of whiskey and water. Then my English friend went in search of a native to obtain a conveyance of some kind. When he was gone I mused on the monotony of a country life, and after a whiff or so of a fair cigar gently passed into a sleep, with my head resting on some new mown hay. I had a vision, thought I saw away down into the cerulean ocean, dreamed I was up in a balloon, shooting down at ducks, and scanning the little world beneath me; thought I was killing trout by moonlight with three miller flies and a fire on the bank; imagined I was winging ring-necked snipe at Courtney Bay mud flats. In this blissful mood I awoke, and away before me over a western forest was setting old Sol, casting his scarlet reflections through the thousand clouds that rested in a world of glory above him. I sprang to my feet, grasped my revolver belt and cast it from my limbs, unwhipped my cap, and thrust my head into the icy brook and came out refreshed. I then beheld Snobby on an ox cart, coming at a snail's pace. Our stuff was put on board, and we were hauled to an inn, or rather to a red house built over some tan vats. Here we learned that the host's good wife was crazy with the toothache. She asked my companion if he was aware of anything that would give her relief. He told the sufferer to make a huge plate of buckwheat pancakes, and rub her cheek with plenty of Radway's Ready Relief, but not to put any on the pancakes. The poor woman made us comfortable, and I ran up to a store and purchased for her the article recommended, and it cured her almost immediately. Her husband thanked us with tears in his eyes, and declared he would get some sleep that night. We retired early, having made previous preparations for the next morning's shooting. Snobby snored loudly, after a while, and kept the lamp chimney on the dance continually. I elbowed him in the ribs, and brought him to a sense of quietude. Grey daylight broke, and the stars were still glittering in the heavens. We were soon up and dressed and away. Our dogs were particularly delighted, and showed their villainous training by running after every bird or grasshopper that happened along. They also barked handsomely, so that if any ducks were about they would have known that we wanted them. Snobby considered his dog very valuable, had refused one hundred dollars for her, and he always allowed her to sleep on the foot of his bed. One night I awoke and felt a great pressure on my legs, and I found that it was this valuable pup. Notwithstanding this, I gave the beautiful canine creature a rise that caused her to tumble awkwardly into a harrel of wool that formed part of the furniture of our room.

We found a canoe, and away we flew past marshes and dykelands. The morning was charming, and the luxuriant grass bowed submissively before a refreshing breeze. We landed a mile or so from the starting point, and crept cautiously up to a long sheet of water, on the surface of which we discovered a large flock of black ducks, with their heads nicely tucked under their wings. Our dogs acted quietly enough, for I had made mine fast to my boot, and Snobby's was under the influence of so sound a kicking that she was calm and motionless. We both rose at a signal and fired. At this Snobby's dog rushed pell mell into the water, kiying grandly. My pure breed followed with a fierce spring, pulling off my boot, and away went ducks, dogs, boot, and all. I was filled with rage, and if I had been within a fair range of my brother sportsman's dog I would have been much tempted to shoot it; but the reader will say the dog would not have risked much, seeing that I killed no ducks. Neither of us stopped a bird. How admirably our dogs hunted the marshes that morning. They must have beat over miles away. They hunted all the ducks off. I put some shot in my dog, which hit him near the tail, but he was not the style of dog to stop at trifles. Snobby anathematized everything. A farmer in the next township found my boot the next day. By very hard work one morning we bagged some fine snipe and a marsh hen or two. From this out the hundred dollar dog acted well enough, because its owner had to keep it tied up at the inn. Mine would beat the hunting grounds thoughtfully, and would good naturedly scratch shot out of his back and wag his tail knowingly.

One afternoon we concluded to make a grand circuit, and do the whole marsh. We went. Our intention was to take the ducks as they flew over us, bound for their feeding grounds. Evening finally arrived, and threw her sombre shadows over hay cocks, barns, and us. Many flocks whizzed over our heads, and numerous were the times we pulled trigger on them. We got one. Snobby declared he killed it, and I thought I did. It lay before us a case for equity. I resigned it to Snobby London—he had earned it. After this slim sport among the dykelands, we concluded to take the steamer and go down the river and have a day or two at the Nerepis with our friend B—. We landed from the Rothesay quite near his cozy home, which nestled in a green valley, enclosed by an amphitheatre of hills, from the summits of which a cheering view of our noble river was afforded. It was among these hills the blue-jay flew. The familiar voice of the crow sounded from many a tree, and the partridge's loud whirr caused the anxious gunner to grasp firm his piece. It was the partridge we wanted. We were up before the sun next morning. We must make the best of it, for we were on our last day; and so we climbed the rugged hills with a will, feeling confident that we would bring honorably to bag fully a dozen brace of partridges before noon. We had become disgusted with duck-shooting. We preferred

partridges. Many a weary mile we travelled. Our friend and guide, B—, had often told us, in town, of his genuine partridge dog; so, of course, we must have a fine day's sport with such an animal. We now most firmly selected the partridge in preference to any other bird. "If the partridge had the woodcock's thigh it would be the finest bird that ever did fly," says the poet. We concluded it was the finest anyhow. We imagined this fowl roasted on a spit and served up with sauce, *a la Russe*. Alas! our hopes were in vain. B—'s dog had been caught in a bear trap, and consequently had a lame paw. He would strike the scent of a rabbit or porcupine, and off he would dart, with tail erect and nose low, and finally give tongue encouragingly. Forward we would press with our guns at half cock and we breathless. "He's got a covey," B— would say, and when we found him, instead of barking at game he would be sitting on his haunches, growling at his dilapidated paw and gnawing it.

A partridge was treed at last—one of the Audubon type, said Snobby, who scrambled towards it and fired at about ten yards distant. The bird looked at him for a few seconds, and just as he was about to give it the other barrel, after taking aim for that length of time, with a loud whirr off went the beautiful gallinaceous biped through birch trees and mossy glens. Close in pursuit sprang my dog, gallantly serenading the woods for a league or more. Noon was now upon us, and "the merry, merry sunshine" made joyous the day, which had so far been dull and misty. We turned homeward, for a keen hankering for "prog" came over us.

At our friend B—'s a savory dinner awaited us. An immense dish of lamb chops formed a centre on the ample table, the corners of which were graced with green peas, new potatoes, tomatoes, and numerous other dainties that tend to make life pleasant. Before partaking of this sumptuous board, Snobby invited us to come outside to "take something." Fatal moment! While praising the mellowness of the whiskey I perceived my dog making his way out of the back door. He was licking his ponderous jaws, and appeared languid. After him flew the cook with a mop handle, which she laid on his broad back with a giant stroke. "Oh, heavens," she screamed, "your horrible cur has devoured all the dinner!" It was too true; he had gathered it all to himself, leaving only the dishes, knives, forks, and other indigestible articles. I felt anything but pleasant, and broke forth to the hostess as follows:—"Madam, this act of my dog I most sincerely condemn, and I most solemnly assure you he has received well-merited punishment, for his back is rendered so much out of shape that his only use hereafter will be to run around corners." The fact is, the animal was rendered useless, and his body was sadly bent; but at all events his stomach was all right for that day. Our dinner passed off without the aid of meat. I however thanked my stars it was no worse, and did ample justice to hot potatoes and new butter.

But little more is to be told. That afternoon we landed at Indiantown, and the loud strains of the fog horn on Partridge Island reminded us that we were home again. We hired a whole coach to avoid questioning. On the road home my dog got lost, and I was glad of it. Snobby gave his away and sold his gun, and forever retired from the field. Your humble servant, however, purchased a water spaniel pup and a breech-loading gun, and as some years have passed since this narrative he is now a fair shot, and often makes a bag that many a good sportsman would be proud of.

X HARES AND RABBITS.

EDITOR FOREST AND STREAM:—

Why can not sporting men in writing for a sporting paper call things by their right names? Call grouse *grouse*, not partridge or pheasant. We have no pheasant in this country, and I think no partridge proper either, the quail coming the nearest to it, though it differs in size and in other respects from its European cousin. Neither have we a rabbit of any kind running wild in all our woods.

To be sure I can see the advantage of sometimes using the above terms in conversation with a country boy when in a strange part of the country in pursuit of a bag. Should you on meeting him ask if there were any ruffed grouse to be found in those parts, it would be a box of caps to a billiard ball that he would not know what you meant. But if he should say "I never heard of sech, but I knows where up in the old man's back brier lot there be lots and slathers of patridges," you might get the information you wanted, and it in the end prove very gratifying. But again in enquiring for woodcock should your rustic assume to be thoroughly posted, "knows where there be a heap of them ere," and you go with him with visions of a big bag of these choicest of birds in your mind's eye, and he takes you to "dad's sugar bush," and points you out a red-headed "wood-pecker tapping on the hollow beech tree," your information would not be as satisfactory and you would want to say—a bad word—and retire in disgust. Had you asked him about "blind-snipe," he might have taken you down to the lower "pastur" among those willows on that brook, or to that damp place on the road in the woods the way he "druv the keows hum o' nights," and you might have found a brood, perhaps more, plump and well grown, and never having been shot at, easy to bag.

All this may be pardonable and even necessary on the principle I suppose of "when you are among the Romans, do as the Romans do," or talk their language at least if you want to find out anything, but in writing for our papers—that is in our social talks—intelligent sportsmen one

with another (for a sporting paper is that or should be and nothing else) let us call things by their right names.

I was glad to see that S. L. P. in one of your recent numbers in his very graphic article on "Hare Hunting," uses the right word for the right animal, but many sportsmen use these wrong terms in their sketches, when they know better. If I can aid you any in settling this matter or convey any acceptable information I shall be abundantly satisfied. I shall at least feel better after relieving my mind on the subject.

"I arise to explain" that we have no rabbits in this country. The little grey fellows so plentiful around our hedges and thickets, more especially in the south and west, are hares.

It is most preposterous nonsense to talk of coursing or running a rabbit with dogs for any sport in the thing. You might with equal propriety speak of coursing a cat. While the latter with a spit and a phizz, with an arched back and an enormously enlarged narrative would be in a jiffy on the top of the barn or in a tree, the former would disappear in the first hole he could pop into.

The rabbit, *Lepus cuniculus*, is a congregationalist, (I speak not orthodoxically, and yet I think I do too, which to say the least appears rather paradoxical) is very friendly and sociable in its habits, living in villages or warrens. It is polygamously inclined at least in its domesticated state, though I believe not when wild (proving so much for civilization). It breeds six or seven times during the year, taking great care in arranging its nest in the darkest and safest part of its burrow, lining it with the softest of fur plucked from its own body. It brings forth from five to eight at a litter, sometimes more. The little fellows are ushered into the world without hair and are stone blind, their eyes not opening until the tenth or twelfth day. They are very tender and weakly, requiring especial care from the mother for several weeks.

The flesh when cooked is whitish in color, somewhat juicy, with not much if any game flavor.

It is not a nocturnal animal, for the most part lying snugly coiled up in the recesses of its burrow during the dark hours.

The hare *Lepus sylvaticus*, is monogamous and a timid hermit-like creature, sits by himself nearly all the day in his form, a mere indenture in the leaves often in the open ground or under a bush, and when aroused by the dogs is off like a shot, trusting to the speed of his foot and his cunning art in doubling to save his skin. His ears are very acute, always open, and so constructed as to catch the slightest sound in any direction. His eyes too are never closed even when he is asleep, and are so prominently situated as to enable him to take in almost an entire circle at a glance. The hare takes but little pains with its home domicile, being satisfied with a mere depression in the ground or under a bush of grass. Sometimes, though, it takes possession of a hole in a wall or decayed tree where it brings forth from three to five youngsters two or three times only during the year. The young leverets come forth with their eyes open, and with their clothes on, and ready almost at their birth for regular hare business.

The flesh is dark and dry, with a decided game flavor, but after the first frosts have toned down its somewhat stringy nature is very good, and were it more difficult to obtain would be highly prized.

The hare is emphatically a night animal, feeding mostly then, and on a moonlight night it is an interesting sight when you are well concealed to watch their fantastic gambols. They are very destructive to young nurseries, girdling the small trees, doing much damage in a single night.

The undersigned with one other once in two hours of a moonlight night in Wisconsin shot nineteen in the road as they crossed from an oak thicket to a young nursery. It was fun for us but "frogs for them."

We have several different varieties of the species *lepus*, but the two best known is the one above mentioned and the northern or great hare, *L. Americanus*. This one has an advantage over his smaller brother in possessing two suits of clothes, or at least a change, a brown turning to grey for summer, with almost a perfect white for winter use, whereby he is better enabled to escape the lynx-like eyes of his hunters. I can not better close this article than by an extract from Chambers' Encyclopedia. It says the species of *lepus* are abundant in Africa and western Asia, but North America possesses more species than either.

Baird divides the American species into five sections dependent on the degree of separation of the post orbital processes from the side of the temporal region. In one extreme they diverge widely from the cranium, in the other they are in close contact with the distinguishing suture obliterated.

To the last belong *L. aquaticus* and *L. palustris*, large headed species from the swamps of low countries of the southern States. To the first, the Arctic hare (*L. glacialis*) the changing hare (*L. Americanus*) and the Oregon hare (*L. Washingtoni*) of the higher northern regions.

Several species (*L. campestris*) *L. callotis* (*L. artemesia*) inhabit the places west of the Mississippi river. The *L. callotis* is well known to pioneers in Texas and New Mexico as the jackass rabbit. JACOBSTAFF.

—The following is said to be an extract from the diary of one of the first ministers in the Green Mountain State: "Went this evening to see Miss Susy Smith. On my way saw a peculiar animal. When it went into its hole it disappeared; when it came out of his hole, it appeared. Spoke to Miss Susy about it, and she said it was a skunk, and suppose it was a skunk."

WHERE TO HIT A GRIZZLY.

EDITOR FOREST AND STREAM:—

Several hunters are annually killed by grizzly bears in the United States. The precise location of the most vulnerable spot of *Ursus Horribilis*, is therefore a matter of great importance. The small powder charges used in American sporting rifles render a front shot extremely critical. One of these tough customers has been known to swim half a mile with two bullets in his heart.

If a side shot can be obtained, most hunters aim at the spinal cord, just behind the ear.

Mr. J. H. Batty, Taxidermist to the Hayden Exploring Expedition, informs me that the skull of the grizzly, referred to in the *FOREST AND STREAM* of Dec. 11, page 282, was not fractured, but that the first "cervical vertebra" was shattered by the first shot.

Lieutenant Carpenter sends the following interesting account of the affair, showing that even an explosive bullet must be judiciously placed to be effective:—

S. H. MEAD, JR.

"WASHINGTON, Dec. 23, 1873.

MR. MEAD, *Dear Sir*.—I cheerfully answer the enquiries contained in your letter of the 22d instant. I claim that I killed the bear with the first shot fired, an explosive one. This shot completely paralyzed the animal, and it was not really necessary to fire another one. I fired four shots, the two first explosive, the two last, solid. The first shot was fired at forty yards, the second shot at eight yards, the third shot at thirty yards, the fourth shot at about fifteen yards. The first shot, explosive, struck the animal behind the ear, badly shattering, but not disconnecting the first "cervical vertebra;" at the crack of the rifle, the bear instantly dropped and remained perfectly quiet for two minutes. He then raised himself in a sitting posture, but could not stand up, the blood was streaming down his head and neck, and the ground where he fell was covered with it. While in this position I fired the second shot at the head. This shot, explosive, struck the bony arch over the eye and flattened out just under the skin, without doing the slightest damage. It tore the skin and flesh some, and knocked him clear over, but I regard it as of no effect. (If this had been my first shot, I would have been in a bad fix.) The skull was not penetrated or fractured. The animal was on a very steep mountain side, and when the second shot knocked him down, he rolled over and over for sixty yards, until he brought up against a large log. I then went close to him and saw that he was perfectly helpless, but as he was still breathing, and by no means presented a tame appearance, I finished him with two solid balls in the neck. I think that the resistance offered by two inches of solid bone, backed by about five inches of hard muscle and followed by the skull, which is $2\frac{1}{2}$ inches thick on the side, proved too great for the penetrative power of the explosive bullet, and while I regard their effect when fired into the body, shoulder, "vertebrae," and in fact any part of an animal, except its head, as terribly destructive, yet, I beg to be excused from trying them again on grizzlies, unless I can get another chance at the neck. * * * * * I am going to try your bullets on deer, elk and antelope. I think the charge of powder for the calibre 50 bullet rather light.

Yours truly,

LIEUTENANT W. L. CARPENTER,
U. S. Geological Survey."*National Pastimes.*

ST. GEORGE'S CRICKET CLUB.—The annual meeting of the St. George's Cricket Club was held on the 5th instant, when the following officers and committee were elected for the ensuing season:—President, John G. Dale; Vice President, George T. Green; Treasurer, Charles Vinten; Secretary, W. R. Bowman. Committee—Messrs. Mostyn, Mumford, Talbot, Moeran, and Satterthwaite. Reports from the Secretary and Treasurer were read, showing the club to be in a highly prosperous condition, with a large increase in the number of its members, and a considerable balance in the hands of the Treasurer.

THE RULES OF CRICKET.

No unprejudiced person can read the existing rules governing the game of cricket without being impressed with the fact that they are not only incomplete in not covering all the important points of the game, but also that they are generally so crudely worded as to admit of several interpretations; and, moreover, they are not arranged either in proper order or under appropriate heads. In our series of articles on the rules of the game, while giving explanations of each rule, we shall point out such errors as exist, and give the definition of each rule as it is understood by the Secretary of the Marylebone Club of London, with whom, while he was in this country, we conversed on the topic of the rules and their authorized interpretation.

THE BALL.

1. The ball must weigh not less than five ounces and a half, nor more than five ounces and three-quarters. It must measure not less than nine inches, nor more than nine inches and one-quarter in circumference. At the beginning of each innings, either party may call for a new ball.

It is not customary now to use more than two balls in a match, in fact one suffices in one-day matches except the ground be wet and the ball becomes soggy. The rule, however, if strictly enforced would require the use of four balls to a full match of four innings. In buying balls for club use it is always the cheapest to get the best, as the low priced balls give way in the seams very quickly. The best balls made are those which have their seams sewn with cat-gut.

THE BAT.

2. The bat must not exceed four inches and one quarter in the widest part; it must not be more than thirty-eight inches in length.

This rule is too indefinite in its wording to have full effect, inasmuch as it does not state what the material shall be of which the bat is to be made, and neither does it define the length of the bat itself, but simply states that the bat—including the bat proper as well as the handle—shall not exceed three feet in length. A short man does not require so long a handle to his bat as a tall man, but both require the same amount of width to guard their wickets. The rule, therefore, should designate the exact length of the "pod" or bat proper, leaving the handle to be short or long, but not exceeding a certain length. The rule does not state how thick a bat may be or what limit of weight there should be. All this is left to custom to govern, when the rule should expressly define it. All good bats are now made of straight-grained and well-seasoned willow, with the handles strengthened by strips of cane. Of course it is the umpires' duty to see that the laws governing the materials of the game, such as size and weight of ball, size of bat, length of stumps, &c., are all enforced; but there is nothing in the above rules calculated to have them properly enforced.

THE STUMPS.

3. The stumps must be three in number; twenty seven inches out of the ground; the bails eight inches in length; the stumps of equal, and of sufficient thickness to prevent the ball from passing through.

This rule is very badly worded. What is meant, is, that the stumps shall not exceed 27 inches in height when fixed in the ground, and that the width of the "wicket"—the three stumps and the bails—shall not exceed eight inches in any part of it, while the stumps are to be of such a thickness as not to allow the ball to pass between them without touching the stumps. By the rule, as it now reads, the stumps may be made of iron, and the bails can be eight inches in length, instead of four, as each bail should be. The best material for stumps is hickory, which is tougher than oak or ash. They should also be brass, tipped with iron at their points. The rule ought to state that the stumps shall be of equal thickness and not exceeding an inch or an inch and a half in thickness.

THE BOWLER'S POSITION.

4. The bowling crease must be in a line with the stumps; six feet eight inches in length; the stumps in the center; with a return crease at each end towards the bowler at right angles.

The term "bowling crease" is very indefinite. The proper way is to word the rule so as to define the bowler's position as being limited by lines of three feet, extending from the outer stump on each side of the wicket. The word "crease" is a technical term and scarcely suited for the phrasing of a law. There should be a three-foot line located where the "return crease" is now laid, and also a limit to the ground the bowler occupies in the preliminary run he makes in delivering the ball.

THE BATSMAN'S POSITION.

5. The popping crease must be four feet from the wicket, and parallel to it; unlimited in length, but not shorter than the bowling crease.

The batsman's position is behind a line unlimited in length, but located four feet distant from the bowler's line or line of the stumps. Both lines require to be plainly marked with chalk or some white substance so as to be seen by the umpires, the line of the batsman's position—called the "popping crease"—not being less than six feet in length. Every cricket club should have a frame made six feet eight inches in length by four feet in width, and by laying this down in front of the wicket with stumps in the center of one side of it, the two lines or creases could be correctly laid down.

PITCHING THE WICKETS.

6. The wickets must be pitched opposite to each other by the umpires at the distance of twenty-two yards.

Lillywhite's Guide for 1873, in its code of rules, has the word "caps" in place of wickets. What the rule means by the words "wickets must be pitched," is that the distance from the centre stump of one wicket to that of the opposite wicket must be exactly 22 yards. The umpires are by the above rule alone empowered to place the stumps in position, or in other words, "pitch the wickets."

THE CONDITION OF THE GAME.

7. It shall not be lawful for either party during a match, without the consent of the other, to alter the ground by rolling, watering, covering, mowing, or beating, except at the commencement of each innings, when the ground may be swept and rolled at the request of either party; such request to be made to one of the umpires within one minute after the conclusion of the former innings. This rule is not meant to prevent the striker from beating the ground with his bat near to the spot where he stands during the innings, nor to prevent the bowler from filling up holes with saw-dust, etc., when the ground is wet.

In commencing each innings, if the side at the bat desire it, the ground between the wickets can be rolled and swept; but the other side can only do so until the batting side object to it. Of course, by mutual consent, this can be done at any time during the game. Before the delivery of the ball the batsmen can step out of their ground for the purpose of beating down any inequalities of the ground with their bats, as also after the ball has been held by the wicket keeper and thereby rendered temporarily dead, as also, after an over has been called. The rule in this latter respect is, however, too indefinite in its wording for so important a point.

CHANGING THE WICKETS.

8. After rain the wickets may be changed with the consent of both parties.

There is no rule providing that the wickets shall not be changed. The above are the rules referring to the ball, bat, and the wickets. Next come those governing the delivery of the ball to the bat, to which we shall refer in full in our next article on the subject.

AMERICA vs. ENGLAND.—Arrangements have been made by the Boston and Philadelphia Base Ball Clubs to send a joint team to England next August, the same to consist not only of two tens to play base ball together in championship matches in England, but also a twenty-two to play at cricket against the strongest professional and amateur cricket elevens of England. Mr. H. Spalding, of the Boston Club, leaves New York, next Saturday, for England, to make the preliminary arrangements. The American twenty-two will practice cricket together on exhibition games before they leave, playing the St. George Club, in this city, in July.

UNIVERSITY, VA., Jan. 12, 1874.

EDITOR FOREST AND STREAM:—

Since my last letter to you, we have had such bad weather, that we could not play foot ball, and of course did not expect the Englishmen to come here, when the ground was soaked by a week's rain; they disappointed us, for they came, and although it was pouring down rain, they insisted on playing, saying they would claim the game if we did not play, as rain never stopped a game in England. Each side won a goal, and when time was called we were playing the third game with the ball within a few feet of the Englishmen's goal; it was decided a drawn game. We have, so far, had only one freeze in Virginia this winter; very few persons have filled their ice-houses.

J. C. McK.

—Mr. H. W. Collender has published a pamphlet containing a full account of the first International Billiard Tournament held at Irving Hall in June last. It is illustrated with diagrams of the most difficult shots made by the celebrities who participated in this great contest, and is a very useful and interesting publication. Sent, postage free on receipt of twenty-five cents.

CREEDMOOR.—We regret to state that the last heavy rains have done no small amount of harm to the range at Creedmoor. Five hundred and forty feet nearly of the embankment on the south side, the side fronting the shooter is down, carried away by a regular land slide. The earth was evidently saturated by the rains, and tumbling down has filled up the drain and the road, which had been carefully laid between the targets and the embankment. The fall of earth has covered the target platform; and the roofs of the butts, and in several places the debris extends past the terrace and into the plain to a distance of sixty feet from the edge of the embankment. The force of the dirt-fall was such as to have moved three of the iron slabs, weighing fully 1,250 pounds and to have torn up the extra heavy weight iron sheeting used to cover the butts. The doors of the butts have been in some cases broken in, but fortunately the butts have held firm. It will cost fully \$2,000 to repair damages. We are pleased to state that the Range Committee, Generals Shaler and Woodward and Captain Wingate, have already made arrangements to repair the damage. The misfortune about the tumbling down of the embankment is, that with the open winter, the managers of the N. R. A. were in hopes that rifle practice might have been commenced quite early for 1874; as it is, with the well known energy of the Range Committee, we feel sure the delay in the opening of the range at Creedmoor, should it occur, will be but short.

THE WOODS OF THE SIERRA.—Nothing can be more charming than the woods of the Sierra summit in June, July, and August, especially in the level glades margining the open summit valleys, at an elevation of 6,000 to 7,000 feet. The pines and firs, prevailing over spruces and cedars, attain a height ranging from 100 to 200 feet, and even more. Their trunks are perfectly straight, limbless for fifty to a hundred feet, painted above the snow-mark with yellow mosses, and ranged in open, park-like groups, affording far vistas. The soil may be thin, but it is soft and springy to the tread, covered with needles of the pine, greened with tender grasses and vines, and thickly sprinkled with blossoms. Huge boulders of granite relieve the vernal coloring with their picturesque masses of gray, starred with lichens. These rocks are often nearly hid in vines, or in dwarf oaks and manzanitas, which, under the pressure of deep snow, assume a vine-like growth, winding all about a boulder with their clinging and sinuous small branches. Thickets of wild-rose and other flowering shrubs occur at intervals, giving an almost artistic variety to the woodland scene. The crimson snow-plant lifts its slender shaft of curious beauty. Large patches of helianthus, some species with very broad leaves, spread their sun-flowers to the air. Sparkling springs, fresh from snowy fountains silver-streak these forest meadows, where birds come to bathe and drink, and tracks of the returning deer are printed. Once more the quail is heard piping to its mates, the heavy whirring flight of the grouse startles the meditative rambler, and the pines give forth again their surf-like roar to the passing breeze, waving their plumed tops in slow and graceful curves across a sky wonderfully clear and blue.—*Overland Monthly*.

—What seems to be a perfectly authenticated case of horrible death from the bite of a cat, hydrophobia having been developed, has occurred in Brooklyn, L. I. Mr. Jas. P. Raymond, a young man of twenty-two years of age, was bitten by a cat some six months ago, and expired on the 29th of December last, with every symptom of this terrible disease. The testimony of the physicians leaves no doubt as to the origin and character of the fearful malady.

For Forest and Stream
INGLE-NOOK.

NOW all the woodland paths are strewn
With autumn's tawny leaves;
The Frost elf hangs his glittering gems
Upon the cottage eaves.
The dancing brook has lost its glee,
And clinks in fetters down,
Each mountain monarch of the north
Puts on its crystal crown.

But circling round our gladsome hearth,
With merry chat and song,
Still may we tread the forest glade,
And errant days prolong.
Once more the dainty line we cast,
Or track the startled deer,
As summer scenes go flitting past,
And wildwood sounds we hear.

What reck we of the pinching cold,
The fetters round us flung?
Let hermits in their caves grow old,
Good cheer shall keep us young.
As memory doth her treasures bring
Hope pictures coming days,
When lured by balmy breath of spring
We seek the woodland ways.

Thus will we count our trophies o'er,
And plan the new campaign,
Till from the snow-drifts at the door,
The crocus peeps again.
Then pile the faggots high, my boys,
And mid the ruddy light,
We'll link our past and future joys
In golden bonds to night.

T. W. A.

TO PROFESSOR AGASSIZ.

BY SAMUEL D. ROBBINS.

Great prophet of eternal nature, thou
To whose pure heart her inmost secrets bow,
'Tis thine to read, with innocence sublime
In archives deep the autograph of time.
The rock of ages to thy vision clear,
Reveals the annals of the growing sphere,
Scriptures in cipher, by the icebergs old,
On mount and plain and boulders manifold.
Glad to the reverent research, Ocean gave
Its choicest treasures from its lowest cave:
On shell and fossil thou hast learned to find
The earliest signets of creative mind.
A grateful world lifts up one prayer for thee!
Long as time lasts, dear shall thy memory be.
Who lowly bows before the humblest clod,
Becomes himself a Temple filled with God.

Natural History.

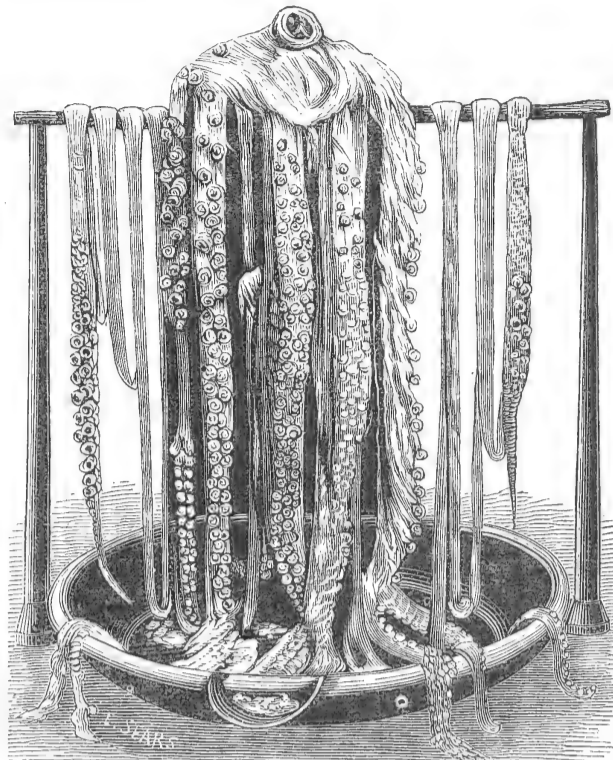

THE GREAT OCTOPUS.

ST. JOHN'S, NEWFOUNDLAND, December 24, 1873.

EDITOR FOREST AND STREAM:—

Two fishermen were out in a punt on October 26th, 1873, off Portugal Cove, Conception Bay. Observing some object floating on the water at some distance, they rowed towards it, supposing it to be a large sail, or the debris of a wreck. On reaching it one of the men struck it with his "gaff," when immediately it showed signs of life, and reared a parrot-like beak, which they declare was "as large as a six gallon keg," with which it struck the bottom of the boat violently. It then shot out from about its head two huge, livid arms, and began to twine them around the boat. One of the men seized a small axe and severed both arms as they lay over the gunwale of the boat, whereupon the fish moved off, and ejected an immense quantity of inky fluid, which darkened the water for two or three hundred yards. The men saw it for some short time afterwards, and observed its tail in the air, which they declare was ten feet across. They estimate the body of the fish to be sixty feet in length, five feet in diameter, of the same shape and color as the common squid, and they observed that it moved in the same way as the squid, backwards and forwards. They had ample opportunity of observing its shape and dimensions before they were alarmed by its movements, so that their statements are quite reliable, especially when corroborated by the arms, which they brought ashore. One of these arms was, unfortunately, destroyed, but the clergyman of the village assured me that it was ten inches in diameter and six feet in length. The other arm was brought to St. John's, but not before six feet of it were destroyed. Fortunately, I heard of its arrival, and had it preserved. Mr. Murray, our Geological Surveyor, and I examined it carefully, had it photographed and immersed in alcohol, and it is now in our museum. It measured nineteen feet, is of a pale pink color, and entirely cartilaginous, tough and pliant as leather, and very strong. It is but three inches and a half in circumference, except towards the extremity, where it broadens like an oar to six inches in circumference, and then tapers to a pretty fine point. The under surface of the extremity is covered with suckers to the very point. First there is a cluster of small suckers, with fine sharp teeth round their edges, and with a membrane stretched across each. Of these there are about seventy. Then come two rows of very large suckers, the movable disk of each an inch and a quarter in diameter, the cartilaginous ring not being denticulated. These are twenty-four in number. After these there is another group of suckers with denticulated edges, similar to the first, about fifty in number. Along the under surface about fifty more small suckers are distinguished at intervals, making in all about 180 suckers. The men estimate that they left at least ten feet of the arm attached to the body of the fish, so that its original length must have been thirty-five feet.

I am assured by a clergyman here that during the winter of 1870 two cuttles were cast ashore at Lamaline, the bodies of which measured respectively forty and forty-seven feet. More than once we have had accounts of gigantic cuttles being seen in some of our bays, but not till now was any portion of them secured.

THE OCTOPUS.

Since the foregoing occurrence took place a perfect specimen has been captured by some fishermen in Logie Bay, a few miles north of St. John's, and I have been fortunate enough to obtain possession of it. After carefully measuring it, I had it photographed and then immersed in the strongest brine. Its dimensions are small compared with those of the giant seen in Conception Bay, but still it possesses great interest for naturalists. The body of this cuttle is eight feet in length and five feet in circumference. The tail is two feet in breadth at the widest part, and has a fin like expansion. The fish, on examination, proved to be a decapod, having ten arms, radiating from the central part, or head, in the centre of which is a strong, horny beak, shaped like that of a parrot, and about the size of a man's fist. The eyes are behind the central nucleus, and are each four inches in diameter, very prominent and dark, with a white circle around. Two of the arms are much longer than the others, being each twenty-four feet in length, not more than two inches and a half in circumference, and arranged at the extremities with sucking disks, arranged in the same way as in the amputated arm I have already described. All of these suckers have sharp denticulated edges, and twenty-four of them are large, and arranged in two rows, each being an inch in diameter. The others vary and decrease in size towards the extremity, where they are not larger than a split pea. In all there are about 150 suckers on each of the long arms. The eight shorter arms are each ten inches in circumference at the point of junction with the head, and taper to a fine point. Their under surface is completely covered with large suckers, arranged in a double row, and each arm carries about one hundred. The total number of suckers is thus about 1,100. The eight shorter arms are each six feet in length. Connected with the body is a funnel, through which the water is ejected after the extraction of its oxygen by the breathing organs. This funnel runs the entire length of the body. It serves another purpose—when the water is forcibly ejected by the reaction of the surrounding medium the fish moves backwards with great swiftness, while the forward motion is accomplished by the movements of its tail. There is a second funnel, through which the inky fluid which it secretes is ejected when the creature wishes to escape from its pursuers.

It is believed here, by those familiar with these cuttlefish, that my specimen is a young one—perhaps two or three years old—and which, if not captured, would probably have grown to the length of forty or fifty feet in the body, as their growth is wonderfully rapid. At all events, the existence of cuttlefish in the waters around this island is beyond all question. I am informed by an intelligent person here, whose veracity I could not question, that he measured the body of a cuttle fish cast ashore in a storm in Green Bay, about two years ago, and found it *eighty feet*. The Rev. A. E. Gabriel, of Portugal Cove, assured me that in the winter of 1870, when he lived at Lamaline, on the southern coast, two cuttles were cast ashore whose bodies measured forty and forty-seven feet respectively. Many persons have informed me of having seen them from twelve to twenty feet in length of body, and arms between thirty and forty feet. Our fishermen universally believe in them, and call them "big squids." They have a saying that "the squid is the biggest fish in the sea." A fisherman here—a simple-minded, honest fellow—told me that his small coaster was once anchored in one of the northern harbors, when suddenly, though making no water, she began to sink. Those on board took to their boats in alarm, but after going down till the water was nearly on a level with the deck she suddenly rose again, and took no harm. Soon after

they observed a "big squid" disporting in the water, and concluded that it had grappled their craft with its arms and dragged it down as far as it was able, and then suddenly relaxed its hold from some cause.

Our fishermen say that these cuttles anchor themselves to a rock or to the bottom by their long arms, and thus obtain a "purchase" when grasping anything with the shorter arms. A few years ago a gigantic cuttle was taken on the Labrador side of Belle Isle Straits, whose body measured fifteen feet, and the longest arms thirty-seven feet each. This is thoroughly authenticated by Dr. Honeyman, of Halifax.

Among the last things Professor Agassiz did was to write to Mr. Murray, of our Geological Survey, in regard to the great cuttle whose arm was amputated in Conception Bay. He wished to see the arm in order to determine to what species its owner belonged. I was just about to send him my specimen when news arrived by telegraph of his death.

I may mention that the eminent naturalist, Professor Steenstrup, records the appearance of similar gigantic cuttles on the coast of Denmark, and describes two species under the name of *Architeuthis* and *A. dux*.

The photographs which I enclose were taken by Messrs. McKenny & Parsons, of this place. One is a photograph of the head resting on a stand, the arms hanging down, their extremities in a large round bath, the beak in the centre. The two longer arms are coiled on each side of the shorter ones, at the extremity of the supporting rail, and all the arms show the sucking disks. The body is photographed separately, as the head was cut off by the fishermen when killing it.

M. HARVEY.

[The photograph of the body we have not reproduced, as it presented no striking feature.]—Ed.

SNAKES SHEDDING THEIR SKINS.

EDITOR FOREST AND STREAM:—

I once had the chance to see a snake shed his skin. I think it was in the month of June. I was standing in the field when I observed a striped snake going through some strange contortions, turning first on his back and then on his side, and all this time his head was kept in between two small sprouts about half an inch apart. I thought at first he was insane, or performing for the circus, but in a few moments all was made plain; he was getting the old skin started from around his mouth. At last it gave way, and began to roll over his back, and he soon pulled himself out of it, and left the skin turned completely wrong side out. He then went on his way, acting as though he felt very happy.

Question: Do all snakes shed their skins? and if so, do they shed them more than once in a year? and will snakes freeze and then thaw out and live, as worms, ants, bugs, etc., do? I have found that striped snakes will drown under water in a short time. Now, how is the water adder constituted that he can remain under water? Will some of your correspondents please explain? I found on examination that the snakes shed a covering to their eyes, and I am inclined to the belief that they can see but little, if any, for some days prior to shedding their skins, and lie around inactive.

J. L. HERSEY.

EDITOR FOREST AND STREAM:—

Mr. Hersey's letter is quite interesting, and I hope it will induce others to send to FOREST AND STREAM their observations on the subject. His queries, too, are very suggestive, though they forcibly remind the reader that it is easier to ask questions than to answer them.

Do all snakes shed their skins, and if so do they shed them more than once in a year?

All snakes do shed their skins, the first moult occurring soon after the young snake is born. The moults are repeated at intervals of a month or two during the warm season, but in winter none occur. In captivity the shedding of the skin is not so frequent, and is very laborious and painful, sometimes resulting in death.

The shed skin is usually turned completely inside out, as in the case mentioned by Mr. Hersey. Whether this is always so is a question on which we need more light. Mr. James Simson, an enthusiastic correspondent of *Land and Water*, insists that they are frequently left "as the snake wore them." Frank Buckland is equally positive that this never occurs. I have in my possession the skin of a mountain black snake (*Coluber Alleghaniensis*) nearly seven feet long, which is inverted as neatly as a glove finger could be, and without a tear in it; also, an inverted skin of the common black snake, (*Bascanion constrictor*). I have a skin shed in November by a rattlesnake (*Candisona horrida*), afterwards a pet of mine, which remains in its natural position. I did not see the operation of moulting, and it is barely possible that the skin may have been turned while fresh and soft, but I do not believe that it was ever completely inverted. I should state that the snake was not in captivity when he shed this skin, but was taken just after the act of moulting.

"Will snakes freeze and then thaw out?"

Spallanzani kept snakes, frogs, and salamanders in a state of torpor in an ice house for three years and a half, and then easily restored them to activity. In our climate snakes retire at the approach of cold weather into their winter retreats in old burrows, hollow trees, or stone heaps, and there they remain, hibernating, until they are revived by the warm rays of the spring sun. It would seem as if they would often be exposed to a freezing temperature. I have found the common toad, in the early spring thaws, hibernating in the soil a foot or two below the surface, where it must have been surrounded throughout the

winter by solid walls of frozen earth. A pet black snake, confined in a well ventilated, unwarmed room, endured weather when the mercury stood at zero in the open air, but succumbed at twenty degrees below. I attribute his death by freezing to the fact that he was not in a state of complete hibernation, as he had frequently been handled during the early winter, and thus partially aroused from his stupor. A very interesting series of experiments could be made upon the hibernation of reptiles.

"How is the water adder constituted that he can remain under water?"

Cold blooded animals, such as serpents, consume little food, and, even when in activity, little oxygen, in this respect forming a marked contrast with highly vitalized, warm blooded animals. Birds, for instance, in their nervous, restless activity, require incredibly large supplies of food and a miniature blast furnace of oxygen to supply the incessant waste of their tissues. Serpents, on the contrary, pass the greater part of their lives in a state of sluggish repose, much like that of the higher animals in hibernation. Hibernating mammals can be kept under water for an hour at a time without harm, though three or four minutes would be sufficient to kill them if they were in their natural state of activity. The nearly complete suspension of all the functions of life reduces the demand for air, as for food, almost to zero. The water snake, coiled up under a stone at the bottom of a pond is not in a condition to demand large supplies of oxygen. Still he requires some, and a brief glance at his breathing apparatus will show us where he gets it. Like most other serpents, he has only one lung, the other being present merely as a rudiment. This lung extends a good deal more than half the length of his body, and the lower part is expanded into a membranous sac, or bag, capable of containing a considerable quantity of air. This bag stands Mr. Tropicodonataspipidon in good stead in more ways than one. When he dives he swallows his meal in a single mouthful, which is so ungenially large that it presses against his windpipe and stops his breathing, so that for the time being he must get his oxygen from his internal reservoir. Then when he makes a voyage under water he can carry with him a cargo of good fresh air.

I have not compared the lungs of the water and land snakes, but I imagine that very little difference would be detected. Professor Agassiz made a very interesting series of experiments with a view to determining the relative lung capacities of land and water turtles. He proceeded by pumping all the air from the living turtle, then pumping them full of water, then pumping out and measuring the water. He found that the capacity of the lungs of the land turtle averages twice as much in proportion to the weight of the body as that of the water inhabiting species, although the sea turtles carry a sufficient supply of air in their lungs to enable them to remain under water a half hour or more.

It will be found that water animals, as a rule, have their breathing organs much smaller than land animals. This apparent paradox is explained by the fact that a large amount of oxygen may be absorbed by the skin from the air diffused through the water. G. BROWN GOODE

Smithsonian Institution, January 3, 1874.

DO SNAKES HISS?

EDITOR FOREST AND STREAM:—

Let any one tease a bull snake, and he will be satisfied that they do. Last October I killed a snake on the prairie in Adair county, Iowa, five feet long, about an inch thick, tail extremely sharp, back dusky, and belly very brilliant lemon color. No one there had ever seen or heard of such a snake. I did not examine it to see if it was venomous. Can some one tell me its name? O. H. HAMPTON.

MONKEY BRIDGE BUILDERS.

EDITOR FOREST AND STREAM:—

To throw light upon doubtful questions or statements in regard to anything in natural history, even if not concerning game, is, I suppose, within the province of FOREST AND STREAM. In *Scribner's* for January, under the head of "Nature and Science," is the following:—

"In an article on this subject [bridge building] Mr. John W. Murphy says:—The first bridge builders that were of kin to humanity were of the monkey race. Travellers who have been through the wilds of Africa, South America, and portions of India, tell us how the monkey is a bridge builder. The traveller has frequently described how he has seen a convoy of monkeys making the attempt to cross the stream, and proceeding by a process which is described in this wise:—The leading monkey climbs a tree, as close to the shore as can be selected, holding by his forearms to the limb of the tree. He gives opportunity to each succeeding monkey to entwine himself with his prehensile tail, until, one after the other, they have become so attached, head and tail (the height of the tree being equal to the width of the stream), that the lower monkey, starting forward from the ground, by a pendulum movement swings himself to the opposite side of the stream. He then climbs the nearest tree, and when he has gained the height of the first monkey it will be easy to understand that there will be formed a catenary curve of monkeys from tree to tree across the stream. On this curve the youthful monkeys, the comparatively infantile monkeys, and the aged monkeys cross in perfect safety, and no monkey, either youthful, infantile, or aged, wets his feet in the water in crossing.

"Now let us see how our catenary bridge is removed when its work is done. The first monkey by a signal from the other side of the stream, lets go his hold of the limb and swings gracefully to the opposite side. Now, if Darwin be correct, and we are descendants of a race of mon-

keys, then it must be truthfully said that our ancestors have given us the best thoughts and principles of bridge construction."

Humboldt, in his "Travels," (Bohn's ed., vol. 2, p. 69) says:—"The uniformity with which the araguatos (*simia ursina*) perform their movements is extremely striking. Whenever the branches of neighboring trees do not touch each other the male who leads the party *suspends himself by the callous and prehensile part of his tail*; and, letting fall the rest of his body swings himself till, in one of his oscillations, he reaches the neighboring branch. The whole file perform the same movements on the same spot. It is almost superfluous to add how dubious is the assertion of Ulloa, and so many otherwise well-informed travellers, according to whom the marimondos (*simia belzebuth*), the araguatos, and other monkeys with a prehensile tail, form a sort of chain in order to reach the opposite side of a river. We had opportunities, during five years, of observing thousands of animals, and for this very reason we place no confidence in statements possibly invented by the Europeans themselves, though repeated by the Indians of the missions as if they had been transmitted to them by their fathers. Man, the most remote from civilization, enjoys the astonishment he excites in recanting the marvels of his country. He says he has seen what he imagines may have been seen by others. Every savage is a hunter, and the stories of hunters borrow from the imagination in proportion as the animals of which they boast the artifices are endowed with a high degree of intelligence. Hence, arises the fictions of which foxes, monkeys, crows, and the condor of the Andes, have been the subjects in both hemispheres."

Certainly if such an eminent scientific and critical observer as Humboldt fails to see such an exhibition during an observation of five years, seeing thousands of these animals, and characterized the story as dubious, the probabilities are against its being witnessed by the ordinary traveller. It is not the first time that a love for the marvellous has led to invention or exaggeration. Probably in this case the fact of the single monkey swinging from branch to branch has been the foundation for the fiction of the chain.

While such stories may sometimes serve very prettily to "point a moral or adorn a tale," it would seem to be in the interest of science, and a desire for exact knowledge in all departments of natural history, that anything doubtful or bordering on the marvellous should be given currency with caution, and especially should not be used as an introduction to an article on such a subject supposed to require accuracy of statement as "Bridge Building."

It would also seem to me, aside from the authority of Humboldt, that a little thought would demonstrate the improbability of the bridge story. In the first place the pendulum movement would require swinging room back of the bank of the river, which the dense and luxuriant vegetation of the tropics would allow but in few places. Again, when we realize that the pendulum must acquire sufficient motion to attain a horizontal position to reach across the stream, as wide as the tree is high, it is difficult to conceive where the motive power is to come from; surely not from the swinging or swaying of the lower monkey of the living chain, say twenty-five or thirty feet long. But given a tree as high as the stream is wide, and granting the swinging sufficient, the pendulum not being rigid, but a chain, would sag, and diminish its reaching powers, if I may so speak, so that when the end monkey of the chain had gained the height of the first, the chord of the "catenary curve" would not reach across the stream. And again, how could the end monkey land on the opposite bank, as the description quoted would seem to imply? for when in a direct line between the swinging point and the opposite bank he would be a considerable distance from it, and his landing and climbing the nearest tree would indicate a wonderful elastic power in the chain. The strength and ability of the first monkey to sustain the weight and tension of the swinging chain described, and other points of doubt, might also be suggested. What says FOREST AND STREAM? S. L. S.

—J. T. Wilson, of Brighton, Massachusetts, writes to us that he has a mounted specimen of a milk white woodcock, which was killed about fifteen years since by Elijah Bronson in Milton, Massachusetts, and bagged at the time with other cocks of the ordinary color and species. He adds that this is the "only one I ever saw, but I think I have heard of one in Troy, New York." [We will thank our readers to continue their reports on albinism, to furnish data for a comprehensive article on this interesting subject. The cumulative evidence of facts is invaluable.]—ED.

DEPARTMENT OF PUBLIC PARKS,
OFFICE OF MENAGERIE,
NEW YORK, January 10th, 1874.

Animals received at Central Park Menagerie for the week ending January 9th, 1874:—

Two giraffes, *Camelopardalis giraffa*. Hab. Africa. Placed on exhibition.

Two sea lions, *Eumetopias stelleri*. Hab. Northern Pacific Ocean. Placed on exhibition.

W. A. CONKLIN.

—One of your young legal gentlemen substituted a cuspidor for the old fashioned receptacle. Within an hour after the purchase, two freshly lighted twenty cent cigars rolled off the desk and disappeared in its yawning mouth. Shortly after, a letter from his affianced, enclosing a photograph, got joggled off and shot into the same chasm. Then he took the cuspidor into the yard, and attacked it with an axe.—*Danbury News*.

Woodland, Lawn and Garden.

THE BOX, AN INCREASE OF PLANTS.

NUMBER IV.

"Throw hither all your quaint enamell'd eyes
That on the green turf suck the hurried showers,
And purple all the ground with venal flowers;
Bring the rath primrose that forsaken dies,
The tufted crow-tree and pale jessamine,
The white pink and the pansy freckled with jet,
The glowing violet:
The musk-rose, and the well attired woodbines,
With houslick green that raise the pensive head,
And every flower that sad embroidery weaves."

IN our last paper—No. III.—we gave our readers some advanced ideas with regard to improving and elaborating the plants in the box of earth within the common window. This you will at once admit can be very much improved upon, and greater progress made in number of plants and soils, and many ornamental additions introduced as the simple results of suggestive embellishment. You first commenced, perhaps, with a single rose tree, a violet, or a hyacinth bulb. You learned in our practical paper that a knowledge of the soil necessary to the growth of these plants must, if not already known, be acquired. You are now somewhat acquainted with the chemistry of the making of soils, and preparing the same for your plants. You have from a few simple instructions produced a perfect blossom of the rose, the violet, and the hyacinth. You have learned that the soils thus prepared will grow many of the species cultivated, and you have not to learn this again; only to remember it. You now propose to make a garden within your window, which we will suppose to be a goodly-sized bay window, fronting on a southerly aspect. Plants of one species love full sunshine, of another quiet shade, and of another sunlight and shade, and some will rejoice in a tropical clime, warm and humid. These different climateries you will have more or less to imitate or produce, if you would rejoice your eyes with fairy grottoes or tropical dells in a miniature window garden. All these you can have in a greater or less degree of perfection, according as you are skilled or unskilled in the works of your hands. Your box may be made to fit into the window seat only, or made larger and deeper, as hereinafter described; if for the seat only the width may be such as to bring it nearly out to the sides of the room, say a shelf of three feet in width by fifteen inches in height. This may be made of half inch pine, with a good bottom. In this box you can place a zinc pan, with a hole in the bottom, to hold the earth, and with a good drainage; fill it with broken crock even with the top of the zinc pan, which is to be four inches in depth. Having now filled in your earth to the right depth, you can plant out quite a variety of plants, being careful not to put in too many plants or too close together. Nursing plants is one thing, and massing them another.

With such a base as you have before you you can create a beautiful exhibition of winter blossoming flowers, consisting of many varieties. On each end of your box next the window you can place some upright round pine rods, one inch in diameter, at proper distances from each other, and upon these narrow shelves small pots may be placed. These shelves may be many or few in number, according as you may desire. You can create at one end a sort of rock work, and leave small niches for prepared earth, to germinate the crocus, the cacti, oxalis, small ferns, and many interesting climbing and trailing plants. The effect of this may be enhanced by covering the rough framework of shelves with a paper, sanded and painted, to resemble rock. Small, clear pieces of granite rock, etc., can be used very effectively in this connection, but all this requires taste and study, as well as a knowledge of soils and plants. Have your shelves so constructed that they do not occupy more than six or seven inches of your box, and then you can commence the planting of your box at once. Your rock work may be, if you desire, two or three feet in height, if well constructed. Now, we suppose you will like to plant some flowers that love the sun. Suppose you try with one or two fine hardy rose bushes—say four geraniums, fine plants, different varieties, but of nearly the same size, two heliotropes, two verbenas, one daphne, and one azalia. These you well know are to be placed near the glass, and may without detriment have the full direct rays of the sun, and they will flourish if well attended to otherwise. You can also set in this box hyacinths, crocuses, etc., near the base of the shelf of rock work, and at the part having the least sun two or three good strong English violet roots, sinking the pots even with the level of the earth in your window box. If, as is the case sometimes, you have in your box case a cool recess at one side or end, then this is just the place for a well potted camelia to stand. Camelias always delight in cool, moist atmospheres, and this should be ever kept in mind.

You can grow in such a box as the one here described the calla lily, canna, marsanta, and bavardias, and among the rock work several kinds of rare and curious plants and bulbs. The striped grasses, if not too profusely used, give a pleasing effect to the corners of the rock work, while a spray or two of the variegated periwinkle will be very effective. Upon these bits of rock work, as you progress with your study, you can place several species of mosses, which will be perfectly at home in such a situation as this.

Some time since I gave a plan for the construction of quite a large window box, designed to stand within a large sized bay window, into which I introduced a sort of sub-tropical clime with good success. Among its attractive

atures was a small fernery and aquarium united together, the peculiar features of which, with the whole manner for arranging the same, will make the subject matter of another paper on the fine effects that can be produced by window plant cultivation.

We introduce the subject of aquaria and fernery united in this place to show the exceedingly valuable and indispensable requisites of water and air for all plants grown in a room, where the air is always more or less dry from the use of gas and coal fires. If you desire to place a small aquarium, of the oblong or globular form, in your box now under discussion, you can do so provided you do not make it too large of itself. Your box being three feet wide, you can so arrange your plants as to give ample space for a little rock arch of say one foot in height from the top soil of your box. Upon these supports (bits of rock cemented together with hydraulic cement, I made mine) you then place an aquarium fourteen inches long by eight wide, and ten inches in height, covering the bottom with white and colored pebbles and small shells to the depth of one inch, and you have a very nice little affair; and the best of all is, it does not cost much, and will be found a well-spring of pleasure and a source of much instruction for the younger branches of the family. Little boys and girls soon learn to love plants and flowers, and often little boys will, at sight of a little natural history toy, carry his recollections back a whole year, and name the species before him and where he last saw one of the same kind. A little boy of only two years and eight months of age, upon my presenting him with a toy turtle, arranged upon a magnetic needle, which gave it the appearance and motions of life, exclaimed, "Grandpa, I saw one in the fernery last summer."

Having your aquarium ready for the water, you will plant in the same one or two small roots or sprigs of the *vallisneria spiralis*, which easily roots itself among the pebbles at the bottom. The other water growing plants you can sparingly introduce if you choose as *confervee*, to run over the rocks in the aquarium. You can with much benefit to yourself consult the manufacturers and dealers in aquariums as to the kind of plants and fish you need, and often half an hour's talk with an intelligent man is suggestive and valuable. This digression, however, is incidentally introduced for the benefit of those who would try their hand at embellishments at this stage of the window box rather than being a part of the box arrangement we proposed at the outset for our window box, which is only a simple box with advanced improvement, our object being to lead all who are disposed to be our pupils to think and originate for themselves under our suggestions.

Some box cases I have seen made a specialty for the bulb alone, and from the centre of just such a box of earth a small granite rock arose, of the size of a peck measure, and six or eight inches in height. The hyacinths were arranged in a semi-circle around the box, the highest plants nearest the glass, and the next highest next the outer row, and so on, much care being had in the nice adjustment and harmony of color in the blooming. At the base of the little boulder in the middle were placed on each side a root of the English violet and the various kinds of crocus in all their splendid variety, from the magnificent 'cloth of gold,' the 'royal purple,' the 'Persian,' and 'ore mer' to the humble 'smelling ray.' They were intermixed with some ten or more of the tulip tribe, the low blossoming paroquets, and at the corners some few stalks of the single blooming varieties lent a charm to the whole, of which a written description fails to convey a very definite idea of the rare and beautiful treasures of a very simple and easily arranged window box. In the progress of our papers on the subject of window gardening in all its many forms and numerous adaptations to the parlor, the drawing room, and the small conservatory we shall show that it is always the safest and best path to knowledge to take the *simplest*.

Having your box all ready you can proceed to fill it with such plants as you may desire to see grow and blossom about you, but do not expect to create anything wonderful in a month or a year; but you may create a most wonderful and pleasing effect in your cozy sitting room, and though the wind and storm rage without, and a misty veil of rain or snow holds in icy thralldom the out-of-door world, all is brightness and beauty, an almost tropical clime, and the odor of sweet blossoms within.

Among the plants much loved by our lady friends will be found the well known, much used smilax, (*Medeola asparagoides*). This plant is too well known to need a particular description. Every child knows its rich, wavy, glossy foliage. It is a bulb, and originates at the Cape of Good Hope, where it grows in great abundance, requiring a rich, rather sandy, clean soil, and is not at all reluctant to drink considerable water. Its flowers are of a whitish green. The smilax easily adapts itself to almost any situation, and will grow in a not very sunny position. It is also a good plant for trailing among rock work.

OILIPOD QUILL.

THE STATE PARK.—In the message of Governor Dix, appears the following, in regard to the State Parks:—

"Near the close of the last session of the Legislature, the Commissioners of State Parks made their first annual report, in conformity to a direction 'to inquire into the expediency of providing for vesting in the State the title to the timbered regions lying within the counties of Lewis, Essex, Clinton, Franklin, St. Lawrence, Herkimer and Hamilton, and converting the same into a public Park.'

Their report contains important views and suggestions in regard to the preservation of the forests in this mountainous district for the supply of water and timber.

They came to no conclusion in regard to the main object of their inquiry, but recommend, until the question can be further considered and decided, that the wild lands now owned and held by the State be retained."

Referring our readers to a thorough examination of this most important subject, which appeared in a former number of FOREST AND STREAM, we trust that His Excellency will further the recommendation made by the Commissioners of the State Parks, and aid it by his personal and official influence.

The Kennel.

CLEANLINESS OF KENNELS.

WE shall shortly publish a description of the fox hounds of the north and south, their number, management, mode of training, feeding and breeding, compiled by the most eminent gentlemen of America. In order to lay before our readers a short description of the management of the kennel we quote from a clever writer, named R. T. Vyners. "In some kennels where strict economy or, as it should be more appropriately termed, parsimony is the order of the day, the hounds have no beds allowed them on their benches during the summer months; but it is a bad system. In the first place the kennels do not smell half so sweet as when they are allowed beds, which can be removed as often as occasion may require, nor can the vermin be kept from getting into their coats half so easily, as when there is a little straw to shake the sulphur upon, moreover, hounds by continual lying upon hard boards, not unfrequently become quite bare upon their backs and elbows which has an unsportsman-like and unsightly appearance, (where straw is too dear and precious an article to be wasted, cuttings of spruce, and scrub oak make an excellent substitute, especially the spruce, as it has a tendency to brighten the coat and keep the hounds in strong health). Ticks as well as fleas are a sad nuisance in some kennels. They are always the effect of idleness, filth and neglect, and nothing can be easier than to eradicate such pests from all sorts of kennels if the feeder will set to work in a proper manner when he first perceives the evil to break out. Pointing up all cracks and crevices to the fullest extent upon the sides and ceilings and two or three whitewashings with hot lime and water, will perfectly eradicate the intruders, provided that when the hounds again return to their sleeping kennels, their coats are free from vermin. Prevention is always better than cure; a little sulphur sprinkled upon the beds will prevent the vermin from ever breaking out again, unless the hounds are allowed to pick up ticks and fleas when shut up in strange places, or the kennels to become saturated with filth and dirt under the benches or in the remote and dark corners of the kennel. The establishing a good and free system of ventilation is a thing not half sufficiently attended to in kennels and stables." (Most of the diseases of dogs that occur we are inclined to believe may be traced to a neglect of the cleanliness of the kennel, either that or insufficient drainage. Ed.)

FOX HOUNDS OF FLORIDA.—The first fox hounds ever brought to Florida, were from a celebrated "pack" owned on the estate of the "Marquis of Berresford," in England, Sir Reginald, (subsequently Marquis) of Berresford came to America and opened extensive indigo plantations, on the bank of the St Johns river in East Florida, at a place still known as Lake Berresford, in the beginning of the last century, and like all Englishmen yearned for the most noble sport of his far off home. "Deer Stalking," as it existed in Florida, was new to him; and not being fraught with danger, lacked that tone which foxhunting alone can claim. Anglo Saxons love "fair play," as the hunter must give as much attention to saving his own neck, as he can to securing the "Brush," and the chances are sometimes decidedly against "Nimrod."

Unfortunately for the fox hound of England, the Marquis soon discovered that the fox of Florida wouldn't run half a mile before he climbed a tree, and foxhunting was abandoned reluctantly, the dog remained, however, and through neglect they rapidly mixed with the cur of the country, and the blood has become extinct. Lord Halifax then conceived the idea of importing foxes, and actually tried the experiment.

But to-day there is no dog kept in Florida for the fox-chase exclusively. We have a lively and exciting substitute, however. When we want a foxhunt we can get up very pretty sport by calling out a pack of deer hounds; we run our fox sometimes half an hour, he climbs a sapling, we overtake him and shake him out, the dogs take after him again.

We might introduce Missouri foxes, but hunting our "climbing fox" is not foxhunting at all. J. A. M.

NEW YORK, Jun. 10, 1874.

EDITOR FOREST AND STREAM:—

Having read an article in last week's FOREST AND STREAM on "Can Dogs Reason?" I will relate an incident that came under my own notice; although whether it was reason or instinct on the part of the dog, I leave you to determine.

In the fall of 1871 the Captain and I were tramping around the prairie about two miles from Fremont, Neb., and with the assistance of the Captain's pointer, "Dick," picking up a stray "chicken" every little while. A peculiar "point" of "ducks" some distance off, called our attention to him; he would make as beautiful a "point" as I ever saw, when suddenly he would throw up his head, turn it in different directions, and appear to be drawing the scent

from all around; then he would give two or three bold steps forward, but the Captain's "steady Dick," "steady" would again bring him down to a point. The best description I can give of his actions, is, that he said as plain as dog could say: "there is game here, but you need not waste your ammunition, I can attend to it if you'll let me go in," which we finally did, by going in all together on a double quick, when up went a prairie chicken, but in less time than it takes to tell it "Dick" had it fast.

On examination we found the chicken had one wing broken and one thigh badly shattered by shot, and from the condition of the wounds we judged it had been done within two days, but certainly not on the day we were out.

I've had great respect for "Dick" ever since, but I can't understand yet how he knew that bird was wounded.

LUKE TRIPP.

A BRAVE DOG.—From the Columbus *Sun* of Georgia, we take the following:—

"There are few observant ones who have been long in Columbus who have not noticed the large, intelligent, and splendid dogs belonging to Messrs. Chas. Heyman, Henry Averett, and W. R. Brown. Their progenitor has a history. At the battle of Spottsylvania Court House Mahone's division of Confederates, in which was Gen. A. R. Wright's brigade of Georgians, was charged by tremendous lines of Federals. The attacking party was repulsed with terrible loss. In front of the advancing columns was a large dog, who advanced ferociously and barking to our lines. Not a gun was pointed at him. Of all the terrible odds advancing, eleven to one, only this dog got over the Confederate breast-works, and he was captured by some members of the City Light Guard, of the Second Georgia Battalion. He was brought to Columbus, loved his Southern master better than life. His progeny embrace the smartest dogs in the country. The Yankee-southern dog died here some months ago at a good old age."

A DOG TRACING STOLEN GOODS.—At Leeds on Monday a piece of woollen cloth was stolen from a cart, and on Tuesday it was recovered, and the thief captured in a singular manner. A dog was observed pawing the ground on a piece of land attached to a bobbin manufactory, in Whitehall road, shortly after two men had left it, and the watchman employed on the premises, suspecting something was hidden, made a search, and found the cloth. The place was watched, and the thief caught in the act of searching for the cloth, and committed for trial.—*Land and Water*.

—The old-fashioned stag-hound is extremely rare; however, they possess in Florida a magnificent specimen of this nearly extinct breed of hounds, as the following from the *Tallahassee Floridan* will satisfy the most incredulous:—

"During the recent camp hunt on St. James Island by some of our citizens, an incident occurred which is perhaps without a parallel in the annals of hunting, and deserves to be recorded. A large buck, closely pursued by that famous stag-hound, Old Ring, belonging to Mr. Hopkins, took water, and headed right out to sea; the dog without hesitation boldly followed him in his voyage over the 'dark and treacherous waves.' They were watched with intense interest by the hunters until each was a mere speck upon the surface of the sea, and until they were finally and totally lost to view. After some time, when it was supposed that both dog and deer had found a watery and perhaps a bloody grave, in mortal combat, or been devoured by sharks, a small object was discovered, which proved to be old Ring returning from his long swim, much exhausted, but reaching the shore in safety. But to the greater surprise of the spectators, after a time the deer also appeared in sight, making right for shore, on reaching which he was shot down by one of the hunters."

The Horse and the Goose.

ORIGIN OF THE EXPRESSION "A WILD GOOSE CHASE."—The author of the old book entitled the "Gentleman's Recreation," published some two hundred years ago, in speaking of the manner in which horses were matched in racing in former times says that "first, then, the old way of trial was, by running so many train scents after hounds, this being found not so uncertain and more durable than hare hunting, and the advantage consisted in having the train scents laid on the earth most suitable to the nature of the horses. Now others choose to hunt the hare till such an hour was prefixed and then "to run the wild-goose chase," which because it is not known to all sportsmen, I shall explain the use and manner of it. The "wild goose chase" received its name from the manner of the flight which is made by wild geese, which is generally one after another; so that the two horses, after the running of 240 yards, had liberty, which horse soever could get the lead, to ride what ground he pleased, the hindermost horse being bound to follow him within a certain distance agreed on by the articles, or else to be whipped up by the tryers or judges, which rode by, and which ever horse could distance the other won the match. But this practice was found by experience so inhuman, and so destructive to horses, especially when two good horses were matched, for neither being able to distance the other, till both were ready to sink under their riders through weakness, oftentimes the match was fain to be drawn and left undecided, though both horses were quite ruined. This brought them to run train scents which was afterwards changed to three heats and a straight course."

—Mr. Auguste Belmont has entered two colts for the grand prize of Paris of 1875.

—At a meeting of the stockholders of the Monmouth Park Association Mr. John Hoey was elected president and Mr. D. M. Hildreth vice president; these gentlemen to appoint the stewards.

—The race meeting at Monmouth Park will commence on the 4th of July next and continue one week. The programme will be published in a few days.

THE HORSE BIT.—The question of the bit, and of the hand that rules the bit, underlies the consideration of the whole subject of man's dominion over the horse. The intelligence of man kind has hitherto invented but two principal forms of the bit; the snaffle, the simple piece of iron which lies across the mouth, subject to endless modifications, such as being twisted, jointed, and so forth; and the curb-bit, a more powerful implement, which has likewise, undergone innumerable variations.

The curb-bit is an adaptation of the principle of the lever, and the lengthening of the cheekpiece allows a very powerful pressure to be exercised upon the jaw of the horse. The snaffle is, so to say, a natural bit, and the curb an artificial one. The snaffle was used by our ancestors and by the ancient Greeks; the curb is an Asiatic invention, and was probably brought into Europe by the Moors. In the famous mosaic found at Pompeii, representing, as is supposed, a battle between the Greeks and Persians, and which, at any rate, is the picture of a battle between Europeans and Asiatics, the Eastern horsemen ride with curbs, and the Europeans with snaffles. The difference in the bit modifies the whole style of riding; and as there are two sorts of bits, so are there two quite different styles or schools of horsemanship, which may be called the eastern and the western styles.

The type of the eastern is best seen in the modern Bedouin Arab, with his short stirrups, peaked saddle, and severe bit; and the western type in its simplest form is beautifully exemplified in the Elgin marbles, where naked men bestride bare-backed horses. To ride after this fashion is an athletic exercise; the strength of the man is set against the strength of the horse with little adventitious aid. The rider restrains the horse's impetuosity by the sheer force of his arm, and he maintains a seat on his back by exercising the muscles of his legs. It is the equitation of athletes and of heroes; but it is clear that the balanced seat of the Arab, and the more complete command over his horse which follows from the greater security of his seat, would make him infinitely more formidable in war than the European, in spite of the superior strength and size of the latter.

History teaches us how the cavalry of the Saracens—small men on small horses—rode down the Christian horsemen till they learnt to ride with the bits, saddles, and lances of the Moslem cavalry. The invention of the curb-bit necessitated the stirrup, for a man sitting upon a bare-backed horse is forced to bear, at times, more or less heavily upon the bridle; and if, so riding, he were using a curb-bit, and he were to lean any part of his weight upon it, his horse would stop, or would rear, or would flinch. The ancient Greeks and Romans are believed not to have known the use of stirrups. They are, indeed said not to have been discovered till the fifth century of our era. This, if it is true, would apply only to Europe. In the east they were used many centuries before. The earliest representation of one I know is in the above mentioned mosaic, where the horse of a dismounted trooper in Oriental costume is drawn with clearly-indicated stirrups; the Greek horsemen in the mosaic are without them.—*New Quarterly Magazine.*

A HORSE TOILETTE IN ENGLAND.—To show the amount of money sometimes expended in keeping a horse stable in condition, we publish the following list, by an English saddler, of articles needed by a gentleman keeping a carriage and one horse:—

Set of single harness complete, one driving whip, carriage mats, whip socket, one loin leather, one suit horse clothing, one night rug, one roller, one pair knee caps, one set flannel bandages, one set linen bandages, one exercising bridle, one head collar, one pair head collar reins, two logs, one pair pillar reins, one singeing apparatus, lamp, one horse brush, one curry comb, one water brush, one dandy brush, two composition brushes, one oil brush, one bass broom, one inside carriage brush, one set shoe brushes, one crest brush, one brass brush, two rack chains, six rubbers, four leathers, two sponges, one mane comb, one trimming comb, one pair scissors, one dung fork, one dung shovel, one dung basket, one corn measure, one corn seive, one picker, one stopping box, one lantern, one pail, one burnisher, one setter, one oil can, one oil bottle, one scraper, one clippage machine, one hemp head and reins, and cleaning materials, viz.:—soap, oil, dye, some composition, carriage candles, blacking.

—The celebrated trotting horse Ripon Boy, died lately of hydrophobia, at Horicon, Wisconsin.

THE GOODENOUGH HORSE SHOES.—Of course there are rational and irrational methods of horse shoeing; men, as a rule, keep forever in ruts, and why should farriers be supposed to differ from the general rules governing mankind? Expert as horse shoers may be in the art of securely fastening the iron shoe to the soft and elastic pad called a horse's hoof, the grand error, the oversight, the ignorance displayed, is in the construction of the shoe itself. We may build a house of a peculiar stone, and employ the cleverest masons to place and point the stone, but if the stone be poor in quality, all the skill of the masons goes for nothing, for the house will, in time, crumble and go to pieces.

Now-a-days, fortunately, the construction of the shoe, itself, has been taken out of the hands of the blacksmith, and no end of careful study has been directed towards the construction of an iron shoe, which shall not only be lasting, but at the same time, preserve the nature and quality of the horse's foot, and we have no hesitation from actual experience in recommending the Goodenough horse shoe. In the first place, it is a light shoe, being scarcely half the weight of the old-fashioned shoe. The foot surface has the marked advantage of having a true bevel, making that portion of the web which receives the bearing of the hoof, the width of the thickness of the wall or crust. Especially now, in winter, the calking on the shoe is excellent to prevent slipping. In the ordinary method of calking, the shoe rests on three points, straining the foot so that the frog, which is unsupported, takes an unnatural proportion of the pressure. In the Goodenough shoe the calks are wisely supplied in such a way as to give a natural bearing all around. There is no possible doubt but that the Goodenough shoe not only keeps a horse more squarely on his legs, saving the rider or driver from danger, but necessarily adds to the comfort of the horse, and one immense advantage in the Goodenough shoe is, that when well put on, it is by far the most economical shoe in use.

The Magazines.

THE BEARS OF THE PYRENEES.

THE bear is a serious beast, a thorough mountaineer, curious to behold in his great coat of felted hair, yellowish or grayish in color. It seems formed for its domicile and its domicile for it. Its heavy fur is an excellent mantle against the snow. The mountaineers think it so good that they borrow it from him as often as they can, and he thinks it so good that he defends it against them to the best of his ability. He likes to live alone, and the gorges of the heights are as solitary as he wishes. The hollow trees afford him a ready-made house; as these are for the most part beeches and oaks, he finds in them at once food and shelter. For the rest, brave, prudent, and robust, he is an estimable animal; his only faults are that he eats his little ones, when he runs across them, and that he is a poor dancer.

In hunting him, they go into ambush and fire on him as he passes. Lately, in a battue, a superb female was tracked. When the foremost hunters, who were novices, saw the glitter of the little fierce eyes, and perceived the black mass descending with great strides, beating the underbrush, they forgot all of a sudden that they had guns, and kept whist behind their oak. A hundred paces further on, a brave fellow fired. The bear, which was not hit, came up on a gallop. The man, dropping his gun, slipped into a pit. Reaching the bottom, he felt of his limbs, and by some miracle found himself whole, when he saw the animal hesitating above his head, busy in examining the slope, and pressing her foot upon the stones to see if they were firm. She sniffed here and there, and looked at the man with the evident intention of paying him a visit. The pit was a well; if she reached the bottom, he must resign himself to a tête-à-tête. While the man reflected on this, and thought of the animal's teeth, the bear began to descend with infinite precaution and address, managing her precious person with great care, hanging on to the roots, slowly, but without over stumbling. She was drawing near, when the hunters came up and shot her dead.—*A Tour through the Pyrenees' Taine.*

SNAIL PRESERVES.

SNAIL dealers are not content with collecting the cork-screw individuals wherever they may happen to see them; they proceed more systematically, and keep up snail gardens or snail preserves; it is really snail culture, analogous in some degree to the oyster culture of England and France. In the Voralberg, a bit of the Tyrol that juts in like a wedge between Bavaria and Switzerland, there are regular snail gardens, intended to subserve the twofold purpose of ridding the farmers of a nuisance, and providing an article of food for such human beings as can relish it. In various parts of the canton or district, during two or three summer months, the gardens, hedges, coppices, woods, and damp places are thoroughly examined by boys and girls, who collect the snails, and deposit them in small plots of ground set apart for the purpose. Each of these plots forms a dry garden an acre or two in extent, free from trees and shrubs, and having a moat or running water all round it. The plot is covered with little heaps of twigs of the mountain pine, mixed lightly with moss; these heaps are placed at regular distances apart. The snails creep into them for shelter alike against the cold of night and the heat of mid-day sun. When this shelter is lessened by the decay of the small leaves on the twigs, the heaps are furnished up with a new supply. Every day the snails are fed with cabbage leaves and grass, receiving an extra allowance in damp weather. When harvest is over, and winter shows signs of approaching, they regularly burrow themselves in the heaps, and (figuratively speaking) tuck in snugly for the winter. The water, after flowing all round the margin of the plot, escapes by one outlet only; and at this outlet the moat is guarded by a grating. The snails often tumble into the water while crawling about their domain, or get into it somehow or other, and are carried by the stream towards the grating; this is examined every morning, and all the wanderers taken back to their garden. When the snails have sealed themselves up, they are collected for the market, packed in perforated boxes lined with straw. According to the plentifulness of the grass and cabbage crop, each plot or garden may contain from fifteen to forty thousand snails, some of which come to grief before the summer is over; but the majority are destined to the honor of appearing on the dinner-table or supper-table of the South Tyrolean inhabitants, who greatly relish them. The system is certainly a commendable one, seeing that it brings to an available market what would otherwise be a nuisance and source of loss to the husbandman.—*All the Year Round.*

TEXAS CATTLE.

IN 1872 there were four hundred and fifty thousand cattle driven overland from Western Texas to Kansas, through the Indian Territory, by Bluff Creek and Caldwell, up the famous "Chisholm trail." In 1871 as many as seven hundred thousand were driven across. The general value of "Kansas beeves" is \$13 to \$13 gold; but after deducting all expenses the average profit on the "drive" is not much more than a fair rate of interest on the money invested. But few cattle are transported by sea; the outlet for the trade by way of Indianola has never been very successful. The Morgan steamships carry perhaps 40,000 beeves yearly that way. The two great shipping points in 1872-3 were Wichita, on a branch of the Atchison, Topeka and Santa Fé Railroad, at the junction of the Arkansas and Little Arkansas Rivers; and Ellsworth, on the Kansas Pacific Railroad. The whole country, at the time of transit, is covered with vast herds which begin to arrive in Kansas early in May and await buyers there. A stampede is something which baffles description; you must witness it. It is a tempest of horns and tails, a thunder of hoofs, a lightning of wild eyes; I can describe it no better. Merely to see a man on foot is sometimes sufficient to set the average Texan cattle into a frenzy of fear, and a speedy stampede; for the great majority of them have never been approached save by men on horseback. The gathering up of stock is no small task, as a herd of seventy-five thousand cattle will range over an area fifty miles wide by a hundred miles long. Large stock-raisers are always increasing their stock by buying herds adjacent to their ranges. Many persons make fortunes by simply gathering up and branding the cattle which the rightful owners have neglected to brand.—*Scribner's Monthly.*

New Publications.

[Publications sent to this office, treating upon subjects that come within the scope of the paper, will receive special attention. The receipt of all books delivered at our Editorial Rooms will be promptly acknowledged in the next issue. Publishers will confer a favor by promptly advising us of any omission in this respect. Prices of books inserted when desired.]

ARTISTS AND ARABS. By Henry Blackburn. Author of "Picturesque Normandy." Illustrated. 18mo. Red edges. \$1 50. Boston: J. R. Osgood & Co.

This is a finely illustrated little work, and comprises the jottings of the author as he passed through the several places of which he so pleasantly speaks. His style reminds us somewhat of Bayard Taylor's manner of conversation. The initial chapter opens with the author "on the wing." The art season being on the wane in London, he commences his journey from the Tweed to the Shetland Isles, over the hills and amid all the beauties of nature, as unfolded to his artistic eye in a mild July day. Being one of a sketching party of two, our friend Blackburn has fully illustrated his travels with graphic sketches of his picturesque tour among what he tritely calls "Artists and Arabs," and well has he acquitted himself in the work before us. We can only recommend this work to our friends; we would much like to tell them more about it, to speak in detail of Algiers, The Moorish Quarters, Our Studio, Models, Our Life School, The Bouzareah, A Storm, and the many other highly interesting illustrated papers, but we forbear.

ANNOUNCEMENTS.

THE DAYS OF MY YOUTH. By Amelia B. Edwards. author of the "Vagabond Heroine," &c. Phila.: Porter & Coates.

BOOK OF STANDARD FAIRY TALES. Illustrated with ten full pages of engravings after designs by Dore and Craikstanks. 12 mo. \$1 50. Phila.: Porter & Coates.

THE ILLUSTRATED BOOK OF DOMESTIC POULTRY. With twenty chromo illustrations, etc. By Martin Doyle. Brown, 8vo. \$4 50. Phila.: Porter & Coates.

TEN NIGHTS IN A BAR-ROOM. By T. S. Arthur. Illustrated edition. Cloth, extra, \$1 25. Phila.: Porter & Coates.

HISTORY OF PORTSMOUTH, N. H. In two series, each a complete work in itself. By Chas. W. Brewster, a pleasant, reliable, correct historian. Portsmouth, N. H.: Louis W. Brewster.

THE HOUSEKEEPER'S MANUAL. By Catharine E. Beecher and Harriet Beecher Stowe. Illustrated. N. Y.: Pub. By J. B. Ford & Co.

LIBRARY OF POETRY AND SONG. Being selections from the best poets. Illustrated. With an introduction. By W. C. Bryant. New York: J. B. Ford & Co.

THE MONEY MAKER; OR THE MYSTERIES OF THE BASILISK. Illustrated. Price \$1 50. Boston: Lee & Shepard. Also Prof. J. De Mille's new book, "The Winged Lion." \$1 50. Lee & Shepard.

From Scribner, Armstrong & Co. we have three books differing very materially in character, yet each may be called a pronounced book. Each is a good book in its own peculiar department. First, we have from the prolific pen of Jules Verne, a favorite "Trip from the Earth to the Moon;" then we have "Diamonds and Precious Stones" a translation from the French of Louis Dienlafait, telling us all about gems and their wonderful interesting history; worth twice the price named for it. Thirdly, the remarkable history of Stanley's, called "My Kalluber." This is the famous traveller, who says he "found Living stone," and Kallube was to him as the man Friday was to Robinson Crusoe. At first we thought it a book for mature reading, but we think it better designed for a younger class of our readers. We shall notice in their appropriate places all the above books. These notes will be continued, giving short outlines of new publications from time to time as books are received from the publishers for notice.

Answers To Correspondents.

[We shall endeavor in this department to impart and hope to receive such information as may be of service to amateur and professional sportsmen. We will cheerfully answer all reasonable questions that fall within the scope of this paper, designating localities for good hunting, fishing, and trapping, and giving advice and instructions as to outfits, implements, routes, distances, seasons, expenses, remedies, traits, species governing rules, etc. All branches of the sportsman's craft will receive attention. Anonymous Communications not Noticed.]

F. B., Broad street.—Have sent to Nebraska for information.

O. H. HAMPTON.—You must shoot off ties at 23 yards.

Dr. G. F. H., Hartford.—You can have the guarantee of Mr. Price, the owner of the champion pointer of England. Do you require an imported dog or bitch?

AQUARIUM. Two fish are enough for one gallon of water, particularly in warm weather. During the winter one or two more may be added to the number; a few aquatic plants should be kept in an aquarium at all times, and receive plenty of light. When plants are first put in, it should remain a few days before the fish are put in so the water will have time to purify and clear itself.

ALLEGHANY, Pittsburgh.—Order one of the best grade 28-inch, 10 bore. Try it every way, especially for penetration and pattern and report. If you are satisfied with the one they send you, then order the proper crook in the stock for your friends and suggest any alterations you may see fit.

EXCHANGE.—One of our most valuable correspondents wishes to exchange a complete set of the Medical and Surgical History of the War, got up by the Government at great expense. These volumes are scarce and very valuable. Any physician having a setter dog to dispose of can make an exchange on terms.

MASTIFF, Baltimore.—I have a valuable mastiff; he is looking quite thin and sick; see the cause in my letter. Ans. Mix the following and give two tablespoonfuls every time: Prepared chalk, 2 to 3 drachms; aromatic confection, 1 drachm; laudanum, 3 to 8 drachms; powder of gum arabic, 2 drachms; water, 7 ounces.

UNDER LEVER, New York.—1st. What barrels are best for breech-loaders, Damascus or laminated steel? Ans. Damascus iron of the very best quality; but there is some made by unprincipled persons which on the surface presents the Damascus pattern without extending any deeper. 2d. Do you consider Hazard's No. 2 duck shooting powder coarse enough for a fine 7 lb., 12 bore, 28 in. laminated steel barrel breech-loader? Ans. We don't understand the question; coarse enough to do what? 3d. Why does not a pin fire gun shoot as good and as strong as a central fire? Ans. Each system has its advocates, but the almost universal use of the central fire by sportsmen has never given a practical solution to the question of preference. By reason of the central ignition better shooting is done.

J. N. W., St. John, N. B.—I have often shot birds in the Bahamas, called by the negroes, Gaudings. Can you please inform me of what species they are? Their habits are something as follows: It flies about lagoons and mangrove bushes towards evening; I never found them about in day time; of grayish color and about the size of a partridge; head like a hen's; I found them always alone; will send a sketch about them sometime; they give fair sport, and I have often knocked them over on the wing; I often used to shoot wading from one little island to another, with water from six inches to three feet deep and a broiling sun overhead; have gone shooting in Jamaica with the thermometer at 130. Ans. Probably the Mangrove Hen, *Rallus longirostris*, resembling a pullet, which is mentioned by Gosse, Naturalist's Sojourn in Jamaica, 1851, p. 247.

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INSTRUCTION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Company,

103 FULTON STREET, NEW YORK.

Terms, Five Dollars a Year, Strictly in Advance.

A discount of twenty per cent. for five copies and upwards. Any person sending us two subscriptions and Ten Dollars will receive a copy of Hallock's "Fishing Tourist," postage free.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices, 50 cents per line. Advertisements in double column 25 per cent. extra. Where advertisements are inserted over 1 month, a discount of 10 per cent. will be made; over three months, 20 per cent; over six months, 30 per cent.

NEW YORK, THURSDAY, JAN. 15, 1874.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal letters only, to the Manager.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited. We cannot promise to return rejected manuscripts.

Ladies are especially invited to use our columns, which will be prepared with careful reference to their perusal and instruction.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

CHARLES HALLOCK,
Managing Editor.

OUR FLORIDA EXPEDITION.

JUST as we had begun to bemoan the probable loss of our FOREST AND STREAM Commissioner at the bottom of the deep blue sea, we were gladdened by the announcement of his safe arrival at Mosquito Inlet, Indian River, and two days subsequently at New Smyrna, Florida, after a tedious passage of twenty-five days from Barnstable, Mass., in a coasting vessel. We give a brief extract from his hurriedly written note:—

"Will not trouble you with details of my cruise, of the beating about in the gulf stream for nearly two weeks, while my soul was sickening at the thought of the precious days going, gone forever! I am filled with wrath and disgust unutterable, but shall try and make up for lost time. Shall commence to gather and hoard away all information upon the various species of birds, quadrupeds, fishes, &c., for your use in special columns another season. The Florida papers are making very favorable mention of our expedition, and the "Floridian" speaks of it as a great undertaking. Expect to reach St. Lucie in ten days."

St. Lucie will be the headquarters of our correspondent. Thence he will penetrate to and explore regions almost inaccessible, including Lake Ochechobee, of which latter he has already written extensively and minutely in these columns. These investigations will continue until April, and be aided by all necessary attendants and apparatus. He has two boats, tents, two men, the complete ordinary outfit of a sportsman, photographic apparatus, with 100 negatives, and a stock of artist's materials—all of which were taken with him from New England—and also an Indian and native Florida guide, with swamp ponies, etc. His labors include commissions to collect specimens of Natural History and Indian relics for the Smithsonian and other scientific institutions. Altogether, the expedition is fitted out at considerable expense, and for the object sought to be accomplished, will prove itself eventually of considerable importance, and attach some credit to the enterprise of FOREST AND STREAM, under whose auspices alone it has been instituted. Both government and private enterprise have essayed explorations from time to time into the interior of Florida, but the information gained has been so far of little practical value or benefit, even when most needed, as it was during the seven years' Seminole War. How frequently we shall be able to hear from our correspondent, we cannot say, as there will be intervals of time when access to mail facilities will be impossible. However, the material furnished will be voluminous in the aggregate. He will write over the signature of "Fred. Beverly."

THE ANGLO-AMERICAN CHALLENGE—THE COMING POINTER AND SETTER FIELD TRIALS.

THE interest taken by our gentlemen sportsmen, owners of pointers and setters, in regard to the challenge published *exclusively* in the FOREST AND STREAM and addressed to *ourselves and to no one else*, by Mr. R. L. Price and the Rev. J. Cumming Macdonald, is unabated. We are assured that the challenge will be accepted by some of our most distinguished sportsmen who are pleased with the liberal and fair manner in which the challenge is worded. These gentlemen having been convinced by us that it would be better for all parties concerned to withhold their names from publication until the precise rules and regulations governing such field trials are published, sportsmen will kindly wait patiently until we shall receive the information, by which they may be governed as to the nature of the contest. It would be perfectly within our capabilities to print sundry laws on English field trials, but as we have every reason to know that they are not those which will be enforced for 1874, by producing them in our columns we might only confuse our readers. We trust in our next issue to be able to publish the revised code, as some slight changes have been made since the last field trials.

It may be well for us to state at once that we can enter into no discussion in regard to the character of the field trial matches on the other side of the water, not having been present on the ground. One thing is certain, however, that once engaged in the contest, according to the English rules, we must abide by their laws. We feel very certain, from the high character of the gentlemen who will engage in this interesting contest, that everything will be arranged in the most pleasant manner, no matter which country wins.

One point especially worth mentioning in regard to Mr. Price's challenge and which may have escaped the notice of those not familiar with English cover shooting is, that Mr. Price purposes the use of ground in one of the wildest parts of Wales. This shows not only great courtesy, but liberality on the part of the challengers, because the Englishman with his dogs, especially trained and broken for open shooting in the "stubble" and turnep fields, would undoubtedly beat any American bred dogs, not accustomed to this kind of shooting. Bala is in the county of Merioneth, North Wales, where is situated the beautiful lake named Bala; it is some four miles long by one in breadth, the property of Sir Watkin W. Wynn, Bart, and it is this gentleman who has kindly consented to lend his grounds and game for the Anglo-American field trial matches. The face of the country closely resembles the northern portions of the State of Pennsylvania, as parts of Wynnstay are sterile, barren and rocky with a low undergrowth, not unlike that found in the counties of Elk and McKean.

When these interesting trials which have been placed *exclusively* in our hands by Mr. R. L. Price and the Rev. J. Cumming Macdonald are fully arranged, and everything known in regard to them by the gentlemen who on our side are now desirous of taking up the challenge, we shall publish the same in the fullest details. As acting for our American friends and English sportsmen, we intend to be most careful and circumspect in regard to it, and will take no step that will militate for or against either party, we think this proper caution will be applauded in the end. We might, if we pleased, say a great deal of the preliminary business of this challenge, the same having been already arranged *by us* in our office, but we refrain from doing so, for the reasons before distinctly stated.

THE GLOUCESTER FISHERMEN.

TENNYSON'S In Memoriam, the most mournful poem of the century, devoted as it is to recording the loss of a cherished friend, is hardly more elegiac in character, nor causes greater sadness than the reading of the plain prose which, in The Fishermen's Memorial or Record Book, tells of those brave men who in the pursuit of their dangerous calling, have been engulfed in the seas which surge along our northern coast.

The little bark leaves the port, glides on the quiet seas, just ruffled by the breeze, and no one scarce heeds the departure. She is absent for a week or month, then away across the headland she appears again. The watchful eye of the wife, the mother, the daughter knows the vessel, though to you she seems but as a mere speck on the ocean. The vessel nears the shore. "Thank God," cry the poor women folk; "they, our husbands, our fathers, our brothers, have escaped the perils of the Georges or the Banks." Now the craft is better discerned, but her flag, that poor little bit of ragged bunting, where is it? It droops at half mast! Some one who trod that deck, who sprang once as lithe as lithe could be up the rattlines, who threw the hook, or worked the dorey, or the trawl, is no more, and has been lost at sea.

"Who shall the mourners be,
That soon must weep sad tears for him
They never more must see?"

Mr. George H. Proctor's book, the Fishermen's Memorial and Record Book, written in Gloucester, the headquarters of the Massachusetts fishermen, gives to us matter of the most interesting character. People read habitually of the dangers of the fisherman's life, and hardly appreciate it until the sad facts are brought before their eyes. From 1830 to 1873 sailing from this single port of Gloucester, 1,437 men have lost their lives in their vocation of fishing, and 286 vessels have foundered. Every winter month has its vicissitudes, but of all of them the February gale of

1862 was the most terrible. On Monday evening, February 24th, says Mr. Proctor, "a terrible gale from the north-west suddenly burst upon the fishing fleet on Georges, when there were about seventy sail at anchor very near each other. In this gale one hundred and sixty-two men and nineteen vessels were lost." The storm of 1871 was almost equally disastrous, 140 souls having perished with nineteen vessels. This past year has not been without its vicissitudes; from January to July 1, forty-one lives and twelve vessels have been lost from Gloucester alone.

The great danger arises from causes which may be explained as follows: The vessels following closely one another, all flock to one place, and if the fishing is good they anchor there. The wind howls, the snow comes down like a pall, and the sea rises. The vessels try to ride out the storm at anchor, a craft loses her anchor or her cable parts, and away she goes with fearful speed. If she then strike another fishing vessel, the doom of both is sealed, there is not the slightest hope; there is a crash heard for an instant amid the mutterings of the storm, and the two vessels with their crews find a watery grave. One who was in the fearful storm of 1862, tells the story of the danger: "The darkness was impenetrable, and a more dismal night I never passed. Once in a while the storm would lull; then we could see the lights of the fleet, but this was not often. The hours passed heavily along; they are indelibly impressed on my memory, and will not be effaced until death claims me. During the night, a large vessel passed quite near us. We could see her lights, her spars and sails, as she sped swiftly along on the wings of the storm. Glad enough were we to have her pass us, and I trembled at the thought of our fate had she struck our little craft. The morning at last breaks, when the skipper cried out, 'There is a vessel adrift right ahead of us!' On she came. The drifting vessel was coming directly for us; a moment more and the signal to cut our own hawser must be given. With the swiftness of a gull she passed us, so near that I could have leaped aboard, just clearing us, and we were saved from danger. We watched the doomed craft as she sped on her cruise. She struck one of the fleet a short distance astern, and we saw the waters close over both vessels. Almost as we gazed, they both disappeared. Then we knew that two vessels of the fleet would never return to port."

Another great danger is that which the dorymen undergo. In visiting their trawls, launching their frail boats, the fishermen are often lost during the fogs which enshroud them. "The chances of a man thus adrift on the seas are small," Mr. Proctor states, "and that the majority of those who get estrayed from their vessel pay the penalty with their lives." Our authority advises, in order to lessen dangers of this character, that each dory should be provided with sufficient food and water to sustain life for several days.

Leaving these sadder incidents of the fishermen's life, from the Memorial Book one can gather a great deal of information in regard to the various fish sought for, and their methods of capture. Mackerel were first caught about 1812 with a bare hook, when in 1816 one Abraham Lurrey discovered a method of running lead around the hook, and invented the jig. Small lines and fly lines only came into use in 1823. Bait mills were not used until 1820; before that time the fishermen's heels ground up the bait. From the dozen jiggers of 1812, small and poor craft, sprang the fleet of two hundred clipper schooners used by Gloucester in the mackerel fisheries of to-day.

Cod fishing was first practically tested in 1821 in the Bay of St. Lawrence by our Gloucester folk. At first to anchor on the Banks to fish was thought to be fraught with danger. Brave old salts thought the current would drag their vessels under water, and it was only in '21 that they found out how to fish when at anchor on the Georges. But this important branch of fishery only became a permanent business in 1835 or '36, when halibut was added to cod. In 1846 more halibut were caught than codfish; now it is the reverse. It is not only on our own coasts that our hardy fishermen gain their bread. Sometime ago the FOREST AND STREAM recorded the fishing adventures of some of our enterprising Gloucester fishermen on the coasts of Greenland and Iceland. In 1872 six vessels were engaged in the business, and made successful trips to Iceland. But last year arriving at a bad season of the year, our fishermen had poor luck.

The profits derived from these fishing enterprises are quite remarkable. A Grand Banker averages nine trips in a year, and the trips vary from \$8,000 to \$17,000, \$12,000 being about the average. All depends upon hitting the right market, (see our article in last number on the German sea fishing.) Some of the exceptional trips and money results are worthy of mention. In 1866 with a season's fishing on the Banks a schooner made \$22,000. In 1871 a schooner on a single trip sold her catch of cod and halibut for \$5,361, each of her crew making \$213. Time occupied in making the trip, five weeks. In mackerel fishing the money made is sometimes even larger. In 1865 a schooner absent about five months made a net stock amounting to \$13,728. The cook's share was \$582. The gross receipts from fish sold are called the stock. The men who sail the vessels, who reap the harvests of the sea to day, are quite different from those of only twenty-five years ago. Then the fishermen were mostly native born. To-day there is a large admixture of hands coming from the Provincial waters. Between the two styles of vessel, those from the United States and from the Provinces, there was a marked difference. The former sailed a clipper-built and well appointed craft, the later had only clumsy vessels, and were far be-

hind the American vessels in improvements and fittings. The provisioning of the men was also much better on the Yankee crafts. All this led the Nova Scotia men to seek employment on board of our vessels, and a great proportion of these men number to-day among the most thriving and energetic of our Gloucester citizens. The Portuguese too form no small percentage of our northern fishermen. They are natives of the Western Islands, are quite clannish, devout Catholics, and are prudent and industrious. Then, too, comes a sprinkling of those rovers of the sea, the Swedes and Norwegians, and the Danes and Finns, who soon merge their nationality into that of the universal Yankee fishermen, and when sailing into our harbors, forget their fjords and estuaries.

The enterprise of a single fishing town of Massachusetts, Gloucester, which represented in 1872 no less than \$3,414.325 as the result of its fishing industry, is worth recording, and evidence of material success is shown, when last year the increase of tonnage was 16,982 tons over that of the previous year. For these and many other interesting facts recorded by us, we are indebted to Mr. Proctor's Book of Gloucester fishermen.

THE PHILADELPHIA ZOOLOGICAL SOCIETY.

THERE is every reason to suppose that under later energetic management, this most commendable enterprise, the Zoölogical Society, of Philadelphia, will shortly be put in thorough working order, and that before six months are over, the elegant grounds, especially planned for the exhibition and study of wild animals and rare birds will be thrown open to the public.

Zoölogical collections are from the nature of things, among the most difficult to manage, and any idea of arriving at even a moderate degree of perfection, before a long series of years have elapsed, is almost impossible. Such institutions are necessarily of very slow growth, and require at the outset a large capital and constant care.

It may be positively asserted that prior to the organization of this Zoölogical Society in our sister city, there never has been conceived in the United States a plan for the collection or exhibition of animals in any respect equal to those originated abroad. Our own Zoölogical department at the Park, though quite good of its kind, and reflecting great credit on its most intelligent director Mr. Conklin, occupies but a second or third position in the Park itself. Instead of being the prominent feature, an institution by itself, it is simply subsidiary, an adjunct to the Park; and in one of the late reports of the Park Commissioners, the Commissioners themselves stated, substantially, the impossibility of giving the Menagerie greater prominence without interfering with some of the main features of the Park itself. In fact, as was fully appreciated by Messrs. Vaux and Olmstead, to construct and carry out a Park, such as our Central Park, is one thing, and to manage and develop a Zoölogical collection quite another, and that, to build up and manage one alone well, was sufficient occupation for any single board of officers.

Zoölogical collections and the results to be derived from them, are very much more complex than they were thirty years ago. If public curiosity alone was to be gratified, a circus show might suffice. Opportunities for study in all the branches of comparative Natural History must be afforded, and in addition, certain utilitarian claims must be attended to. Acclimatization, how to take animals coming from other countries, and to adapt them to our own purposes and uses, must be thought of. We are only too pleased to state that it is exactly with such ideas, to advance science and to utilize nature's resources, that the Philadelphia Society has been founded.

From the Commissioners of the Fairmount Park, the Philadelphia Society have obtained thirty-five acres of ground at the Thirty-Fifth Street entrance of the Philadelphia Park, and they are now improving ten acres of this space by laying it out and constructing walks, buildings, cages, houses, and preparing for the proposed collection of the Society.

Of course the expense of an undertaking of this character is great; but it is believed that the necessary means to accomplish the object proposed, can readily be obtained. With one hundred and fifty thousand dollars, the Society will be enabled to place the Garden upon a solid and permanent basis, and permit it to be opened to the public in the spring of this year. We think that little anxiety should be felt by the management as to its success, as there has never been a Zoölogical Society of any merit founded in a large city, where the receipts did not exceed the expenditures. Such has been the example furnished in London, Paris, Berlin, Bremen, Vienna, and Amsterdam. In London, alone, 600,000 persons visited the "Zoo" last year.

When the Centennial Exhibition draws to Philadelphia the whole people of the United States, few will fail to visit the Zoölogical collection.

To show that a commencement has been made, the Superintendent of the Garden is now in the Cape of Good Hope, and will return by the way of Calcutta with a ship load of curiosities for the Society, and to-day the donations of animals of our own country destined for the Philadelphia Zoölogical Society are largely in excess of the present accommodations. One excellent feature of the Society, and which we trust will be carried out, will be to inaugurate a course of lectures, with publications by the Society, which will make the Garden not only a source of amusement but of education.

To start such an enterprise, and keep the collecting

grounds in a thoroughly perfect order, the Society, though not soliciting pecuniary donations, would be happy to receive them. What they ask is that persons interested in such subjects should subscribe to the stock, which with every prospect of success, would seem to be able to earn readily a dividend of six per cent, in cash, per annum, besides giving to the holder of such stock a certain number of free admissions. For each fifty dollars of stock a subscriber is to receive five single admission tickets worth twenty-five cents each, in addition to six per cent., or in place of these tickets an annual ticket for every two hundred dollars subscribed, admitting at all times during the year, any person the stockholder may name.

The plan of the Garden submitted to our notice, seems to be clearly conceived in every way, and with ample room and accommodation for all the birds and beasts, and with aquaria for the fish.

We trust that some of our citizens will aid our Philadelphia friends in their efforts, in a work which must reflect credit on the whole country.

That a commencement has been made, is very certain; for, but yesterday, we saw the following from an exchange:—

"A car load of wild animals from the Rocky Mountains, for the Zoölogical Gardens of Philadelphia, arrived at Omaha Saturday."

The management is composed of Dr. W. Camac, President; James C. Hand, Esq., and J. G. Fell, Esq., Vice-Presidents; F. H. Clark, Esq., Treasurer; John J. Ridgway, Esq., and Dr. J. L. Leconte, are the Secretaries; and among the managers we see the names of such well-known Philadelphians, of Messrs. Graff, Vaux, Wistar, Childs, and Drexel.

A NEW WAY TO COLLECT DEBTS.

THAT our American Indian is endowed with a peculiar originality, even his most bitter enemies must allow. Civilized man when he sheds blood, does it in an approved manner, undoubtedly owing to that superior culture acquired by years of patient practice. If the Spanish Volunteer, naturally excited by the contest, after wounding the Cuban rebel, jabs his bayonet through and through his fallen foe, there are precedents for such things; but for the Comanche to plunge an ugly butcher knife into one's vitals, and then to end the performance by a thorough yet curious tonsorial process, shows in the Indian a fine perception of the *bizarre*, which is unique in character.

It is by no means the aboriginal male alone who has these idiosyncracies. The squaw has quite as much originality as the brave. A number of bonnets having been sent out to the female portion of a tribe, and the Ottoo ladies, not knowing how to wear them, is not to be judged as showing any peculiarities of the kind we would describe, nor the fact of their having had the bonnets put on their heads properly by their more intelligent white sister, and when the bonnet got displaced, the perfect inability on the part of the Ottoo squaws to determine which was the front or which was the back of it.

There comes to us from California a most curious and original method of collecting debts, practiced by the red-skin there, which is wonderfully suggestive. To dun is brutal. Everybody knows that, and has felt the humiliation of dunning or being dunned. The Indian, desirous of collecting his small bill, has too much dignity, is too high-toned a gentleman, with his native nobility, to bother the debtor for his small balance of account. Oh tailors and bootmakers! what an example there is for you to be taken from the much despised savage!

Pey-yoh-gash or the "Lone Hand," is indebted to Hey-ya-mush or "Nimble Fingers," to the amount of seven beaver skins and a deer hide. The Lone Hand is slow of payment. What does Hey-ya-mush do? He simply prepares a stick—not to wail his debtor with—but a little stick. He decorates this stick in a peculiar way, paints a ring or so of gaudy color round it at each end, then he carries it, and tosses it without uttering a syllable into his debtor's wigwam, simply as a gentle reminder. The delinquent Indian sees it, is struck with remorse, takes the hint, and getting together the peltries, liquidates his debt on the spot. Strange people! It is a terrible stigma on any Indian to have these sticks cast up before him, and it is rarely ever resorted to.

Fancy such a method employed for the collection of debts with us. Why it seems to us that it would be almost an incentive to get over head and ears in debt. The weather, say, is cold, and a man owes money pretty generally all around. His creditors might commence by pitching in to his house logs of wood, as reminders, until he had acquired a measured cord of sound hickory logs for his drawing-room fire, with no end of kindling material for the kitchen; enough fuel in fact to keep himself warm with for the rigors of the whole winter season, and still leave his debts unpaid.

Certainly we have not the nobility of the Indian. Nor would we advise at least in New York, that parties about the first of the year, who are owed money, should imitate the savage. Very certainly, if they did, the debt to the wood yards would be very heavy and the price of coal would rapidly decline.

—A pack of wolves in Sherbourne County, Minnesota, chased a couple of lawyers five miles, and the New Orleans *Republican* thinks it showed a lack of professional courtesy.

OUR LADY SPORTSMEN.

IT is gratifying to note the growing interest taken in out-door recreation by our ladies. FOREST AND STREAM has no less than six upon its list of contributors, and two of these write as intelligibly of the art of fly-fishing as do the gentlemen experts themselves. We count among our female acquaintances many who handle a pair of sculls most deftly, and there is the wife of a certain clergyman, himself famous as a student of Nature, who is equally handy with rod, gun, and oar, besides being a masterly whip. Another lady who is now dead, the wife of an accomplished author and journalist, spent several years upon the Nile in company with her husband, and became noted among the boatmen all along the river as an extraordinary pistol shot. She used to hit birds on the wing with her ivory-handled revolver. One summer's day, a year ago, a gentleman of our acquaintance bantered a married lady to shoot a pistol, and put up his felt hat at twenty paces, expecting a little shriek when the report followed. The next day he was looking over a hatter's collection, and mournfully exhibiting his own tile with seven bullet holes in it. Equestrianism is a more common accomplishment, while archery is indulged in by ladies in many localities. Of accomplished lady skaters there is no end. Nothing is more charming than a lady suitably attired for the proper and untrammelled enjoyment of these out-door pastimes, her cheeks rosy with the exercise, and her movements as lithe and agile as a fawn's. Many ladies of the Blooming Grove Park Association two years ago adopted the practice of wearing what they call "mountain suits," which are made of bloomer trousers, a blouse belted at the waist, high boots, and felt hat or jaunty velvet cap with plume. We have seen certain ladies among the Adirondacks that wore very becoming plaids, with leathern waist belt. In dresses of this description the limbs have full play. Briars and brambles get little hold; flowing skirts do not impede locomotion. Some weeks since some of our lady friends wrote for this paper some designs for out-door costumes, and when summer comes again we shall urge their adoption by our fair readers.

Herewith we publish a very fresh and breezy letter from a lady in Indiana, which ought to make our languid city belles sick with envy, or at least prompt their aspirations and emulation. We wish our lady readers would oblige us with their fishing, boating, and shooting experiences, whatever they may be. The records of some, we feel, would put those of what are termed "lords of creation" to blush:—

EDITOR FOREST AND STREAM:—

You extend a kind invitation to ladies to write for FOREST AND STREAM. But what can *we* say that will do for the pages of a paper that seems almost entirely devoted to sports pertaining to stream, field, and woodland? Generally speaking, we are not "much" as huntresses, and no great adepts in the art piscatorial.

I had not thought I could care at all for a publication so essentially belonging to the "lords of creation," yet I find myself strangely interested in almost every article. There is so much fresh, out-door *breeziness* about them as to make even us domestic goddesses long to desert our pedestals in the kitchen and roam over the hills and down the dales, free as the wild winds around us.

How delightful the "Autumn in Nova Scotia!" and I trudged around after Fred Beverly through the swamps and glades of Florida with a deal of enjoyment. Then the boating, shooting, and fishing—especially the black bass fishing in the Maumee—for haven't I waded the "rifles" of that dear old stream many a time in the days of my childhood, when the water rippled low over its rocky bed! And when it got higher have coasted along the shore on "slabs" (got more than one ducking, too,) and rowed a light skiff from shore to shore times without number. I remember how jubilant I was, and how I crowed over winning a race, fairly and squarely, against a "chunk" of a boy who bantered me for a row across the river. We each had a skiff, light as a feather almost. The "Bald Eagle" was the name of mine, and really it was worthy of the name, for it skimmed over the sparkling waters like a bird, and I experienced a thrill of delight as the prow touched the grassy bank and I sprang lightly out, while my rival was still a full boat's length behind. It is needless to say "he wer' mad," and hurried off home to hide his head in his mother's apron, I guess.

"Pretty business" (do I hear you say), "Miss Prim, for a twelve-year-old girl to be engaged in! Better be in the house learning to knit and sew than being such a romp!" Yes'm, I have no doubt, and I feel awful sorry I *was* such a Tom-boy. I suppose it was only because we were born to be hung that whole swarms of us little Miltonvillains were not drowned outright. But I often wonder if I do not, in a great measure, owe the grand good health I have enjoyed all my life to the boating exercise of those long days ago.

Wayne county, Indiana, January, 1874.

—PORTRAIT OF "BELLE."—The pair of portraits of "Belle," champion pointer of England, will positively be ready for mailing on January 20th. We have to apologize to our subscribers and friends for the delay. There has been considerable difficulty in obtaining an artist who is accustomed to draw highly bred pointers, and the rainy weather has been much against us.

—Can the Grangers be politically honest if they have oats to sell?

CREEDMOOR.

MATCH OF THE NATIONAL RIFLE ASSOCIATION
—OCTOBER 1873.

COMPETITION III AND IV.

COMPETITION III—FIRST DIVISION MATCH.

Open to "teams" of twelve from each regiment and battalion in the First Division of the National Guard, S. N. Y. All competitors to appear in uniform (full dress or fatigue), and to be certified by their Regimental Commander to be regularly enlisted members in good standing of the regiment they represent, and to have been such on August 1, 1873, as required for the State Prize. Weapon, Remington Rifle, State model; distance, 200 and 500 yards; five shots each distance; position, standing at 200 yards; any position at 500 yards.

Hamburg, in regard to their naturalistic studies and researches. Emulating the Medici, who were not only the greatest of merchant princes, but learned in all things, and judicious collectors, the Messrs. Godeffroy, an extensive mercantile and shipping house, divide their attention between business and natural history. These merchants have for some years employed scientific men in various parts of the Pacific who have collected and prepared for them many unique specimens for their well known scientific institution, the "Museum Godeffroy." In this museum may be found that wonderful collection of birds which furnished the material for Doctors Finsch's and Hartlaub's "Birds of Central Polynesia," published some years ago. A work on the Polynesian fishes has just been issued, due to the same Godeffroy collection. The work is described to be one of the most perfect ichthyological monographs ever issued.

OBITUARY.—Died at Long Lake, Hamilton county, New York, on Wednesday, 17th ult., John D. Sabattis, for many years one of the most favorably known of the Adirondack guides. A correspondent, who knew Sabattis better than we, although we knew him well, writes:—

"Sabattis had many friends among your subscribers and men who may have expected to secure his services as a guide in the future. He was a young man for whom I had great esteem, and with whom I have loitered many happy days among the mountains and on the lakes of the North Woods. Among the guides of my acquaintance he was the chief, and I cannot express too highly my appreciation of his qualities as a sportsman and guide, or the loss to his friends. He was a true sportsman, a conservator of the fish and game, and I fear that his influence and example will be greatly needed among the men who are killing off the game and fish along the Racquette for the markets."

—Future Australian travel will undoubtedly be undertaken with camels. The native Australian seems to have an instinctive dread of the camel, and supposes him to be a kangaroo of gigantic size, who is only too ready to make a leap of a hundred yards and to devour him. Indifferent as the Bushmen are to horses and cattle, they take to their heels on seeing a camel. Major Warburton, who has just started on an extended exploration into the interior of the Australian continent, has abandoned horses and taken with him sixteen of the vessels of Sahara. The camel would seem peculiarly adapted for travel in Australia, where water is scarce, and in many places the only things edible for stock are thorns and prickly shrubs.

Fish Culture.

—The extraordinary mild weather of the winter, we fear, will have caused the ova of trout and salmon to hatch prematurely, and the freshets to sweep off the eggs or cover them with silt to an extent that will destroy them. Even the minnows and "wrigglers," and all small fry generally, that cannot find refuge in lateral harbors and places of refuge, will be carried down stream and leave the larders of the grown fish empty. So that pisciculturists who, perchance, may not find their anticipations realized this season must not predicate their want of success upon the supposition of misapplied theories. In view of the efforts now being made by the United States Fish Commission to plant and acclimate Pacific salmon and other varieties of food and game fish in our Eastern waters, we regard the present meteorological conditions of earth, air, and water as extremely unfortunate.

By the way, and not exactly in this connection, observant anglers will notice how ravenously great trout rise to feed, just upon the subsidence of a freshet. It is of no use to waste time while the flood is rising, but try their voracity just upon the turn.

ANGLERS' ASSOCIATION.—The Anglers' Association held a meeting in Boston Thursday evening, January 8th, in Codman Hall, at which the President, Dr. John P. Ordway, occupied the chair.

The committee on the preservation of lobsters asked, and were granted, further time for their investigations.

The committee on spawning beds reported that smelts were in the market, and that they were of an inferior and sickly quality, and, as supposed, were received from Newburyport. The report of the committee also stated that it was suspected that the spawning beds had been seriously damaged by persons from Weymouth, and that fish had been sent here from Canada which were of an impure and unhealthy quality.

Messrs. Charles Stanwood, S. W. Hathaway, S. W. Hovey, and J. H. C. Campbell were appointed a committee to look after the interests of the trout fisheries, it having been reported that some of our fish markets were offering for sale speckled trout which were unfit to eat, and should not have been taken.

After the election of several new members, the meeting went into executive session, which would probably result to the sorrow of the violators of the provisions of the smelt law, which reads:—"Whoever takes any smelts with a net of any kind, or in any other manner than by naturally or artificially baited hooks and hand lines, shall forfeit for each smelt so taken the sum of twenty-five cents," excepting being provided for in the act in case these fish happen to be caught in instances when seining for herring, alewives, &c., is lawfully allowed.

THE AMERICAN FISH CULTURISTS ASSOCIATION.—The Third Annual Meeting of this Association will be held in New York, on Tuesday, February 10th, 1874, at the office of Mr. George Shepard Page, No. 10 Warren street.

Hon. Spencer F. Baird, U. S. Commissioner of Fisheries, has been invited to read a paper on his recent examination into the condition of the Coast Fisheries of New England; Charles G. Atkins, Esq., of Bucksport, Maine, special commissioner for the associated States, to read a paper on the collection of salmon ova and salmon hatching at Bucksport; Rev. Livingston Stone, of Charlestown, N. H., a paper on his recent experiments in the collection of salmon ova in California and the food fishes of the Pacific coast; Seth Green, of Rochester, N. Y., Fish Commissioner for the State of New York, on his recent experiments in the collection of the ova and hatching of the useful fishes; E. A. Brackett, Fish Commissioner for the State of Massachusetts, on fishways and to give an account of the fishway recently erected on the Connecticut river, at Holyoke, Mass.; Chan Laisun, of Springfield, Mass, commissioner on education from the Chinese government to the United States, to read a paper on fish culture in China; Rev. William Clift, president of the Association, a paper on the "transmission of qualities in species," as related to fish. Hon. Horatio Seymour, Fish Commissioner for the State of New York; R. J. Pike, Fish Commissioner for the State of Connecticut; J. H. Slack, Fish Commissioner for the State of New Jersey, and James Worrall, Fish Commissioner for the State of Pennsylvania, have been invited to read papers on subjects of their own choosing. The reading of papers will be followed by a discussion of topics relating to Fish Culture. A full attendance of members is desired, and all others interested in the object of the meeting are cordially invited to attend. We shall print special reports and abstracts of the papers read.

CHARLESTOWN, N. H., Jan. 6, 1874.

EDITOR FOREST AND STREAM:—

I beg permission to enclose the accompanying letter to you for publication in your journal.

LIVINGSTON STONE.

CHARLESTOWN, N. H., Jan. 6th, 1874.

HON. SPENCER F. BAIRD.

DEAR SIR.—The California salmon in my possession to the number of 35,000 were shipped from here by the 7 P. M. train on Friday, December 26th, 1873, in charge of Mr. Myron Green. I am now in receipt of a letter from Mr. Green saying that he arrived at Swanton, Vermont, the next morning at eight o'clock with the salmon in first-rate order. He then took the fish up the river in a wagon and placed them as follows:—The first lot was placed in the Missisquoi River, two miles above Swanton, where there was a coarse, gravelly bottom, with plenty of large boulders, the current running about two miles an hour. The second lot was placed in the Kelly Brook, which empties into the Missisquoi, two and a half miles from Highgate. The third lot was deposited in the main river near Highgate. The fourth lot was put into Hunkeford Brook, about a mile and a half from its mouth, above a cascade, which cuts off the ascent of pike and pickerel. This brook enters the Missisquoi River near Highgate.

The young salmon received were very lively and quite at home when placed in the water. The temperature of the river was about 38° F. Mr. Green writes that a good deal of interest was manifested in this movement of the salmon by people on the route, and I judge from his report that the expenditure was an entire success.

Yours, very truly,

LIVINGSTON STONE.

OSWEGO, January 5th, 1874.

EDITOR FOREST AND STREAM:—

In your paper of January 1st, "Fern Fly" takes exception to the proposed stocking of the Oswego River with salmon by Seth Green, and adds, "It is a dull, muddy stream, as little like a salmon river as a Jersey creek." Of course, "Fern Fly" writes at random, either knowing or caring not for the truthfulness of his statement.

If you will look upon the map of our State you will see that the Oswego is the outlet of the waters of Canandaigua, Crooked, Cayuga, Seneca, Owasco, Skanateles, and Oneida lakes, nearly all of the purest water, and were, until the Oswego was dammed for canal purposes, over forty years since, with their tributaries, the resort of shoals of the lordly salmon. With the clearing up of the forests about these lakes, in the mean time, these waters have become clearer, and are now more fit than then for the habitation of that fastidious fish, that loves not "dull, muddy streams." It is not for the fish that I take up the cudgel, as angling with fly or bait for salmon so far run from salt water would be out of the question, but I would not have the clear, rapid waters of our river doubly damned to no purpose by a random shot.

The Oswego River falls one hundred and twenty feet in its course within twenty-four miles of its mouth, and is finely stocked with black bass, and its rapids furnish fine fly fishing for that gamesome fish all through the summer months. The black bass of which I write are the black bass of the great north lakes—the *Grystes nigricans*, as classified by Agassiz—and are a very different fish from the so-called black bass of the St. Johns River, which your Florida correspondents write of.

The bass of the St. Johns River are the *Grystes megastomus*, as described in his book on fish culture and fishing by Dr. Theodatus Garlick, of Cleveland, Ohio, one of the truest and worthiest disciples of Isaac Walton. I, too, have cast my lines in the St. Johns and taken these fish, and

heard them called trout by the natives. They exceed double the size of the black bass, the head is much larger in proportion, and the mouth is enormous. This fish is found in many of the small lakes and ponds of the northern States, and it is no impediment to his thrift that the waters are warm and muddy, and his flavor, of course, is marred by his bad habits.

To return for a moment to the river stocking question. "Fern Fly" asks, "Would not the Oswegatchie make a noble salmon river?" If "Fern Fly" would visit that river he would find it, from Gouverneur to the St. Lawrence, a black, dirty stream, its banks studded with tanneries and saw mills, and its waters fully stocked with pickerel and yellow pike.

J. E. L.

ST. LAWRENCE SALMON FISHING.

JERSEY CITY, January 9th, 1874.

EDITOR FOREST AND STREAM:—

DEAR SIR.—Enclosed please find the score of the fishing at river Godbout during the years 1865, 1866, 1867, 1868, 1869, 1870, and 1871.

You will notice that the largest "catch" was made by Mr. Allan Gilmour in 1865, July 5th and July 10th, and I believe that this is the largest score ever made in the same number of hours. His heaviest day was July 10th, when he took 46 salmon weighing 426 pounds. He was at the pool a little after 6 o'clock in the morning and left a little after 7 o'clock in the evening. He told me he rested about an hour at noon for his lunch. This would make about twelve hours of fishing and give an average of a salmon every fifteen minutes. Mr. G. is a splendid fisherman, and is one of the few salmon fishermen that I have met that I thought could perform the work and endure the physical strain of killing such a great number of fish. The Godbout is one of the finest rivers on the "north shore," and for scenery is just all you could imagine on a magnificent salmon river.

Wishing that every reader of your paper may enjoy it as much as I do, I am yours respectfully,

T. B. MILES.

We print a recapitulation of these scores; sorry we haven't space to print them in detail. We cannot question the accuracy of this statement, this catching of a salmon every fifteen minutes for twelve consecutive hours. Indeed, we have seen time averages just as extraordinary vouched for. But accepting the fact, we must deferentially acknowledge our own experience at fault and ourself willing to take odds against all comers.

Statement of Fishing on the River Godbout, Lower St. Lawrence, for Seven years.

1865—June and July, 24 days, four rods.

Rod 1.	Capt. Noble.	49 fish.	weight 488 lbs.
Rod 2.	Mr. Cross.	109 "	" 1059 lbs.
Rod 3.	A. Gilmour.	165 "	" 1567 lbs.
Rod 4.	James Law.	155 "	" 1551 lbs.
		478	4665

Average weight of fish over 9½ lbs.

1867—June and July, 33 days, four rods.

Rod 1.	A. Gilmour, Jr.	50 fish.	weight 517 lbs.
Rod 2.	A. Gilmour.	165 "	" 1778 lbs.
Rod 3.	James Law.	123 "	" 1728 lbs.
Rod 4.	Rev. Dr. Adamson.	89 "	" 1069 lbs.
		427	4669

Average weight of fish 11 lbs.

In addition to the above were caught a number of kelt, and about 500 grilse.

1868—June and July, 18 days, three rods.

Rod 1.	A. Gilmour.	113 fish.	weight 1297 lbs.
Rod 2.	A. Cross.	93 "	" 1084 lbs.
Rod 3.	W. M. Ramsay.	67 "	" 735 lbs.
		273	3116

Average weight of fish 11½ lbs.

1869—June and July, 31 days, four rods.

Rod 1.	A. Gilmour.	139 fish.	weight 1467 lbs.
Rod 2.	John Gilmour.	164 "	" 1806 lbs.
Rod 3.	John Gilmour, Jr.	125 "	" 1338 lbs.
Rod 4.	D. L.	87 "	" 882 lbs.
		515	5493

In addition to the above, about 35 Kelts (an unusual number) were caught during the first few days fishing—most of which (and when circumstances permitted) were returned to the water. Also, about 250 Sea Trout were taken while fishing for Salmon, of an average weight of 2½ to 3 lbs; and 7 Grilse.

In consequence of frequent and unusual heavy rains, the river, during the whole time, continued too high for good fishing, and in consequence a number of the best pools were so flooded as to prevent the fish from lying therein, or at least taking the fly as freely as in former seasons.

1870—June and July, 29 days, four rods.

Rod 1.	Dr. Campbell.	111 fish.	weight 1214 lbs.
Rod 2.	Alex Urquart.	81 "	" 894 lbs.
Rod 3.	A. Gilmour.	106 "	" 1140 lbs.
Rod 4.	D. Law.	101 "	" 1100 lbs.
		399	4343

Average about 11 lbs.

On arriving at the river it was found to be unusually low and in consequence there was no fishing in the lower pools, which in ordinary seasons give the best sport at the beginning. During the whole time of fishing only a few light showers fell, so that the water continued to fall steadily, and by the middle of July it had become lower than ever before known to those now acquainted with the river. No kelt were caught this season.

1871—June and July, 30 days, five rods.

Rod 1.	A. Gilmour.	102 fish.	weight 1165 lbs.
Rod 2.	D. Law.	140 "	" 1602 lbs.
Rod 3.	A. Cross.	54 "	" 620 lbs.
Rod 4.	D. Gilmour.	120 "	" 1338 lbs.
Rod 5.	A. T. Paterson.	93 "	" 996 lbs.
		509	5721

Average weight of fish 11½ lbs.

Water very high all the time of fishing.

Now, if we investigate carefully, we find that these fish were taken in two principal pools; that the pools afforded ample sweep of rod and play of line; that the fish on the year in question, when the largest average was made, (1865,) were small and easily handled; and that very few strikes got into quick water. This will justify the statement and make the feat practicable. We are very nice on these points; we don't theorize, or conjecture, but always give

reasons for our opinions, and facts for assertions. The Godbout is a large river flowing with full volume, broken by rapids, and affording two magnificent pools a considerable distance above its mouth, and other minor pools which are but little threshed.

Singular about those Kelts in June. Kelts, every angler ought to know, though few do, are spent fish—fish that have spawned, and ought, by good rights, to make a straight wake at once down stream to salt water, to find food, and recuperate after the fulfilment of nature's demands. What business had these salmon to spawn in June when the usual season is in August and September? We must observe, too, in this connection, that no Kelts have been taken since the thorough enforcement of the fishery laws of 1868. Now, did these salmon learn to anticipate the raids of netters and dippers by a month or two and so make their precious deposits before the fishing season commenced? We are perfectly aware, and do not need to be reminded, that runs of salmon of the same outcome and generation do not occur always at the same day or month, and that these Kelts may have been in advance of their sisters. But this argument holds no water against the fact of the non-appearance of early Kelt during the past four years. There are perhaps twenty experienced salmon-anglers in the United States and Canada, thoroughly informed but seldom heard from in print, who will condescend to throw some light on this problem.

We wish all our readers, especially those in Great Britain, of whom we have some scores, to bear in mind that the St. Lawrence (Province of Quebec) fishing is at least three months later than the fishing in western Nova Scotia. In the locality last named, the salmon begin to run in February, or as soon as the ice breaks up, and fly fishing in March with the line frozen so stiff that it will scarcely render, is not unusual, or the result by any means insignificant. July Kelts in these rivers are not a wonderful phenomenon.

—*La Chasse Illustrée* states that in a pond near the Castle of Arras a gardener caught a carp having just behind the fins two rings of gold, joined together, and on them was inscribed "Isaure de Berville, 1704." This case of age of the carp seems well authenticated.

Yachting and Boating.

All communications from Secretaries and friends should be mailed not later than Monday in each week.

HIGH WATER. FOR THE WEEK.

—The New York Yacht Club will hold its annual meeting at the Club House, corner of Madison avenue and 27th Street, on February 5th, for the election of officers for the ensuing year. The report of the Committee on the Classification of Yachts will be read at this meeting.

—The Brooklyn Yacht Club will hold its annual meeting on Wednesday the 28th, at their Club Rooms, Court street, Brooklyn. The Secretary, Mr. William F. Lee, has received from the owners of the following yachts, now building at Rye, N. Y., the dimensions of the yachts that will be added to the fleet of the Club:—Sloop, owned by Mr. Daniel Edgar, Jr., of New Rochelle—length over all, 67 feet; length on water line, 61 feet 6 inches; depth of hold, 6 feet 6 inches; tonnage, 82 tons. Sloop, owned by Mr. William Edgar Morris, of New Rochelle—length on deck, 47 feet; length on water line, 43 feet; breadth of beam, 15 feet; tonnage, 31 tons.

—The Seawanhaka Yacht Club at a recent meeting elected the following officers for the ensuing year:—Commodore, William L. Swan; Vice Commodore, James W. Beckman, Jr.; Secretary, Frederic D. P. Foster; Treasurer, B. L. Swan; Measurer, F. G. Foster; Chaplain, Rev. William Irvin; Surgeon, James R. Wood. The annexed yachts were added to the fleet of the Club:—Schooners Ariel, Commodore William L. Swan; Idler, J. S. Colgate; Peerless, J. R. Maxwell; Triton, G. A. Thayer. Cabin sloops—Alert, Henry Vail; Christine, S. P. Blagden; Au Revoir, J. E. Rosevelt. Open sloops—Cruiser, C. Lee; Ripple, C. M. Schefflein; Electra, W. B. Simmonds.

—The annual Convention of the "Rowing Association of American Colleges" will hold its annual session at Hartford, Conn., on Wednesday, January 21st. The great interest taken by all parties in College Aquatics, is shown by the addition of three more entries, Princeton, Rutgers and the Chicago University, making in all sixteen representative college boating men to decide the all-important question, "On what water shall we hold the next College Regatta?" Taking every matter into consideration, and the strong and influential inducements held out by the Saratoga Rowing Association, (which were conscientiously carried out last year), such as transporting boats and crews from the railroad depot to the Lake, a standard price for carriage hire and board, building a grand stand, with free admission for the friends of the students, also boat houses for the crews; in fact the willingness on the part of the Saratoga Association to carry out any suggestions for the safety, comfort and success of the next Great College Regatta, we therefore hope that the Rowing Association of American Colleges will decide on Wednesday next, that the ensuing College Regatta will take place on that beautiful and admirably well adapted water for rowing contests, the Lake of Saratoga.

PHILADELPHIA BOAT CLUBS.

PHILADELPHIA, Jan. 12, 1874.

EDITOR FOREST AND STREAM:—

The representative of the FOREST AND STREAM was very courteously received by W. R. Tucker, Vice Commodore of the Schuylkill navy, and escorted through the different boat houses, and kindly invited to take a row in one of their many beautiful pleasure barges. This unexpected kindness was immediately acted upon. The water was smooth as a mill pond, the day (January 8) being unusually mild, and the row was a most pleasant one.

The Schuylkill Navy held their annual meeting January 5th, on which occasion the following gentlemen were elected as officers for the present year:

Commodore, James M. Ferguson, Quaker City Club.
Vice Commodore, John Hockly, Jr., Undine Club.
Secretary and Treasurer, Jonathan Gillingham, No. 10 Walnut st., Undine Club.

Official Log Keeper, W. R. Tucker, Undine Club.
The Schuylkill Navy is composed to-day of the following clubs:

Undine, 80 members, 14 boats.
University, 128 members, 8 boats.
Crescent, 66 members, 13 boats.
Philadelphia, 53 members, 8 boats.
West Philadelphia, 88 members, 12 boats.
Pennsylvania, 38 members, 9 boats.
Malta, 55 members, 6 boats.
Quaker City, 42 members, 9 boats.
Making in all, on the 1st of July, 1873, the handsome aggregate of 550 members, with a fleet of 79 boats. Of this navy 44 are shells, 27 gigs, and 8 barges. Outside of the navy are the following clubs:

The Bachelor Club, the oldest club in Philadelphia, organized in 1853, with 53 members and 8 boats.

Vesper, 57 members, 10 boats.
Pacific, 21 members, 3 boats.
College, 27 members, 3 boats.

Making in all 150 members and 24 boats, or a grand total in Philadelphia of 709 members and 103 boats.

All these clubs have their boat houses, with the exception of the West Philadelphia, situated at the foot of Lemon Hill in Fairmount Park, and their elegance and tasteful style of construction add no little to the beauty of the spot. These boat houses cost about \$10,000 each on an average, are built of stone in a most substantial manner, and are generally occupied by two clubs; the exceptions are the Undine and Bachelor Clubs, who each own their own houses. The interior construction of these boat houses is on a par with their outside elegance, every arrangement being found in them for the accommodation of the members. They have bathing houses attached to them, reception and withdrawing rooms, the boats being housed in the lower part of the building, with floats in front for launching and taking in the boats.

The course from the boat houses to the Falls of the Schuylkill river is three and a half miles. From the peculiarity of the river, the water is seldom lumpy and rarely is ever unfit for boating exercise. Most of the course, or a great deal of it, being within the Park property, exercise in shells or in the boats can be taken without fear of interruption. There is a very slight current always running down caused by the falls, but its influence on the river and on the time of the boats is quite insignificant.

The racing season of 1873 opened with the regatta of the Quaker City Club on May 10th. The next race was between the eight-oared shells of the Crescent Club and the six-oared shells of the Bachelors, won by the Crescents; distance, 2½ miles; time, 16:30. The spring regatta of the navy was held June 14th. The single shell race being a foul, was ordered to be rowed over again. The four-oared shell race was won by the Vesper Club, who pulled by invitation in the regatta. Distance, 3 miles; time 19:24 minutes. The six oared barge race was won by the Pennsylvania Club. 3 miles, time, 21:15 minutes. Four-oared gig race was won by Pennsylvania; 3 miles; time 20:4½. All these races were timing races; average time for winning boats during the regatta: four-oared shell, 6:28; four-oared gigs, 6:41½; six-oared barges, 7:05; single shells, 7:36. The single shell race which had been ordered to be pulled over was won by John Lavens, of the Pennsylvania Club; time 22:25. distance, 3 miles.

On August 9th a single shell race between four competitors was won by Jas. B. Mingus of the Vesper; time, 17:30; distance, 2 miles and 1,400 feet. Six oared race took place August 30, between three six-oared barges; won by the Pennsylvania Club; time, 18:25; distance, 2 miles and 2,800 feet. On September 13 the Navy held their full review. Fifteen boats appeared on the course. Oct. 25th between double scull gig of College Club, and a pair oar shell of the University; won by the former; distance, 1½ miles, straight away; time, 9:20. On Monday, 27, the Club boats of the Malta; also the Crescent Club regatta on the same day.

The following interesting statistics of the Undine Club for the year 1873 will astonish some of our readers: They rowed 695 times; 3,665 miles; greatest number of miles were rowed by J. Gillingham, being 1,083 miles. The club rowed on 212 days in the year. On account of want of a crew or bad weather, the club did not row on 39 days; the rowing was closed by ice 62 days; and on Sundays when the club do not row, making it 52 days, comprises the extent of the year's work.

SOUTH BOSTON YACHT CLUB.—A regular meeting of this Club was held at their Club House at City Point, South Boston, Wednesday evening, the 7th instant, at which the

following named officers were elected for the ensuing year:—Commodore, J. N. Roberts; Vice Commodore, H. J. McKee; Fleet Captain, J. A. Woodward; Measurer, J. Winniatt; Recording Secretary, E. Hatch, Jr.; Financial Secretary, John Monks; Treasurer, Thomas Christian; Trustees, G. G. Morris, W. H. Lafield, J. Stewart. The meeting, which was very large and enthusiastic, adopted a series of resolutions, to be sent to the family of the late A. P. Holbrook, a deceased member, and a vote of thanks was tendered to the retiring Commodore, F. S. Wright, and his associate officers. Before vacating his chair, Commodore Wright made a few appropriate remarks, concluding by inviting the members to partake of one of his superior chowders. Songs and stories wound up the pleasures of the evening. The Club is in a very thriving and healthy condition. Over twenty new yachts have been added to the list. They propose to celebrate their sixth anniversary at the next meeting, which takes place February 6th. Capt. Roberts, the new Commodore, is well known among yachtsmen, and it is believed, will make an efficient and popular officer.

—GEORGE BROWN'S CHALLENGE.—This challenge was received too late for our last issue:

HALIFAX, N. S., Jan. 5, 1874.

The challenge of John Biglin, of New York, telegraphed here to-day, I accept, and row at Springfield, Mass., in June; or I will row any oarsmen in America a five mile race, with turn, in best-and-best boats, for any sum not less than \$2,000, on either the Charles river, Springfield, or the Kennebecasis. This challenge to remain open for one month from this date, and the race to take place sometime during the month of June, 1874. Any party accepting this challenge will please deposit the sum of \$500 with either W. L. Lowell & Co., Exchange Broker, Halifax, N. S., or Judge Jackson, American Consul at this place, which will be immediately covered. Each party to pay his own expenses. Yours, respectfully,
GEORGE BROWN.

—An ice-floe would not be ordinarily chosen for lake navigation in preference to a sail-boat, but a recent occurrence near East Saginaw shows that it may be very much safer. Two young men who went out fishing the last day of the year were carried away on an ice-cake, and after several days' absence, were given up as lost. A party of six men started out last Monday in search of them. On Tuesday, the two lost fishermen came to shore, worn out with six days' fasting and suffering, but alive. On Wednesday the boat in which their would-be rescuers had departed was found bottom-up near the shore, and there is no doubt that the six men have been drowned.—*Chicago Tribune*, 8th.

Shot Gun and Rifle.

GAME IN SEASON FOR JANUARY.

Moose, *Alces Malchis*. Caribou, *Tarandus Rangifer*.
Elk or Wapiti, *Cervus Canadensis*. Squirrels, Red Black and Gray.
Rabbits, common Brown and Grey. All kinds of Wild Fowl.

FOR FLORIDA.

Red Deer, *Caracus Virginianus*. Wild Turkey, *Meleagris gallopavo*.
Woodcock, *Philohela minor*. Quail, *Ortyx Virginianus*.
Snipe, Plover, Curlew, etc., in great variety.

[Under the head of "Game, and Fish in Season" we can only specify in general terms the several varieties, because the laws of States vary so much that were we to attempt to particularize we could do no less than publish those entire sections that relate to the kinds of game in question. This would require a great amount of our space. In designating game we are guided by the laws of nature, upon which all legislation is founded, and our readers would do well to provide themselves with the laws of their respective States for constant reference. Otherwise, our attempts to assist them will only create confusion.]

—On Tuesday evening last, the 13th of January, the annual meeting of the New York Association for the Preservation of Game was held at the residence of B. L. Swan, Jr., Esq., Royal Phelps presiding. The meeting was a full one, and of the most satisfactory character, and the society may with just pride point to the great advance made, through their instrumentality, in regard to the preservation of game, not only in New York, but throughout the whole country. The Committee on the revision of the game laws, reported in favor of petitioning the Legislature to restore that portion of the law of 1871, prohibiting the killing of deer on Long Island for the next five years, which important measure has been frequently advocated in the columns of the FOREST AND STREAM. Recorder Hackett urged strongly the importance of this measure, and the report of the Committee was unanimously approved. The account of the Treasurer showed the funds of the Association, notwithstanding it has been plaintiff in many cases, to be in good condition, there being some \$2,800 on hand. Mr. A. C. Post was elected a member of the Association. Mr. Haggerty spoke very much to the point when calling the attention of the Association to the choking up of the streams in the Adirondaek region by felling timber, and the ruthless waste going on there. The counsel of the club, C. E. Whitehead, Esq., reported the progress made in different suits brought by the Association. The following gentlemen were elected as officers for the ensuing year: President, Royal Phelps; Vice President, R. B. Roosevelt; Secretary and Treasurer, W. J. Hays; Counsel, Charles E. Whitehead, Executive Committee, Dr. J. H. Gautier, Clinton Gilbert and D. H. Haight.

—There are a great many right and left snap shots and capital statuettes on a runway who don't know much more of the haunts and habits of their game than they do of crochet work or knitting. They have an intelligent bush-beater who knows the lay of the coveys, a dog with a good nose and well broken, a splendid pair of barrels, and a keen eye and quick trigger. The guide leads up to the hunting ground, then the dog takes the van and attends to business, and when his tail gets stiff a bird rises, the gun drops him neatly, the attendant marks him down, the dog retrieves, and the gunner puts him exultingly to bag. Precisely the

same on a runway. The guide who has previously tracked the deer or knows his habitat, puts out the hound, which runs the deer to water, or to cover by secluded or well known by-paths, and the sure aim of the practiced marksman brings the game to grass. Now, so far as the requirements of this sportsman go, all is well; but his education is anything but complete. He has actually begun at the finishing school instead of the rudiments. Perhaps these sharp shooters will consent to a few words of instruction from a gentleman who knew Bob White when he was a boy—we mean when the gentleman was a boy. "Bob White" is the vernacular for quail, you know:

In fair weather, his favorite feeding ground is on the wheat stubble, especially if it be grown up with "rag weeds," and generally not far from a brook or slough, if there be one in the field. During the middle of the day quail will be found along the fences of the stubble fields, if there be blackberry or other bushes for cover; also on newly cleared land that has never been cultivated. In rainy weather they take to the bushes and remain there all day, and if possible elude pursuit by running. Frequently the sportsman has to follow a covey for a quarter of a mile before he can get near enough to flush them. Also, in snowy weather they go to the timber, but in a day or two after the storm come back to the fields again. After there has been sunshine sufficient to melt the snow from the northern banks of the brooks, if the weather turn cold and clear, every covey that rises in that vicinity will be found sunning themselves on the banks which are bare of snow. We recently found four large coveys within as many hundred yards along a small brook, when on ordinary occasions that would be considered a good half day's find. When a covey has been flushed and gone down, if there be thick weeds or grass they will hide at once and are easily found by the dog. If they come down near piles of brush they are almost sure to run into them, but a kick or two will generally get them out. If they fly to thick bushes they will probably run together, and get away as fast as they can run, and it is a singular fact that a dog which had no difficulty in trailing them before they were put up will be totally unable to do it now, and so it is useless to follow them unless there is snow, and even then it is doubtful if you get a shot, for they will travel faster through the brush than you can follow. Possibly it is generally known to sportsmen that quails will double under such circumstances like a hare, but this trait has been noted repeatedly. We have also noticed that a dog can smell but very little when the weather is cold and the ground covered with fine dry snow. In fact a dog is at a disadvantage, if not thoroughly broke. If a covey be flushed, and on coming down one of them gives a call or two, you may look for them to fly again almost immediately. They occasionally do this when they happen to come down where the cover does not suit them. In the early part of the season one can frequently learn where the scattered ones are by imitating their call, which every one can do with a little practice. Later in the season this will not succeed till near sundown. In Florida the quail are more frequently found in gardens or clearings along the borders of palmetto scrub. If the garden or field be fenced, let the dog and one gunner take the field, and another gunner work the outside taking the birds as they fly over into the scrub. Once in this cover they are safe, for neither dog, man, nor double-plated packydermata can follow them.

—The annual meeting of the National Rifle Association was held on Tuesday evening last, the 13th January, at the First Division Rendezvous, West Thirteenth street. An abstract of the report of the Secretary will be found in our columns. As we are going to press, it is too late to give details of election, which we will publish in our next number.

—Our attentive Philadelphia correspondent, "Homo," mentions among the "signs of the times," and as an illustration of our remarkably open and mild winter, that Leonard Wren killed an English snipe on the Repoplar meadows on Christmas day—a large, strong bird. Dick Wood and George Morris, two of our Delaware River pushers, put up two rail while hunting for snappers last week on Tinnicum Island. Suckers are running up the Schuylkill, and the net fishermen are "scooping them" at Fairmount Dam. Jessamines are in blossom in West Philadelphia, and there is no end of wonders. I heard from one of the Philadelphia Sportsman's Club that a friend of his had gone to our "neck" meadows to pick up a few snipe, and really expected to find them.

—An Iowa correspondent tells of a remarkable feat in quail shooting one Sunday morning, when a Mr. H. Armfield, of Redfield, Iowa, observed four pinnated grouse come down in a grass plot in front of his house. Taking his gun he put them up, killing two with his first and one with the second barrel; the fourth flew directly over his head and was killed by a blow from his gun. The affair was witnessed by more than twenty people who were on their way to church.

—The prospect for game in Iowa next year is remarkably good, there being an abundance of grouse and quail at the close of the season, and a very mild winter so far. "Chicken" shooting does not commence in that State till the first of September hereafter.

CONLIN'S RIFLE AND PISTOL TOURNAMENT.—The entries for the different prizes at Conlin's rifle gallery exceeded by far the expectation of the proprietor. The novelty is the attraction in the shooting. It consists in firing at a bullet three-quarters of an inch in diameter, suspended from the ceiling by a string. A member of Mr. Conlin's gallery hit

the bullet seven times in succession, and then was politely asked to drop the bullet by cutting the string with his rifle ball. He stood rifle in hand, and at the word "one" cut the string, the bullet falling on the ground. This is no trick, but simply good nerve, accurate aim, and steady eye. We shall publish a list of winners, with the marks of accuracy.

—The New Jersey Sportsmen's Club held a grand pigeon shoot on their grounds, Sea View Track, at New Dorp, S. I., on January 12th. The wind was very unfavorable for making great scores. The birds were the best of the kind ever sprung from a trap. The members and friends of the Association turned out in goodly numbers, and the sports passed off pleasantly, notwithstanding that a gale of wind prevailed nearly all the afternoon. All matches to be governed by the New Jersey Shooting Club rules. The first match was for the Diamond Badge at 25 single birds, 21 yards rise, 80 yards boundary, 1½ oz. of shot, between the present holders G. Watson and W. A. Dunlap.

DIAMOND BADGE MATCH.		
	In succession.	Killed.
W. A. Dunlap.....	5	14
G. Watson.....	6	14

TIES AT 26 YARDS, 5 BIRDS EACH.		
	In succession.	Killed.
W. A. Dunlap.....	2	4
G. Watson.....	2	2

The second match was for a Handicap silver cup, 5 birds each, 1½ oz. shot, same conditions.

	In succession.	Killed.
J. Tyson.....23 yards.....	3	4
E. H. Shorb.....23 yards.....	3	3
W. Hughes.....23 yards.....	2	3
C. Townsend.....24 yards.....	2	2
D. Kelley.....23 yards.....	0	2
G. H. Wild.....23 yards.....	0	1

The third match was a Sweepstakes at 5 birds each, 2½ entrance, same conditions.

	In succession.	Killed.
W. Dunlap.....	5	5
G. Wild.....	3	4
C. Townsend.....	2	4
D. Kelley.....	4	4
J. Tyson.....	2	4
H. Warren.....	2	3
E. H. Shorb.....	2	2
J. P. Felker.....	2	2
W. McFall.....	0	2
J. S. Conover.....	0	2
W. Hughes.....	2	2

TIES AT THREE BIRDS EACH.		
	In succession.	Killed.
C. Townsend.....	3	3
J. Tyson.....	3	3
D. Kelley.....	2	2
G. Wild.....	0	1
A. Hughes.....	0	1

C. Townsend and J. Tyson divided the sweepstakes.

The fourth match was a Sweepstakes, 3 birds each, 2½ entrance, same conditions.

	In succession.	Killed.
J. P. Felker.....	3	3
W. Hughes.....	2	2
G. Wild.....	0	1
E. H. Shorb.....	0	1

Messrs. J. P. Felker and D. Blake acted as referees during the matches. We take pleasure in complimenting the New Jersey Sportsmen's Club for the fair and creditable manner in which the sports were conducted.

WASHINGTON, D. C., Jan. 9, 1874.

EDITOR FOREST AND STREAM:—

DEAR SIR:—I send you by to-day's mail the result of the tie between Derrick and Mills at the match on December 29, 1873, and a statement of another match for a Remington gun which took place yesterday. Derrick and Mills shot at ten birds at twenty-five yards rise and tied again, each killing seven; they then shot at five birds at thirty yards rise, Derrick killing four to Mills' three.

In the match yesterday Mayhew and Locraft tied and shot off at four birds. Locraft killed his first two, missed his third, and the cap snapped on the gun at the fourth, making another tie, Mayhew having killed his two last birds. There being no more birds on the ground, the tie will be shot off at some future day.

Col. C. M. Alexander was referee, and C. S. Wheeler and T. Taylor Page were judges. F. O'Brien attended to the loading.

The average of the shooters in this match shows no improvement since the previous one. Another match is being made up.

The following are the scores:

Locraft—1 1 1 1 1 0 1 0 1 1—8.
Rives—0 0 0 0 0 1 0 1 0 1—3.
Benjamin—0 1 1 1 0 1 1 1 1 0—7.
Mayhew—1 1 1 0 1 1 1 1 1 0—8.
Barker—0 0 0 1 1 1 1 0 0 1—5.
Wandel—0 1 1 0 1 1 0 1 1 1—7.
Williams—1 1 1 1 0 0 1 1 1 0—7.
Derrick—0 1 1 1 1 0 0 1 1 0—6.
Jones—1 0 0 1 1 0 1 0 0 1—5.
Gittings—0 1 1 0 1 1 1 0 0 1—6.
O'Neal—0 0 1 0 1 0 0 0 0 1—3.
Ferguson—1 1 0 0 1 0 1 1 0 0—5.

TIES.

Locraft—1 1 0 0—2
Mayhew—0 0 1 1—2.
25 yards:
Derrick—1 1 1 0 1 1 1 0 1 0—7.
Mills—1 1 0 1 1 1 1 1 0 0—7.
30 yards:
Derrick—1 0 1 1 1—4.
Mills—0 0 1 1 1—3.

J. N. D.

Here are some of the scores made by the Irish teams We select only the best:

At 800 yards.....Private Young.....	3 4 4 4 3 4 4 4 3 4 3 4—55
.....Private Millner.....	3 4 4 3 4 4 3 3 4 4 3 4 3 3—54
At 900 yards.....Private Wilson.....	3 2 4 4 4 4 4 2 4 4 4 4 4—53

The highest aggregate was made by Young with 156, as follows: At 800 yards, 55; at 900 yards, 49; at 1,000 yards, 52.

PORTLAND, ME., Jan. 9, 1874.

EDITOR FOREST AND STREAM:—

The annual meeting of the Forest City Shooting Club was held Thursday, January 8, and the following officers elected for the ensuing year: President, Jonas Hamilton; vice president, Lewis Thompson, Jr.; secretary, Frank W. Smith; treasurer, Frank Merrill; executive officer, Roscoe G. Hall.

The secretary's report shows a membership of fifty-six, seventeen having joined during the year. The sporting record has been very good this year, a larger than usual amount of game having been reported bagged, while in trap shooting the scores are very fair, when it is taken into account that of the three recorded club matches one was held in a driving rain storm, and another in an equally bad snow storm. A synopsis of the scores was presented as follows:

Whole number of birds trapped, 685.

Whole number killed at score, 414.

Whole number not scored, 217.

	Hit.	Miss.
Best score was Nov. 29th.....	160 to	86
Poorest score was made Nov. 18th.....	134 to	114
Best average at single shoots.....	6 to	0
Best average at double shoots.....	27 to	7
Best average at three shoots.....	35 to	7
Poorest average at one shoot.....	1 to	5
Poorest average at two shoots.....	9 to	11
Poorest average at three shoots.....	19 to	26

At gyro shooting, (one match,) the score was 110 hits, 42 misses; best score, 8 hits, 0 misses; poorest score, 3 hits, 5 misses.

Scattered as the members of the club are through different sections of Maine and New Hampshire, they have a large tract of country over which to obtain specimens of the different birds and beasts most sought after by the sportsman, and it is the purpose of the club to form a collection of such a description, at which, in fact, a small beginning has already been made. One of the great objects of the club is, of course, the preservation of game, and in our contest with the active hostility of the so-called "pot hunters" on the one hand, and the utter indifference of a majority of our citizens on the other, we look for much aid and moral support from our brother sportsmen in other States, who must, from our position among the breeding places of the wood duck, snipe, and woodcock, reap the greatest benefits from our success, and suffer in loss of game should we fail to break up the traffic in unseasonable flight birds, our State laws being almost a dead letter so far as any practical enforcement is concerned. S.

"VANITY FAIR TOBACCO."—We have received from Messrs. Kimball & Co., of Rochester, New York, very choice specimens of smoking and chewing tobacco, including the celebrated brands styled, "Peerless" and "Vanity Fair." We can appreciate the value of a "good smoke" as well as anybody, and in camp, afield, or in cosy quarters at home, the beneficent pipe whose heart is aglow is to us ever a solace and joy. As for the chewing tobacco, the chewers must speak for themselves. We don't use it, but we have heard an old hunter say that it couldn't be surpassed—he would "rather have it than a good meal of vittles." On one occasion, out on the plains, we happened to come across a couple of Mexican "greasers," who had nothing to eat for a week, and were nearly famished. "Have something to eat—some bull beef and hard tack?" we asked in pitying sympathy of their condition. "No—no, tobacco—tobacco!" they cried, though scarcely able to stand from exhaustion, and with a mouthful of the weed they at once proceeded to appease their appetite. We ourselves have experienced the cravings that resulted from a tobacco famine in wilderness regions, and it is by this token that we are induced to waive our dislike for editorial puffing, and to declare that the packages sent us, especially of the Peerless, are the *ne plus ultra* of consolers for the true sportsman or any other man who uses the weed. The name selected by the company for their manufacture is a very happy one, and if they keep the quality up to the present standard the old candidates for popular favor will have to look to their laurels. The "Peerless" is meeting with the endorsement of connoisseurs abroad, as well as in this country, as will be seen by a card in our advertising columns.

One of our advertising patrons, quite unsolicited on our part, writes to us: "By all means I will continue the advertisement. It is due to you to say that the advertisement of my business in the FOREST AND STREAM has done me a great deal of good. I am receiving every day letters and selling and sending goods away, on that advertisement, to all parts of the United States."

A curious page is added to anthropology by Lieutenant Colonel Marshall's book on the Tudas, a pastoral hill tribe of southern India. It seems that Tuda society is simply held together by the strength of family affection. Colonel Marshall states that the Tudas "are a quiet, undemonstrative, but intensely domestic people—domestic in the wider sense of viewing the entire family, to the last cousin, much as one household, in which every one is everywhere entirely at home; each one assists in the easy progressive task of emptying his neighbor's larder; no one exerting himself by one fraction to raise the family." This is indeed socialism of the most progressive character, and is well worthy of the attention of utopian philosophers. A sad portion of the history of this happy family is that children, being troublesome and disturbing elements in their domestic happiness, are generally put out of the way.

FOREST AND STREAM,

A WEEKLY JOURNAL.

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INDOOR RECREATION OF MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Co.

103 FULTON STREET, NEW YORK.

Terms, Five Dollars A Year, Strictly in Advance.

A discount of twenty per cent. for five copies and upwards. Any person sending us two subscriptions and Ten Dollars will receive a copy of Hallock's "Fishing Tourist," postage free.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices 50 cents per line. Advertisements in double column 25 per cent. extra. Where advertisements are inserted over one month, a discount of 10 per cent. will be made; over three months, 20 per cent.; over six months, 30 per cent.

The object of this journal will be to studiously promote a healthful interest in outdoor recreation, and to cultivate a refined taste for natural objects. We especially desire to make the FOREST AND STREAM the recognised medium of communication between amateurs and professional sportsmen. All of us have something to impart, which if made available to each other, will in time render us proficient in all those several branches of physical culture which are absolutely essential to our manhood and well-being, both as individual men and as a nation. A practical knowledge of natural history must of necessity underlie all attainments which combine to make a thorough sportsman. It is not sufficient that a man should be able to knock over his birds dexterously right and left, or cast an inimitable fly. He must learn by study and experience the haunts and habits of the game or fish he seeks. If he depend altogether upon his dog's nose, or upon his henchmen, he will some day have to retire from the field in mortification and disgrace. Therefore it is that we shall study to give practical instruction in the most attractive departments of natural history. We shall not forget the technicalities of the craft either, but take pleasure in designating the best localities for hunting and fishing, outfits, implements, remedies, routes, distances, breeds of dogs, &c. Each number will contain a paper descriptive of a particular animal, bird, or fish, with some instruction as to its habits, haunts and mode of capture, and the period when it is in season. We have arranged to receive regular weekly reports of the fishing and shooting in various parts of the country.

Yachting and boating will be encouraged, and yacht news be made an especial feature of the paper. A reasonable space will be given to athletic sports and those out-door games in which ladies can participate. In a word, every description of game that is in vogue among respectable people, and of value as a health-giving agent or recreative amusement, will be considered and its practice encouraged. Nothing that demoralizes or brutalizes, nothing that is regarded as "sport" by that low order of beings who, in their instincts are but a grade higher than the creatures they train to amuse them, will find favor in these columns.

To horse news we shall devote some space, giving a record of leading races and meetings and current events, but we shall not make it a feature of this journal. We leave this department to others, much more competent than ourselves, who are recognised throughout the country as exponents of the turf, and as authority in stock, pedigree and kind. We yield to no one, however, in our love and appreciation of the horse and his estimable qualities. The noblest of all animals, and the companion alike of men of high and low degree, he has never become contaminated by the moral atmosphere by which he is often surrounded, or degraded below the high rank to which his attributes entitle and assign him.

To the forest, lawn and garden we assign full place. For the preservation of our rapidly diminishing forests we shall continually do battle. Our great interests are in jeopardy—even our supply of drinking water is threatened, from the depletion of our timberlands by fire and axe. It is but proper to state here that the gentleman in charge of this department is the well-known "Olipod Quill," who was connected with the *Agriculturist* newspaper from the start, and a co-laborer with the lamented Downing for many years. Much valuable information will be found in this department.

Our military department is intended to comprise merely a weekly summary of news for officers and soldiers upon the frontier—such news as the castaways would enjoy to receive in a "letter from home;" and we trust that many of them will be inclined to send us in return some account of their hairbreadth experiences among the Indians, the buffaloes, the grizzlies and the antelopes. We of the East are not thoroughly familiar with the varied species of game in the far Northwest, and would like to receive full information especially of the numerous *Cervus* family and of the Rocky Mountain sheep. This department is under the charge of a distinguished army officer.

Our dramatic and art column will be prepared by Colonel T. B. Thorpe, and must at once become popular with all our readers who are interested in these matters. We shall occupy an independent position and throw our efforts in behalf of competent reform. We shall perhaps even clamor for it.

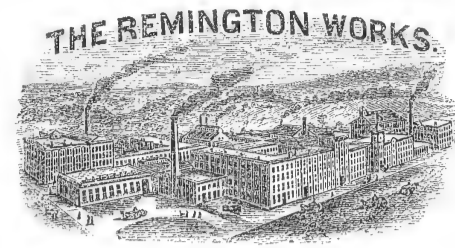

Our columns will always contain the cream of the latest foreign sporting news.

In a word, we are prepared to print a *live* paper and a useful one. We shall not be parsimonious in securing the best material for its columns. We are convinced that there is a standard of eminence and usefulness not yet fully attained by any sporting journals in this country. To this we aspire. It will be our ambition to excel; and we have relinquished a life of ease and semi-indolence to take charge of the enterprise. This not of our own free choice, but at the solicitation of many hundreds of friends and strangers. We are ably assisted in our labors by a corps of valuable associates—men of age and experience, all of whom, with single exception, have been identified with leading journals for years.

MR. SIMON A. ATKINSON, connected with the Georgia press for over twenty years, has charge of the business affairs of the Company.

CHARLES HALLOCK, Managing Editor.

The Sanitarian.

A. N. BELL, M. D., Editor.

OPINIONS OF THE PRESS.

"The Sanitary question is now uppermost in the public mind, and it is gratifying to see that the discussion of it is not going to be kept as a 'mystery' in the medical profession. Every human being is concerned in this matter; and if sanitary science has any suggestions to make, they must be made directly to the people themselves. This is what the periodical before us aims to do, and this it is doing well."—*Popular Science Monthly*

"As its name implies, THE SANITARIAN is devoted entirely to Sanitary Science, in its liberal and proper sense. The field it occupies is a most important one, and the editor admirably qualified for the work he has undertaken."—*Medical Examiner*.

"Consistent with his announcement, Dr. Bell seems to have spared no pains to secure for the Journal the continued approbation of the public, by treating, in a clear yet comprehensive manner, of subjects with which the public are directly interested, and the importance of which cannot be overestimated."—*Appleton's Journal*.

"This is a Monthly Journal, containing original essays on various Sanitary topics, by some of our most prominent medical scholars, popular enough to be read with profit by every person who reads, and learned enough to be of great interest to medical men. It ought to be read and preserved by every family, because it teaches how to avoid numerous causes of disease, and to support health and vigor."—*The Israelite*.

"A thorough-going Health Journal—not the cheap popular thing which generally goes current under that title, but a substantial register of Sanitary knowledge and science."—*Christian Standard*.

"Of a much higher grade than is common to our health publications."—*Watchman and Reflector*.

"THE SANITARIAN ought to be in every family on account of the practical common sense manner in which it treats questions of public and private health."—*The National*.

Annual Subscription, \$3 in advance. Single copies, 30 cents.

APPLETON'S
American Cyclopaedia.

NEW REVISED EDITION.

Entirely re-written by the ablest writers on every subject. Printed from new type, and illustrated with Several Thousand Engravings and Maps.

The work originally published under the title of THE NEW AMERICAN CYCLOPAEDIA was completed in 1863, since which time the wide circulation which it has attained in all parts of the United States, and the signal developments which have taken place in every branch of science, literature and art, have induced the editors and publishers to submit it to an exact and thorough revision, and to issue a new edition entitled THE AMERICAN CYCLOPAEDIA.

Within the last ten years the progress of discovery in every department of knowledge has made a new work of reference an imperative want.

The movement of political affairs has kept pace with the discoveries of science, and their fruitful application to the industrial and useful arts and the convenience and refinement of social life. Great wars and consequent revolutions have occurred, involving national changes of peculiar moment. The civil war of our own country, which was at its height when the last volume of the old work appeared, has happily been ended, and a new course of commercial and industrial activity has commenced.

Large accessions to our geographical knowledge have been made by the indefatigable explorers of Africa.

The great political revolutions of the last decade, with the natural result of the lapse of time, have brought into public view a multitude of new men, whose names are in everyone's mouth, and of whose lives every one is curious to know the particulars. Great battles have been fought and important sieges maintained, of which the details are as yet preserved only in the newspapers or in the transient publications of the day, but which ought now to take their place in permanent and authentic history.

In preparing the present edition for the press, it has accordingly been the aim of the editors to bring down the information to the latest possible dates, and to furnish an accurate account of the most recent discoveries in science, of every fresh production in literature, and of the newest inventions in the practical arts, as well as to give a succinct and original record of the progress of political and historical events.

The work has been begun after long and careful preliminary labor, and with the most ample resources for carrying it on to a successful termination.

None of the original stereotype plates have been used, but every page has been printed on new type, forming in fact a new Cyclopaedia, with the same plan and compass as its predecessor, but with a far greater pecuniary expenditure, and with such improvements in its composition as have been suggested by longer experience and enlarged knowledge.

The illustrations which are introduced for the first time in the present edition have been added not for the sake of pictorial effect, but to give greater lucidity and force to the explanations in the text. They embrace all branches of science and of natural history, and depict the most famous and remarkable features of scenery, architecture and art, as well as the various processes of mechanics and manufactures. Although intended for instruction rather than embellishment, no pains have been spared to insure their artistic excellence the cost of their execution is enormous, and it is believed they will find a welcome reception as an admirable feature of the Cyclopaedia, and worthy of its high character.

This work is sold to Subscribers only, payable on delivery of each volume. It will be completed in sixteen large octavo volumes, each containing about 800 pages, fully illustrated with several thousand Wood Engravings, and with numerous colored Lithographic Maps.

KEY TO North American Birds. BY ELLIOTT COUES, M. D.

This will consist of 359 imperial octavo pages, and will be illustrated by 6 steel plates and 238 wood cuts. It is designed as a manual or

TEXT BOOK OF THE BIRDS OF NORTH AMERICA,

and will be an exponent of the latest views in ORNITHOLOGY. The introductory part will give a general account of the ANATOMY and CLASSIFICATION OF BIRDS, and full explanations of all terms used in Ornithology. A KEY to the genera and subgenera will follow in the form of a continuous artificial table, while a

SYNOPSIS OF LIVING AND FOSSIL BIRDS

will contain concise descriptions of every North American species known to this time, with characters of the higher groups and remarks relating to forms not found in North America.

Price \$7.00 a Copy in Full Cloth Binding.

Hallock's Fishing Tourist,

The Fishing Tourist, Angler's Guide and Reference Book.

BY CHARLES HALLOCK,

Secretary of the "Blooming-Grove Park Association

ILLUSTRATIONS, CROWN 8VO., CLOTH \$2.00.

Mr. Charles Hallock is one of the few gentlemen who write a book mainly for the reason that they have something to write about—have something to tell the public which the public desires to know. The shortest routes to pleasure are laid down, and correct information is given as to the best means of conveyance, the expense of the trip, the secrets of the commissariat, etc. The author has avoided the use of technical terms, and thus made his volume all the more acceptable.—*Turf, Field and Farm.*

II.

Prime's I Go A Fishing.

I Go A Fishing, by W. C. PRIME, author of "Boa Life in Egypt," "Tent Life in the Holy Land," etc.

CROWN 8VO, CLOTH, BEVELED EDGES, \$2.00

It abounds in pleasant episodes, charming and vigorous descriptions of scenery and character, is distinguished by a refined wit, a droll humor, a strong love of the beauties of nature, and an enthusiastic devotion to the piscatorial sport. This book will please all who admire heartiness of style and exuberance of animal spirits in their authors. There are some interesting and well-told stories scattered through the volume, which exhibits on almost every page the handiwork of a man of graceful culture and wide reading.—*Boston Daily Globe.*

[The new Tribune Building stands upon the old site, and will be the largest newspaper office in the world. It will be nine stories high, and will cost, exclusive of site, one million dollars.]

New-York Tribune.

The Leading American Newspaper.

"NEVER SO GOOD AS IT IS TO-DAY."

The unanimous and unsolicited verdict of the hundreds of thousands of readers of THE TRIBUNE, is that the paper was never so good as at the present time. During the past year it has enlarged its field and improved its facilities in every direction, and enters upon the year 1874, which is to be one of the most important in public and political affairs, with most encouraging prospects. THE TRIBUNE, however, believes in deeds rather than in words, in results rather than in promises. It points to its record and its columns for the past twelve months as the best evidence of what it has done, and the most satisfactory pledge of what it will do. All the distinctive features of the paper will be preserved and strengthened; the "Extras," whose sale has reached hundreds of thousands, will be continued; the front of its new building completed, and the present admitted pre-eminence of the paper, not only maintained, but still further advanced.

As an invaluable paper for the Farmers of the whole country THE TRIBUNE fully maintains its well known and admitted position. It publishes much more matter of interest to Farmers and their families than any of the strictly "agricultural" papers, and no Farmer can afford to be without it unless he can afford also to be without all the market reports—cattle, grain and produce—information of agricultural events and progress, and all the general news of the day. To every intelligent Farmer THE TRIBUNE is simply indispensable.

TERMS OF THE TRIBUNE.

DAILY, (by mail), one year, \$10.
SEMI-WEEKLY, one year, \$3; five copies, one year, \$12.50; ten copies (and one Extra), one year, \$25.
WEEKLY, one year, \$2; five copies, \$7.50; ten copies, \$12.50; twenty copies, \$22, and thirty copies, \$30.

Each person procuring a club of ten or more subscribers is entitled to one extra WEEKLY, and of fifty or more to a SEMI-WEEKLY. Papers addressed separately to each member of clubs will be charged ten cents additional to the above rates.

Specimen copies of either edition of THE TRIBUNE sent free on application.

Terms invariably Cash in Advance.

Remittances at sender's risk, unless in registered letter, by draft on New York, or postal money order.

Address: **THE TRIBUNE, New York.**

THE TRIBUNE EXTRAS.

Extra sheets issued occasionally, and containing the latest and best things in art, science, literature, history, and religious discussions. Half a million already sold. The series of fourteen Extras now published sent by mail to any address in the United States for One Dollar. Additional Extra sheets, containing the two recent novels, "May," by Mrs. Oliphant, and "Lords and Ladies," each by mail ten cents. Descriptive circulars, giving full details of the contents of each Extra, sent free on application.

Address: **THE TRIBUNE, New York.**

Sportsmen's Goods.

This Rifle, after being tested in the severest manner by the late Board of U. S. Officers, appointed by the Government to select the best arm for the service; and after examining over one hundred different systems, including the best guns of Europe, say of it, "that it is the best rifle they have seen, or of which they have any knowledge. They therefore recommend it for trial in the hands of the troops. A seven pound carbine on this plan, with coarse military sights, has made better targets at Creedmoor the past summer, than the best English and American target Rifles weighing 10 pounds and having peep and globe sights.

We are now making these guns to supply the numerous demands, and will soon have them in the market.

The following is our scale of prices:—
SPECIAL MAGAZINE RIFLE for large game, carrying from 3 to 8 cartridges, 70 to 85 grs. of powder, 350 to 400 grs. of lead, 8 to 10 lbs. weight.....\$60.00
and upwards, according to finish.

SPECIAL LONG RANGE MAGAZINE RIFLE for Creedmoor shooting, 90 grs. of powder, 480 grs. of lead, carrying 3 to 8 charges, weight, 10 lbs. from.....\$100
and upwards.

MAGAZINE RIFLES for general use. Carry 3 to 9 cartridges, 60 grs. powder, 350 grs. lead \$ from.....\$40.00
and upwards.

SINGLE BREECH LOADERS for long range Creedmoor shooting, 90 grs. powder; lead, 480 grs., from.....\$60.00
and upwards.

SINGLE BREECH LOADERS for general use, 6 to 7 lbs., 60 grs. powder, 350 grs. lead, from.....\$30.00
and upwards.

The calibre of all our rifles, unless otherwise ordered, will be 45-100.

All communications should be addressed to

BETHEL BURTON,

Care Ward & Co., 54 Wall St., N. Y.

HAZARD POWDER CO.,

MANUFACTURERS OF

Sporting, Rifle and Target GUNPOWDER.

VIENNA, AUSTRIA, Nov. 30, 1873.

Messrs. Wm. S. Kimball & Co.:

SIR—A friend of mine sent me, with a transport of Indian Skins, two pounds "Vanity Fair," which I declare to be the best Tobacco I ever smoked. We have very good tobacco in Vienna—Turkish and Hungarian, but "Vanity Fair" is the King of all, by its aromatic flavor and the right sort of strength. My friend in New York got an appointment in California, by that reason I apply immediately to you, begging you to send me for the enclosed ten dollars, a supply of "Vanity Fair," and send with the next steamer to Germany. If there is a German firm that sells your excellent "Vanity Fair," I beg you to enclose it in the address.

Dr. Jos. Hyatt.

Professor of Anatomy in the University of Vienna.

REMINGTON'S

Sporting, Hunting and Target Breech-Loading

Rifles and Shot Guns.

Long Range Match Rifles for "Creedmoor" Shooting, now ready. The same as won the "Turf, Field and Farm" Badge, Aug. 2, and "Amateur Rifle Club" Badge, Aug. 9. See reports. Unequalled for accuracy by either Breech or Muzzle-Loaders of other makers.

For simplicity of mechanism, ease of manipulation, quality of workmanship and material, accuracy of range, and penetration, WITHOUT COMPARISON.

"It is a noteworthy fact that though many different kinds of rifles were used in the several matches, including the converted Springfield, Remington, Metford, Ballard and Ward Burton Rifle, every prize in all the matches was won by those who fired with the Remington rifle, except the last."—From N. Y. Times, June 22, 1873.—(See full report.)

The Remington Rifle won Twenty-two

out of Twenty-three Prizes at

the Creedmoor Meeting,

June 21, 1873.

Also, Revolving, Repeating, Deringer, and Vest Pocket

PISTOLS & RIFLE CANES.

—OUR—

Double Barrel Breech Loading Gun

IS NOW READY.

The best ever offered, containing all the most desirable features of the best imported, together with some valuable improvements peculiar only to this gun. Top Snap action, half-cocked, breech opened and shells extracted by one motion.

FOR SALE.—One of the handsomest and largest Dog in New York. The dog stands 31 1/2 inches high, and is 6 feet 6 inches in length from tip of nose to end of tail; weight about 140 pounds; color, coal black. The dog is three years old, and is kind, gentle and well broken, and would be invaluable for the protection of a country house. The dog is the property of a gentleman who sells him only because he is too large for a small house. Address M., P. O. Box 5370 New York.

Terms, Five Dollars a Year.
Ten Cents a Copy.

NEW YORK, THURSDAY, JAN. 29, 1874.

Volume 1, Number 25.
103 Fulton Street.

A FORECASTLE YARN.

For Forest and Stream.

BY MARTINGALE BOBSTAY.

It is of the good yacht "Nonesuch"
I'm going for to tell,
And the peculiar circumstance
That unto her befell:
'Twas about a dozen years ago,
Or mayhap a trifle more,
That craft swung to her anchor,
Off the Staten Island shore.
Her owner was Dick Flasher.
Of a social habit stock,
One of the old three bottle men,
A "chip of the old block;"
A good bit willful, in his way,
Ah! wouldn't he carry sail!
When 'twas greasy up to windward,
And blowing half a gale.

The season for the races
Had started up the gents,
And daily the excitement
Was a getting more intense;
For every jaunty skipper
Had his touching up to do,
To be ship-shape, and a taunto,
For the day of roudy-voo.

Well, the Nonesuch was as rakish
As a Yankee privateer;
A gently swelling water line,
Clean run, and easy sheer.
Her masts were tall and taper;
Her cable had a spring,
And she sat just like a sea-bird,
All ready to take wing.

'Twas a pleasant summer evening,
In the balmy month of June,
When all the bay was dancing
In the glimmer of the moon;
The owner had a jolly crowd
Of friends aboard that night,
And the champagne corks were poppin',
While the boys were getting tight.

'Twas then that Flasher struck his fist
Upon the capstan head,
Swaying about upon his pins,
As "eight bells" struck he said:
That by the "Flying Dutchman,"
He was bound the cup to win;
Or, once outside of Sandy Hook,
He never would come in.

Well, sir, if you'll believe me,
When the spurt came off next day,
One schooner was a missing
That started down the bay;
The wind was from the south'ard,
And the fog rolled in from sea,
And everybody wondered
Where the Flasher boat could be.

With spy-glass at the Highlands,
Dick's friends did watch for him,
Until they all did specify
That he had "doused his glim;"
And when the wind was piping,
Or the weather growing thick,
They drank unto his memory,
In "Green-seal" bought on tick.

At last arrived a fishing-smack,
One of the down East sort,
Whose captain said he met a yacht,
That asked him to report;
Her name it was the Nonesuch,
She was crowding on all sail,
Chasing another clipper,
That was scudding with the gale.

The sails were torn and dingy,
That once were white and new,
The taper masts were badly sprung,
The sheer was not so true;
Her gray-haired crew in tattered rig,
Looked wistfully ahead,
And the champagne corks were poppin',
As the stranger onward sped.

You see, the "Flying Dutchman"
Had chanced to come ashore,
And noted in his log-book,
The oath that Flasher swore.
So ever since, in gale and fog,
The race goes round about;
But Dick is bound to win it,
If the liquor don't give out."

Summer Sports in Canada.

Pêche à Malcolm—ON THE NORTH ST. ANNS.

ON my return from *Belle Truite* I paid Charlo in full and made arrangements with him by which he was to hold himself in readiness to accompany me to *Pêche à Malcolm*, on the North St. Anns, a trip I had long contemplated, while I went into Quebec to replenish my sadly depleted stock of flies and tackle.

On my return I met Mr. Charlo staggering along the road most gloriously drunk. He had taken advantage of my absence and wended his way to the settlement and there exchanged his earnings for David's high wines. To all my abuse, he only replied with a drunken laugh, snapping his fingers and attempting to perform a pirouette, which, to my no small delight, landed him in the ditch beside the road, on his back, where I should have allowed him to remain had not Charley Wolff, through a sympathetic feeling perhaps, helped him out and bundled him, head foremost, into the cart.

These Indians are unreliable dogs when within five miles of whisky, though trustworthy enough in the bush and good guides and camp men.

The sportsman visiting this region for the first time, unless ambitious of penetrating far into the wilderness, would do well to procure the services, as guides, of some of the old settlers, many of whom are familiar with the good hunting and fishing grounds in the closer proximity of the settlements. George Neil, of Valcartier, is considered by the many Quebec gentlemen who employ him to be the prince of hunters and good fellows, and the fact remains unchallenged. His charges are, I believe, one dollar per diem and board.

For distant journeys, an Indian guide is indispensable, owing to their superior knowledge of woodcraft and the interior of the country. The sportsman, in the latter instance, must come prepared to do battle with those pests of the wilderness—the black flies, and to suffer some of the privations that the limited amount of baggage which himself and guides can carry over the mountains, will entail. His initiation may prove a severe one, but he will never regret it. The beauties that will be opened up to him at every step, and the sport he will enjoy, either with his rifle or rod, as chance or fancy may dictate, will prove an ample recompense. I am not an enthusiast myself over hunting, though let me add, I have witnessed, and at times enjoyed good sport with both rifle and shot gun. If little is said in these articles about it, it is not on account of any scarcity of game, but the inclination to pursue it. I am at all times more at home with a fly rod in my hands than with rifle or gun, though I never go into the bush without one or the other.

For the benefit of the hunter I will here give a short resume of the game most to be met with. First in order comes the moose, cariboo, lynx, and bear, and then follows the small fur-bearing animals, such as the fox, beaver, otter, fisher, and mink. Wild fowl and partridges fill up the list.

I made up the packs in the evening in the bark *corseau*, the most convenient for carrying during the warm weather, when a blanket pack would act very much like a blister. It is constructed from a large sheet of balsam bark, doubled in two and sewed up at the sides, a couple of hoops like those of a barrel are then fastened inside to keep it distended, and it is complete on the addition of a pack strap, which, when ready for carrying, is placed across the chest and shoulders, the *corseau* resting on the back. If properly made, it is waterproof, and fish are more easily transported in them when salted for keeping.

Before dawn I was down at Mr. Neilson's and found Charlo sober after his night's rest. We crossed the river on the flat, and at sunrise we halted at the falls on the river *Aux Pins*, and on a large rock lighted our fire and prepared the morning meal. This little river literally teems with trout, and I have known one rod to take out in a few hours

ten dozen, though few would exceed a half a pound in weight. At its entrance into Lake St. Joseph, good bass fishing can be had by trolling. Near us are the vestiges of a settlement, attempted years ago, though abandoned on the death of the founder and the consequent giving out of the means necessary to carry it to a successful completion. Our road is along the river until we reach the lakes of the same name, five in number. We skirt the first two and then strike over the mountains to the west. Near the junction of the St. Anns and Tuillerie Rivers, we crossed the latter by wading through its rapid current. The river was high, and when I reached the middle of the channel the force of the waters almost swept me from my feet, and I deemed it politic to remain quiet until helped out of the predicament by Charlo's coming to my assistance. Here it was that I met with the first evidence of those fearful hurricanes that sometimes sweep through the gorges of the mountains, levelling everything before them. They are termed wind-falls. This one was some two acres in width and miles in length. Such had been the force of the storm that not a twig was left standing. Mighty monarchs were lying uprooted and so snarled among the others that a way was with difficulty forced through it. The Indian takes advantage of it to set his snare for the unsuspecting cariboo or moose that attempts to cross it. At irregular distances a sort of road is cut or cleared through it, and in the centre, carefully concealed from view, is spread out the fatal noose elevated about a foot above the ground. It is then fully secured to a sapling which is bent over some projecting tree. The deer gets his foot into the noose, and disturbing the spring, it jumps up firmly, fastening the noose about the leg. All its frantic efforts to free itself are unavailing, and the rifle of the Indian puts an end to its existence. Numbers are in this way taken every season.

We camped this night on a little hard wood knoll above the river. I shot a number of partridge, and these served up *à la sauvage*, are a dainty tit bit. With a dog to rise them, a very handsome bag might be made with a gun in a few hours. Sometime after dark I was startled by what I at first thought was a human voice some distance shouting "he! he!"

"Charlo," I said, "there is some one calling."

He smiled, and asked me if I had forgotten our old friends, the loons.

I comprehended it all now in a moment. There is scarcely a lake of any size that is not inhabited by a pair of these singular birds. The cry we heard was from a loon on *Grande Lac*, fully a mile and a half from where we were camped.

We journeyed up the river next day, alternately in the water and along the bank, as the exigencies of the case required. In the afternoon we reached the *Pêche à Malcolm*. Long before we arrived I saw the frowning mountain, *la Bee de la Perdrix*, that stands sentinel over the pool. It rises itself six or seven hundred feet perpendicularly from the river which flows deep and silently at its base; on the east side the river widens and forms a pool several acres in extent. A hard gravelly bottom with numerous cold springs gushing from the banks and the opposite cliff forms the *Pêche à Malcolm*. It derives its name from a Mr. Malcolm, who fished this pool, and in a week's sport took out several hundred trout, running from one and a half pounds to five. They smoked their fish and constructed themselves a dug out, and awaiting a favorable rise in the river, which takes place rapidly after a rain, floated down to St. Raimond with their booty. One party only has visited it since; my old companion, Mr. Neilson, and Charlo, and the success of that trip told in my old friend's graphic style, inspired me to the present undertaking.

We constructed our bark cabin on the site of the old one, and having put together a raft, I spliced my rod in the evening and selected my most tempting flies to be fully prepared for the struggle with the mighty denizens of the pool. At dawn I shoved off on the raft above the pool, and drifting down a short distance, anchored. The first cast is over an old sunken log, the fly hovers over it for an instant and lightly touches the water. A moment more and it is seized

and I feel that I have met a worthy foe. He darts down stream, rapidly reeling out fifty yards of line before I give him the but, and turn him back to the pool where he sulks. Gently I bear on him and he turns once more down stream, giving a series of jumps out of water, the pliant rod bending to his waywardness. For the last time I turn him, and I bring him exhausted beside the raft and successfully land him. Three pounds and a half, fully, and I survey him with much complacency. My next cast was not so successful. In the excitement of the moment I struck too quickly, and after a short run I lost him. My next is two pounds, and the next three and over. I must do better than this! In my fly book was a very ancient salmon fly, gorgeous in its colorings, and fully an inch and a half long. I attached it as the tail fly and cast far out under a projecting rock that threw its shadow over the pool. A splash follows, and a five pounder rises, and seizing my salmon fly goes down. He remains quiet a moment, preparing for the mighty rush that followed. My line is all run out before I give him the but. Snap! my salmon fly has parted from the gut close to the shank. So much for using old flies. When the sun peeped over the tree tops, warning me to return to breakfast, I had a half dozen more varying from one and a half pounds to three.

Trout will seldom rise to a fly during the glare and heat of the day, and even should they, the black flies would render fishing anything but a pleasant pastime.

Having the greater part of the day before us, I determine to climb the mountain from the side above the pool. Our luncheon is put up, gun and ax slung, and crossing the river we commence the ascent. I have never made an accomplishment of crawling up side walls, fly like, though I claim to be able to hold my own under most circumstances. A dozen times did I regret having been so foolhardy as to attempt it, but I was bound to succeed now. By a series of hauling, pushing and catching at stray bushes that hold out their assistance, we finally reach the top, and seating myself on an inviting rock, I abandon myself to the charming vista spread out before me. Dozens of lakes peeping from their varied green surroundings, the St. Lawrence, a mere sinuous thread in the far distance, while the little camp at our feet, from which the smoke of the fire curls upwards, is lilliputian in its dimensions. The wild glen, through which the St. Anns discharges itself in a series of falls, is plainly visible.

Charlo selects a favorable spot near the verge of the cliff, spreads out the luncheon, to which we both do more than ample justice. Pipe follows, and we sit there and discuss the question of the names of the different lakes visible. That evening's fishing resulted in some handsome fish, the largest three and a half pounds. Next day we visited the falls five miles above our encampment. They are three in number with a fall each of twenty-five feet with deep pools intervening, out of which I took some dozens of good sized fish. This was another day of great enjoyment, and with a sigh, I gave the order for our return on the morrow, for all things must come to an end, and the inventory of our provisions show they are fast coming to a similar end.

The wind must have changed during the night, for I awoke with a sense that I was choking, which was not far from the truth, for the smoke was pouring into the camp in a cloud. I beat a hasty retreat, and being now fully awakened lighted my pipe and seating myself on a log beside the fire, gave utterance to a war whoop to clear my lungs and which brought Charlo to his feet in surprising short time under the impression perhaps that hostile savages were making a descent.

We packed up, and at dawn are floating down the river on our raft. The first few miles were uneventful until we got into the rapids. Half way down the ugliest of these, a huge boulder, rears its head, around which the water seethes and foams. It is too late to avoid it and we can only brace ourselves for the shock that follows. It comes, and we are driven high and dry on its surface. Charlo pitches forward and lands himself in my unwelcome arms. All our efforts to free the raft are unavailing, and we ruefully survey the prospect of a ducking before we can reach the shore. We are not disappointed, and resuming our packs mournfully take up our march. Next day we reached home without further event.

SNOW-SHOEING IN MAINE.

WE left Greenville, at the foot of Moosehead Lake, one bright morning in February. The day before we had supplied ourselves with an outfit for moose hunting. Anance, the aged Indian, chief of the Abenakis and St. Regis tribes, a mere handful now, had been engaged to go with us as guide, and from him we obtained snow-shoes, moccasins, a sled, and other things indispensable in a winter camp.

We were to travel on the frozen lake to the northwest "carry," the extreme northern end, forty miles from Greenville, where our first night's camp would be. Four feet of solid ice, with water and snow covering the lake, made the going bad. Our conveyance was a two horse, open-box sleigh or pung, in which everything except the sled was packed. At noon we had reached Mt. Kineo, where we warmed up before the log fire in the hotel, and obtained a nice dinner of caribou venison and lake trout.

Mt. Kineo is a prominent feature of Moosehead Lake, a miniature mountain, with precipices and frozen cascades projecting from the eastern shore into the lake. It is reached by steamer in summer, but in winter few except lumberers and hunters pass this way.

Leaving here a little after noon, we started on the remaining twenty miles of our journey over the lake. The snow became deep and trackless, although the road had been "bushed" with small spruces. The stout horses gave signs of failing, and at the end of a few miles our driver declared that to attempt to drive to the carry would kill the beasts. A hurried conversation was held, and we decided to snow-shoe it. Soon our traps were got out and packed on the sled, snow-shoes fastened on, and we set off, dragging the sled, while the team slowly made its way back to Kineo. A good crust made travelling easy, and before dusk we had done ten miles or more. Mount Katahdin's snowy sides were standing boldly out to the northeast over the black shore line of spruces. We were already in sight of the carry when a snow squall came sweeping down upon us, and almost without warning we were in darkness, the whirling, driving snow blast obliging us to cower before it with our blankets held tight over our heads. After some aimless attempts to reach the shore, we gathered about the sled, and by the light of a match under a blanket took an observation of the pocket compass. To our surprise we had left the course and were heading away towards the western shore. There was nothing to be done but to wait. The squall passed off, the shores were in sight again, and our journey resumed.

It was now raining, and the softened snow clung to our snow-shoes until the weight became most trying. At nine o'clock we reached northwest carry, and threw ourselves down exhausted on the snow. Anance soon had a fire going, and after a drink of hot tea, and a biscuit, we started on the two miles across the carry, where a wooden tram road had been built by lumbermen, connecting the lake with the west branch of the Penobscot River. Slowly we dragged ourselves, stopping often to rest before we reached the deserted log cabin, where a roaring fire in the stove made all comfortable, and we stretched our tired limbs on the spruce boughs, content to have shelter, though our feet were chafed and smarting from the unaccustomed tramp of twenty miles on snow-shoes. Never, except in an emergency, should a novice in snow-shoeing attempt a long tramp at starting. He will find locomotion impossible for some time, and may lose several days in recruiting.

In consequence of our first day's shoe tramp we lost the whole of the next day, being laid up with stiff and aching limbs and sore feet, so that lying on the boughs, or putting guns and ammunition in order, was our only occupation. We were to travel up the west branch of the Penobscot on the ice, then, following up the Elm stream, a tributary from the north, to reach the hunting grounds and make camp at night.

It was a clear, bright morning when we set off from the "carry," the crust on the river ice being so firm that snow shoes were not required, except when open water, caused by rapids, obliged us to take a short detour in the woods. Tracks of caribou (*Loup cervier*, or *Lucivee*, in hunter's parlance) were frequent, and an occasional otter's slide on the snow banks, near openings in the ice. Anance brought with him several traps for beaver and mink, which are still quite plenty in Maine.

Passing Babb & Stricklan's lumber camp, now deserted, we arrived at the mouth of the Elm stream about noon, and indulged in a tin cup of hot tea and some slices of cold raw salt pork and biscuit, the pork being a new experience to one of our party, a novice in moose hunting, who, being born a true Briton, had all the native pluck and endurance so necessary in this kind of hunting. Young G. did not expect to find luxuries in the woods in winter, and relied on a glass barrel of whiskey which he carried wrapped in his buffalo robe and strapped on his back through the whole trip.

N., a civil engineer and an experienced moose hunter, who knew the importance of throwing aside every unnecessary ounce of baggage, had insisted on our travelling as lightly as possible, so that one sled had sufficed for all our traps. Each of us, except the Indian, carried a buffalo robe containing a change of socks and other smaller articles. After leaving the river we found the snow in the "tote road" deep and yielding. Snow-shoes were put on, and now came additional work in hauling the sled over snow hummocks and through brush, with frequent slewings and upsets. Anance drew with the rope across his chest, Indian fashion, following the track beaten down by our snow shoes. However, after several miles of wearisome pulling, the sled was abandoned at the side of the road. After distributing the provisions in our packs we pushed on through spruce and hemlock swamps, open timber, beech, birch, and straggling moose wood, and just at dusk we found the ruins of a lumber camp, all that remained being a portion of the roof buried in snow, but having a space under it quite dry, and large enough for our party to crawl under and even sit upright. To work we went, using our snow-shoes for shovels, and cleared a space for a fire, which was soon blazing in front of our apology for a camp.

I should mention that before leaving New York we had, at the suggestion of N., provided ourselves with buffalo robes sewed up so as to form bags, with the hair inside, into which we crawled feet foremost, drawing the mouths together over our heads. This was a comfortable arrangement until the melted snow, dropping from the roof, soaked the hides, and our bags were frozen stiff before morning.

There is little romance about a winter camp. Snow scenes are not "beautiful" to eyes moist and inflamed by smoke and snow glare, and when the body is frozen and thawed by turns. True, there is a grandeur in the moonlit forest, or when the branches crash and crack before a gale,

but there is little comfort or luxurious ease in winter camps.

In recalling the hardships and exposure that attend winter hunting and sleeping in the snow when overtaken by night, I can yet affirm that we gained much strength and renewed health by snow-shoeing in Maine, New Brunswick, and Nova Scotia.

Our first hunt was a reconnaissance. Anance led off through the spruces loaded with snow, gradually ascending to hard wood ridges, where we looked for signs, or "ravages," as the Canadian French hunters call the work of the moose made by browsing. Towards night, having found no fresh signs, and when nearing camp I wounded a white hare with a ball, and following, intent on hare soup for supper, I became separated from my companions. Suddenly I found myself in a moose yard. I heard them crashing through the forest, but could see nothing as they went off. Their tracks were like those of a horse in deep snow. Marking the spot I returned to camp, whereupon I was taken to task for starting the moose so late in the day.

We were to move camp next day to another lumber camp, which we hoped to find habitable. While on our way a fresh moose track was found crossing our path, evidently my frightened game of yesterday. Here was a lucky find, as we could follow and "still hunt" them as soon as our new camp was established. When found, the lumber camp was literally snowed under, and it required much shovelling before the door was found and we got in. There were the Deacon seat and spruce beds ready for use. A square altar of pure white snow stood in the centre, under the smoke hole in the roof, the accumulations of a winter's storms, and the rest of the day was spent in clearing the snow out, getting firewood, and making things comfortable. The weather, which had been clear and cold, soon changed to clouds, with snow, which fell incessantly for two days, an addition of nearly three feet, and making about eight feet on the ground. The light snow was suitable for still hunting, but the travelling was more difficult. At every step one raised a small mountain on the toe of each snow-shoe, and our pace was slow as in single file we followed the tracks of the moose. A bed or hollow in the snow under a large spruce tree showed where the moose had passed the night previous. Thence he went on with many devious turnings, plucking buds and browsing on young spruce trees, breaking off the tops and strewing the snow with branches; "ravaging," in fact, the forest. The signs grew fresher. We were now on a track made within an hour, and if all the rules of still hunting were observed we might have moose meat for supper. Cautiously moving foot by foot, watching the drooping mosses to keep against the wind, we approached. Suddenly a huge black object rose slowly from the bushes; first a long clumsy head and pendulous snout held high in the air, listening. A moment's delay and away he dashed. I took a quick sight and fired. Now the chase began. Slipping over, and tripping into the deep moose tracks, or cutting off by detours, we followed on. Another shot from N., and we knew the game was ours. Coming up, we stood about the monster, admiring his strong limbs, and wondering at his ugly, uncouth head, small cunning eye, and large asinine ears. The snow was soon trampled and dyed with the creature's blood, as with skillful hands Anance removed the hide and prepared the meat, all to be left covered with snow to be hauled to camp when convenient.

Moose meat is very good eating, and is highly prized by the Maine backwoodsmen in their winter larder. We carried to camp sufficient meat for present use, the result being a series of savory broils, stews, and "brochettes" made on spruce sticks instead of silver skewers.

Snow continued falling for several days, during which we could not hunt, but took comfort in our snug camp. Then we repacked buffalo robes and started for home.

I shall not attempt to describe the march of eleven miles back to the "carry." At dusk we were still following down the west branch of the Penobscot, almost exhausted. Indeed, we could not climb a few feet of the river bank without resting and draining the few drops of G.'s precious whiskey. At the cabin we found a party of lumberers, driven out of the woods by the deep snow. Down the lake men and oxen went in single file, and at Kineo we began to taste again the sweets of civilized life and the "bouquet" of Chenery's burgundy.

JOHN AVERY,

Secretary and Engineer Blooming Grove Park.

LOOSE LEAVES FROM A SURVEYOR'S JOURNAL.

INJUNS AND A HARD TRAMP.

EDITOR FOREST AND STREAM:—

I HAD been out two or three trips for the company, when I sent for "Mot," my old room mate. The company wished some land looked up beyond the Black river and a return made in time for a sale. It would be a long, hard journey and return through the unbroken woods, skirting swamps, and over a rough country requiring a party of more than ordinary mettle to get back in time. I knew for pluck and endurance, combined with great social qualities, Mot was just the boy for the occasion. For he had a heart as large as the circumference of his compact little body, (for its genial warmth permeated his whole system,) while physically he was as tough as a pine knot, and give him plenty of fuel, that is, his rations, (I don't mean fluids) regularly and in sufficient quantity, and his pluck would carry him through almost anything. His sympathies, too, were always on the alert; he would have made a splendid knight in those days of chivalry, in relieving distressed maidens and doing battle for the oppressed.

We had been but a few days on our trip, and had stopped by the side of a path that wound around the base of the mountain, and were debating whether to take the longer route by the path or with our heavy packs climb over the mountain, when we were startled by the sound of whistling and of horses' feet approaching. There soon appeared a young Indian mounted on his mustang or Indian pony. He sat bolt upright, with his blanket thrown carelessly over one shoulder, while his rifle in his hand was thrown across in front of him. He seemed in a pleasant mood, and as he went by he nodded and gave us the usual "Bozu," which I returned. Following at a short distance came his squaw, loaded down (as usual) with all the traps and paraphernalia of a Nitchee "on a move," wigwam poles, skins, pots, bundles, &c. Poor thing, she was bent nearly double; and she could hardly stagger along under the load that would have been too much for a strong man. Knowing the character and custom of the Indians I merely said, turning to Mot, "rather tough, isn't it?" and I was about to resume the journey, when Mot replied, with flashing eyes, all the spirit of chivalry and honest indignation aroused within him, "tough? it is outrageous; I won't stand it; will you stay by me, George?" "What do you propose to do?" "Do? I mean to right that poor woman and make that red scoundrel treat her like a Christian." I said, "it won't do, Mot; that is their way, as hard as it appears to us, but it is none of our business; the men never do any labor themselves, the squaws do it all." But with tears in his eyes the boy begged me not to deny him. Considerably perplexed, somewhat curious, and not a little amazed, I said, "well, go ahead." He rushed up to the Pottawattamie, saying, "here get off that horse," took the pack from the squaw and commenced dividing it into three parcels, all the while expostulating in no gentle tones with the Indian, who seemed thunderstruck at the movements, but looked on in dogged silence but with glittering eyes. Once or twice his hand reached down for his knife, but as my double barrel, with both hammers up, was bearing on his breast, a look from my eye caused the hand each time to retreat. Mot says, "you scoundrel, to treat your wife so." "Ugh! my squaw." "Your squaw," replied the knight errant, "she is your wife in the sight of God and man, and you ought to be strung up for such dastardly treatment." The squaw didn't seem to like the change either, but Mot was inexorable. After dividing the pack, having given one to the squaw, and with considerable difficulty fastened another on the back of the pony, which, not being accustomed to such things, danced around pretty lively, he placed the other on the Indian's shoulders, and then I thought there would be a fight sure; twice he had his knife half out of his sheath, but my threat to shoot him down then and there each time deterred him. Mot said, "there, you scoundrel, go on; and if I ever know of your treating your wife in that way again I'll break every bone in your body." With sullen silence, leading the pony, the Pottawattamie disappeared around a bend in the path. "There," said Mot, drawing a long breath, "I've done one good deed." "Done a good deed," I replied; "do you know what you have done? You have not only made an enemy for life, and very foolishly too, but you have caused that poor squaw to get one of the worst whalings she ever had in all her servitude. That arrangement won't last ten minutes, and I will prove it to you, but you must promise not to interfere again, for this is too ticklish business for us here alone in the woods. An Injun never forgets an insult of such a kind, and it will be his consummate cowardice that will prevent his following us and knifing us in our very beds." "Poh! I'll risk that; I ain't afraid." "Well, I don't know as I am afraid exactly, but it don't pay to take such chances."

Now to prove my first assertion, we struck across the mountain and hit the path on the other side before they got there. We had but just arrived at the path and concealed ourselves, when we heard the step of the pony, and as it came up there was Mister Nitchee on its back, (but he was not whistling now,) with only his blanket and rifle, while behind him, bent more double than before, tottered the poor squaw with all the load, and we could see by the furrows down her dirty and besmeared cheeks, and red, swollen eyes, that she had been having a hard cry. I placed my hand on Mot's shoulder, and it was all I could do to compel him to keep his promise and not again meddle in a matter that was none of his business. He learned more about Injuns and their customs afterwards.

The life of a squaw is a life of the most degrading servitude, from the sugar season in the spring—the only time when they seem to enjoy themselves, and then they give up to wholesale gossip and hilarity—through the corn planting, tending, harvesting, &c., to the trapping season in the fall, it is one long round of hard work, with kicks and cuffs only as pay.

The squaw does all the work, even builds the wigwam, cuts the wood, cooks the food, cures the skins, and when moving, carries all the loads. They ever object to their husbands doing work, as they say it makes his hand tremble, and he can't kill "heap game," a cunning dodge, no doubt, of the Indian on Mrs. Nitchee.

A group of squaws making sugar is a grotesque and amusing sight. As the time for the running of the sap approaches, a party of perhaps twenty or thirty families or more will gather in the woods where there may be a sufficient number of the maple trees. The wigwams will be built around in a large circle, the kettles, all small of course, holding perhaps only three or four quarts, (for in their many movings they could not carry larger ones,) strung on poles in a line with a continuous fire the whole

length. The sap is gathered in small baskets or buckets of birch bark, which are hung on the trees under where a downward gash has been made half girdling the tree. These buckets hold only a pint or more, and have to be gathered and emptied often. The boiling sap is kept almost continually on the move from kettle to kettle, until, towards the thirtieth or fortieth kettle or less, it is sugar and ready to be clarified or grained.

To be sure an Indian is not very particular in his tastes or neat in his domestic affairs, and if he comes home hungry is pretty apt to chuck into the boiling syrup the body of a squirrel or muskrat, or in fact anything else in the eating line, but the squaws have a way peculiar to themselves of clarifying it, and when they take pains it is a good article. They do it up in packages of birch bark, which are called *mocucks*, and when of fine quality it finds a ready market, though I have seen some Injun sugar that was simply abominably black in appearance and execrable in taste.

The Nitchee then takes the *mocucks*, or rather, compels the squaw to take them to the settlements, where he trades them off for whiskey, ammunition, whiskey, nicknacks, and whiskey, and if the squaw gets a string of beads or a red handkerchief and no kicks or cuffs from her drunken lord, she is indeed lucky.

As I said before, the happy time for the squaw is during the "sugar making." Then are they gathered together, and all their woman nature comes out strong, and like their lighter sisters, gossip is the order of the day. What a perfect babble of tongues; all are talking and gesticulating together; talk, talk, chat, chat, rattlety bang; with their rippling laughter now and then arising above all the clatter. The immediately surrounding trees and bushes are adorned (?) with many a pappoose, silently swinging back and forth, as the little occupant, with its shining bead-like eyes, watches the movements going on; uttering no cry under any circumstances; the rain may beat down upon their unprotected heads, or the hot sun may strike full in their dusky faces, no one ever heard an Indian baby utter a word of complaint. Every now and then a mother would jump up from her stirring kettle, seize one of the boards to which her offspring was strapped, clasp it to her breast a few minutes and then hang it back in its place. The nut-brown child of the forest had received its dinner. During this season the lord of the wigwam, if not off on a hunt, lies asleep all the day on his bed of skins or boughs. "Such is life," at least of the Pottawattamie, as I knew them.

We had crossed the Black river, made our examination of the land, and turned back, but alas, the river from a width of a few hundred feet now reached over half a mile, the water from the recent freshet had overflowed its usual bed and extended far into the woods. Our canoes were gone, our stock of provisions were only sufficient to reach the settlement on an ordinary occasion. Now we must take a weary tramp up the river, we knew not how far, until we found a crossing. A long and weary tramp we had. Often went we to our bed of boughs with empty stomachs. The game seemed to have left for parts unknown. Now and then we heard the woodpecker's gentle tap on the resounding tree, but when we looked for him, he was "non est," or we would hear the hoarse croak of a solitary raven, as he stopped for a moment on the top of a tall tree, adding only a greater depth to our sombre feelings. No deer, no grouse, no other living creature could we see.

We had been two days with only eight small crackers apiece, with our coffee; we were getting very weak. Poor Mot, a young Hercules with a full stomach, wilted like a child; his pluck was magnificent; although with difficulty he could lift his weary limbs over a two foot log, not a murmur escaped him. Being more hardened to such things I felt the matter much less, but oh, how I pitied him.

We were crawling through a poplar barren, when something flopped up and was gliding off through the bushes. My gun was at my shoulder in a moment, and as the smoke cleared away I had the satisfaction of seeing something pitch down through the leaves some forty yards distant. Mot's eyes glistened, and a fervent "thank God" broke from him. I, though somewhat pleased, did not feel quite so exhilarated, as I had rather a faint idea of what I had killed. Upon approaching the place, we picked up a large gray bird, a bird of feathered horns and monstrous eyes. I could not restrain my laugh, bad as I felt, at the expression on Mot's face, as he said, "is it an owl?" But we were hungry enough even for an owl. We carried him along over the barren until we struck down into a hollow and found a brook. I picked the bird while Mot made the fire. I cut up the fowl, and with pepper and salt put it into our pail over the fire; to be sure there were more bones than meat, and originally more feathers than both together, but we were very hungry. Now, I am aware that there is a very settled impression abroad in regard to owl as an edible delicacy, but I assure Judge M— and Tom J— that that owl soup was not to be laughed at or treated in a trifling way. I tell you it was a serious business to us. The soup was good, though I fully believe myself that an onion, with a carrot, a few sliced potatoes, a little celery, a taste of Worcester, or a dash of Cayenne, might have improved it some. We had rather a severe muscular tug, too, at the bones, and Mot remarked that, like the man and the cow, under the peculiar circumstances he could eat owl but that "he did not hanker arter it." If it did not exactly save our lives, we at least arose from that attack strengthened and rejuvenated. How good our pipes did taste, (perhaps your dainty city sport would think so after such a

delicacy,) as we laid back on a bed of moss, and took an hour's rest. I think that even Tom under such circumstances could have enjoyed a cigar, with no fear of a deleterious effect on his nervous system, (couldn't he, Lew?)

We found a place at last where by falling a tree we crossed the river; we were then by our reckoning twenty-seven miles to a settlement, a saw mill on one of the eastern branches. That morning we had ten crackers apiece left, including the crumbs. We calculated after eating four for breakfast we could reach a deserted shanty we knew of eighteen miles distant, that night, then four more crackers for supper, leaving two again for breakfast, with coffee for one cup apiece each time. The next day we thought we could easily reach the saw mill.

We fortunately found an old lumber road, and by following that we had easier travelling, and arrived at the shanty about two P. M. While getting ready for our supper and bed Mat looking up (and so hollow eyed and woe begone in all his appearance my heart smote me) said, "I think if I had those six crackers and those two cups of coffee in one, I could reach that mill to-night and get a square meal." Well, if you think so we'll try it. It was a hard way, but just before dark we reached the place; we found a jolly lot of lumbermen, and were made heartily welcome. After a good wash and a rest, we were called to supper. I had explained matters to the good woman and a large supply was placed before us. First I remember there was a large platter of fried venison, not less than ten pounds, to all appearances; roast potatoes, a good sized dish; broiled ditto; a large plate of hot biscuit, and an eight quart pan of fried doughnuts, with some kind of pie, I don't remember what, and a pot of tea.

I ate three or four slices of venison, with some potatoes, two biscuits and a couple of doughnuts, and drank two cups of tea. Mot had not said a word since we sat down, but I saw that he was going in heavy; in fact, was doing a good business.

I went out to the mill, smoked a pipe, and enjoyed a good talk with the proprietor. Nearly a half hour elapsed, when the woman came out, and consternation dire was depicted in her countenance as she exclaimed—

"For the Lord's sake, what kind of a man is that in there?"

"Why," said I, "what is the matter?"

"You told me you were very hungry, and I know what appetites men of the woods have, and I cooked for eight, but as sure as you live he has eaten everything on the table and is asking for more venison." Well, I replied, give him all he wants and charge accordingly in the bill. "Oh," she exclaimed, "it is not that. We have got plenty of it and he shall have all he wants, but where in the world does he put it? Are his legs hollow all the way down?" And Mot got it. Shortly after he came out pricking his teeth, saying he felt considerably better and could beat me clean out of my boots on a tramp the next day.

JACOBSTAFF.

MOUNTING DEER FEET.

EDITOR FOREST AND STREAM:—

No doubt, during the past shooting season, many of your readers have succeeded in bringing down the magnificently antlered deer, caribou, or moose. Most sportsmen like to preserve a fine pair of antlers, and frequently a hoof is made into some useful or ornamental article. The mounting of the hoofs in some form or other is generally expensive, and frequently it is very inconvenient to get either hoofs or antlers mounted by a skilled person. It is to those whose distance from skilled labor, or the trouble and expense connected with mounting horns or hoofs, often causes them to cast away many a pair of antlers or set of feet which they would gladly have kept, that I would address myself.

The feet of the deer, so generally thrown away, may be made to serve a variety of useful and ornamental purposes with a very little trouble. They make a pretty and appropriate gun or fishing rod rack; also, suitable pegs for hats or sporting accoutrements, and in conjunction with a pair of antlers form a very effective hat and coat rack for a hall. To make a gun rack take a piece of black walnut, ash, chestnut, or maple, about three inches wide, and one and a half inches thick. Plane it smooth, and if possible plane the edges with a molding plane; bore two holes, one near each end (say six inches distant), and at the same slant you wish your pegs to have; make the holes to fit the legs, which should have been cut off the length required. Immediately above the holes made to receive the legs, two small holes should be bored for the screws which fasten the board to the wall. Fasten it up, and you have a neat and handsome support for your gun or rod. A row of hat pegs may be made in this manner, and single ones may be made by using small squares of wood.

A coat and hat rack for a hall may be made by crossing two strips of wood diagonally, or arranging as taste may dictate, and inserting a deer leg at each extremity and one at the crossing. A mounted head or pair of antlers should surmount the whole, the antlers being simply mounted by being screwed or nailed to a piece of wood, either square or oval.

In conclusion, I would say that where black walnut or other ornamental wood is not procurable, a most excellent imitation may be made by using common pine. Buy a few cents worth of permanganate of potash; dissolve it in water, and stain your wood to any shade desired. When dry, varnish, and you will have an imitation of walnut that almost surpasses the original. Hoping the above may prove of use to some of your many readers, I remain,

Yours truly,

TRANSIT.

THE MOANING OF THE TIDE.

'T WAS a beauteous summer's night, the moon was shining bright;
I was dozing in my Sleepy-Hollow chair.
While dozing there I dreamed, and in my dream it seemed
To me that I was young again and fair.
I again was a young man, a courting Betsy Ann,
By the sea shore we were sitting side by side;
And though our hearts with love were stirred, we uttered not a word,
We were listening to the moaning of the tide.

But my dream was rudely broke by Betsy Ann, who spoke:
"I wish that you'd untie that horrid curl!"

Just listen to the tune, he's moaning at the moon,
And you've tied him up so he can hardly stir."
Then I bid my dream adieu, though part of it was true,
For Betsy Ann was standing by my side;
And though we were not by the shore, to hear the ocean's roar,
We were listening to the moaning of the tide. LUKE TRIPP.

For Forest and Stream.

TO A CAGED BIRD.

POOR bird! pine not because debarr'd
From drinking of sweet freedom's joys;
Secure from danger, death and noise,
Be philosophic—'tis not hard.

Enough to eat, to drink and spare,
So trim and neat thy cottage home;
Why should'st thou wish afar to roam,
Where lurks the spoiler and the snare?

Just think how many of thy race
To want, cold, sickness, fall a prey,
Whilst thou canst ply the livelong day,
In thy snug, cosy resting-place.

In vain I plead! You shake your head
And try the iron bars once more;
You'd barter all your varied store
Of sweets—have liberty instead.

Birdie, we share an equal fate,
I would that freedom's joys were mine;
Like thee I trouble and repine,
And rail against my present state.

And though enough to eat have we,
Yet life is but a dreary waste
To us who crave in vain to taste
The purer joys of liberty.

JAS. RUNNEGAR.

NEW ORLEANS, 216 Common street.

THE FISHERMAN'S SUMMONS.

THE sea is calling, calling,
Wife, is there a log to spare?
Fling it down on the hearth and call them in,
The boys and girls with their merry din,
I am loth to leave you all just yet,
In the light and the noise I might forget,
The voice in the evening air.
The sea is calling, calling,
Along the hollow shore.
I know each nook in the rocky strand,
And the crimson weeds on the golden sand,
And the worn old cliff where the sea-pinks cling,
And the winding caves where the echoes ring.
I shall wake them never more.

How it keeps calling, calling,
It is never a night to sail.
I saw the "sea-dog" over the height,
As I strained through the haze my falling
And the cottage creaks and rocks, well nigh
As the old "Fox" did in the days gone by,
In the moan of the rising gale.

Yet it is calling, calling,
It is hard on a soul I say
To go fluttering out in the cold and the dark,
Like the bird they tell us of, from the ark;
While the foam flies thick on the bitter blast,
And the angry waves roll fierce and fast,
Where the black buoy marks the bay.

Do you hear it calling, calling?
And yet, I am none so old.
At the herring fishery, but last year,
No boat beat mine for tackle and gear,
And I steered the coble past the reef,
When the broad sail shook like a withered leaf,
And the rudder chafed my hold.

Will it never stop calling, calling?
Can't you sing a song by the hearth?
A heartsome stave of a merry glass,
Or a gallant flight, or a bonnie lass,
Don't you care for your grand-dad just so much,
Come near then, give me a hand to touch,
Still warm with the warmth of earth.

You hear it calling, calling?
Ask her why she sits and cries.
She always did when the sea was up.
She would fret, and never take bit on sup
When I and the lads were out at night,
And she saw the breakers cresting white
Beneath the low black skies.

But then, in its calling, calling,
No summons to soul was sent.
Now—well, fetch the parson, find the book,
It is up on the shelf there, if you look.
The sea has been friend, and fire, and bread;
Put me, where it will tell of me, lying dead,
How it called, and I rose and went.—All the Year Round.

GUNS—A DIALOGUE.

SOME two hundred and fifty years ago, a great deal of information of an amusing or instructive character, was conveyed to the reader by means of the dialogue. We are not too old to remember when those solemn and preternatural little boys Sanford and Merton played a game at cross purposes, and when Julia asked her mamma realstunning posers about the moon, while Alfred put in, regarding the erratic motions of the stellar system, all of which problems, the mamma, a lady of the Somervillian type, answered in the most off hand and deliberate manner. In fact it was the chit-chat of no doubt a strictly astronomical, but very tiresome family.

Good old Isaac Walton loved the dialogue, and Piscator, Venator, Auceps and Coridon talk to one another most sensibly, and their quaint dialogue is one of the great charms of the most admirable of books, the "Complete Angler." Sir Humphrey Davy, not quite half a century ago, in somewhat stiffer and more stately style, pits Halieus against Poites, and Physicus against Ornithier, and we have given to us in this way all that the great savant knew about Salmonia, interpreted by his various *dramatis personae*.

This dialogue method, perhaps a trifle antiquated, recalling the classic Greek chorus, has of course gone out of fashion, but it is by no means improbable that it may not be in vogue again some day. Without being, however, desirous of reproducing this method of instruction, having simply heard our friends, Aries Virga and Papilla, talking about guns and breech-loaders yesterday, we transcribe their conversation without any comment of our own.

ARIES VIRGA AND PAPILLA—IN A CLUB ROOM.

Aries.—It is perfectly useless, you never can convince me that a gun fitted for a gentleman's use, which is safe or reliable and with any kind of penetration or precision can be produced by the gross.

Papilla.—Still it is within the bounds of reason. Egg or Manton or Beckwith or others who lived seventy-five years ago, who made guns for our fathers, certainly never thought so. But neither the inventive nor the mechanical power have remained at a stand still during this half century.

Aries.—In the first place the material in the guns those master artificers made up fifty years ago were better than what we use to-day. In old times they picked up all the horse-shoe nails to make the barrels with.

Papilla.—Now let us stop right there. It is quite probable that could we investigate it by any exact methods of comparison, we could show that gun-powder fifty years ago, was by no means as well made, nor as strong, nor as effective as it is to-day, and as for that, I think it has been demonstrated, that with a lighter quality of metal, our guns can stand quite as much rending or bursting power as the old fowling pieces. We have had forcedly to make better barrels, for stronger and more powerful powder. As to our capability of selecting soft homogeneous iron for gun barrels if we wanted to use it, which we do not, instead of our having to pick it up by the single horse shoe nail we could buy charcoal iron by the bloom, or ship-load, and have in a single bar all those excellent qualities which were only attainable seventy-five years ago, by collecting the material bit by bit. The fact is if you wish to make iron barrels, you might select iron from a hundred different grades.

Aries.—That is all book learning, the result, my friend Papilla, of your having attended some bothering course of scientific lectures. Well then, if they do use steel for barrels to-day it is because the iron was too bad. They cannot finish guns in this country as well as they do in England. No American guns have any finish to them. They may be all right, but I do not want to carry a gun which is not perfection—even if guns can be made by the gross.

Papilla.—Which shows your very excellent taste—'a thing of beauty is a—'

Aries.—Allow me. It is not looks alone. The gun must shoot well, and all that kind of thing, but at the same time, I want to pass my nail all over my gun, and if it catches any where, if it is not as polished and smooth as a statue, why that condemns the gun in my sight, and for my use.

Papilla.—I appreciate in every way your good judgment. Though you may be an exquisite in respect to your dress—your dogs, and horses and your arms, I must confess that you are a thorough master of the sportman's art, and there are not many men in the field, better shots than my friend Aries Virga. I must remark, however, that you are fortunate in having at your command means without limit. If I had your wealth, there is no doubt but that I would only be satisfied with a gun which would be a master piece of excellence and elegance. But you must remember that where you can spend a hundred dollars, I can only spend five. While your rational amusements cost you a thousand or so a year, I am forced to restrict mine to less than a hundred. Now in the United States, I do not suppose I am the singular exception in this respect; shooting here is essentially democratic and universal; I have no head game keeper, nor under keeper to see to my arms, and attend to an arsenal of guns. What is wanted here in the United States are serviceable plain and cheap breech-loading guns, without any great elegance about them. Of course I expect to shock you by the comparison, now, a washing machine—

Aries.—A washing machine! Why that is arch treason. What has such a thing as a washing machine to do with a gun?

Papilla.—I was only going to state that other countries, and other people, make other wants, and that just as cheap and good guns are required in the United States, and a demand has set in for them, exactly for the same reasons washing machines were invented and sold. It is only a question of supply and demand.

Aries.—Of course, I was waiting for that. You always must lug in political economy into subjects under discussion. But it is nonsense in talking of sportsmen to bring in washerwomen. There is an art, a mystery about the manufacture of a fowling piece, especially of a breech-loader. Why, even the names you see on English guns of the great makers, these people themselves do not know how a gun is made. It is the foreman of the shop who keeps the secrets. It comes down from father to son. Very few can fathom it. I am afraid friend Aries you are rushing in where angels fear to tread.

Papilla.—Bless me, Aries! I do declare you are fully imbued with that nonsensical idea, and speak of the mystery of the gun maker, in a whisper. I do acknowledge to make a good gun, for a modern breech loader, is much more difficult to construct properly than the muzzle-loader, requires no end of mechanical instinct, and inventive power, though men's hands and brains have advanced in cunning with the work required of them. Since you object to my washing machines, have you any disinclination to compare a gun with a watch?

Aries.—It is according to what you want to prove. Go on, however.

Papilla.—Is a gun a more delicate piece of mechanism than a watch?

Aries.—Why no!

Papilla.—Well then, if we can make good serviceable and cheap watches in the United States, not Frodshams, or Dents, or Jurgensens, precisely, but watches which answer every possible service, why can not we do the same thing for guns?

Aries.—But I would rather still have a Dent watch.

Papilla.—And so would I, but if I and you and fifty others men wanted to pay seventy-five guineas for an American watch, I have no doubt but that the watch-makers in the United States could produce watches for those figures, precisely as good as the the best English watches, and even as to style a trifle more elegant. In this 19th century, there can be no monopoly of manufactures.

Aries.—Well, is it just because people generally will not pay as much for an American gun as for an English gun, that English guns are better?

Papilla.—Not exactly, but that may have something to do with it. But my friend Aries, as I consider your judgment admirable as to guns, do tell me what you think is a good breech-loading gun?

Aries.—Well, what I fancy is wanted in a breech-loader, is a gun that will not rattle, and will withstand any amount of wear and tear, in or out of water, and which is safe. An arm not to be taken out on the back porch, to shoot a passing wood-cock with, but one which can be carried into the forests, or in the blinds or in the boat, and can be knocked about camp, and will bear all kinds of hard usage for months.

Papilla.—Will your fine guns do that?

Aries.—Certainly they will, and stand the work better than coarser made arms. I may differ from others, but I want a breech-loader, a gun where the barrels are fastened to the stock of the piece.

Papilla.—No tip ups?

Aries.—No, I don't want hinge pins, nor grips, nor eccentrics, nor fancy breech actions of any kind.

Papilla.—Are you describing a Snyder Allen then?

Aries.—Not exactly, mine is an ideal gun, for in the Snyder Allen the pin in the side box breech becomes loosened sometimes when you are not aware of it.

Papilla.—You then agree with the ordnance officers, who have all of them in the last five years, given the cold shoulder to all tip up or hinged arms?

Aries.—Lefauchaux made the first hinged breech-loading gun, and he has been I think too servilely copied. Ordnance officers are right about the arms adapted to their use, and I can't for the life of me see where the distinction can be drawn in regard to the mechanical principles between what makes an efficient military and a sporting-arm. The same system ought to work in both—because—

Papilla.—Bravo! now that is just where I have you. I thought your good judgment in regard to arms would have brought you to the subject of military arms. Now I put it to you, as a sane reasoning man, in the manufacture of good serviceable guns for our soldiers in the United States, with the Springfields, the Remingtons, the Sharps, the Ward Burton's, the Maynards, the Berdons, the whole rest of them, have we not arrived at very great perfection? These guns are all made like buttons, not by the gross, but by the thousands, one like another, like watches, or washing machines. You must acknowledge that. Well then what reason is there, why some of these manufacturers cannot produce honest, strong, safe and cheap breech-loading guns by the same wonderful mechanical resources which they have invented for turning out military weapons of the utmost precision?

Aries.—You can make an army gun in quantity, I suppose, but, nevertheless I must insist that fine guns are like Cremona violins, and are not turned out like buttons.

Papilla.—Most of the world is satisfied, and must remain so, with commoner musical instruments; it is only the grand masters, like Aries Virga, who can pay for their Cremona's,

PETRARCH.—*La Nature* tells us that in December last the mortal remains of Petrarch were exhumed for certain anthropological purposes. The great Italian's bones were found to be of an amber color, moist, and partly mouldered. The cranium, of medium size, was well preserved, and the frontal bone fully developed. The clothing was reduced to powder. From the size and length of the bones the divine poet must have been a man of middle height, and of robust constitution. Petrarch died in July, 1374, almost five hundred years ago.

and play on them. But you imported a very fine gun the other day, did it meet your expectations?

Aries.—Perfectly. It ought to have done so, as it cost not quite \$625 laid down here. It makes just the pattern I wanted.

Papilla.—Do you shoot then to a pattern? Oh! Alcibiades of guns!

Aries.—Of course I do. Men have so many different ideas about things. Of late years our own gun-smiths are paying attention to patterns I am pleased to say. I include all patterns under three categories. There is first the gun which shows on a thirty inch target a concentration of shot in the centre, the bulk of the shot going there, and with but few pellets on the outside; another gun makes the cullender pattern, where every square inch of the target has a shot or two in it; there is even a third pattern, where the pellets are thrown at five or six different points in the target in quantity, those centres having their occasional shots around them.

Papilla.—Which pattern do you prefer?

Aries.—It is according to what I want to use my gun for. The first gun I would take for geese, when I wanted to kill one bird certain. The second for snipe and flocks of birds, but the third gun I would like best for ducks. It may be the dilettanteism of sporting as to results, but it is perfectly possible to get guns to shoot in these ways, if you know where to buy your guns.

Papilla.—You are indeed worth listening to.

Aries.—Now I must confess, that all you have said to me about cheap guns may be true, but to return to your watch question. I suppose a machine can make the various parts, in fact the whole movement of a watch.

Papilla.—Certainly.

Aries.—Can a machine regulate a watch, adjust it? Find out the faults, the idiosyncracies of the time keeper?

Papilla.—Of course not, some skilled hand work is mostly necessary.

Aries.—Hand work has nothing to do with it friend Papilla. It is head work which comes into play here. When I pay \$500 for my English gun, I divide the bill as follows: Material twenty-five dollars, not more. That means cost of iron, steel and wood. Labor \$200, that includes all the barrel forging, boring, lock filings, brazing, wood-cutting, and more delicate finishing. Now something else comes in; the brains of the foreman of the shop, or of the maker of the gun, who has tried the gun may be one hundred times in altering the barrels or the bore a little every time he shoots my gun, until he gets it to throw the shot exactly to suit his fancy or mine—well, that portion of the expense, I put down at \$275, and I do not think I am paying a penny too much for it. Now when I say that I am perfectly willing to give a good round sum of money for my gun, I expect to pay for the time and skill employed in adjusting the gun, and I affirm that the best English makers do this work, when they are paid for it, and do it thoroughly and conscientiously. That is what I mean by the secrets of the trade.

Papilla.—You pay then for the experience of the gun maker. Well it as richly merits compensation as any thing else. In fact, Aries, I must confess there is a great deal of reason in what you say.

Aries.—I am forced too to allow that as to the feasibility of manufacturing good cheap breech-loaders at home, why what you have mentioned to me, when I think it over, leads me to suppose that it might be done.

Papilla.—Might be done? Why it is done to-day.

Aries.—Do you shoot with one of your breech-loading guns made by the gros sas you said?

Papilla.—Of course I do.

Aries.—And it satisfies your requirements?

Papilla.—Perfectly.

Aries.—And my English gun suits me. We are then both contented, and there can be no differences between us.

Papilla.—I suppose Achilles could not have fought as well unless he had had a silver bossed shield, a mirror for the Graces and a glaive of exquisite workmanship. When I have time I will look up my Homer.

Aries.—And the Spartans, who did wonderful slaughter with their more homely weapons?

Papilla.—*Charm a son gout.* That is it, aint it?

Aries.—Precisely, only that there was but a single Achilles who could afford to shoot with a \$600 breech-loading, whereas the general herd of Thracians, Lacedæmonians, Spartans and Greeks, generally had to use much cheaper guns when they went after their game.

Papilla.—I will excuse your classic anachronism.

THE EAGLE RIVER COUNTRY.

FOR FOREST AND STREAM.

THE Eagle River probably furnishes the best trout fishing of any river in Colorado. It is seldom visited, except by a few straggling miners and the Ute Indians. There is a trail leading up the valley of the river which runs from Tennessee Pass to one of the U. S. Ute agencies, but it is seldom used. During the past summer the head waters of the Eagle River was surveyed by Dr. F. V. Hayden's U. S. Geological Surveying party. We found it necessary to camp a few miles from the Holy Cross Mountain, as there was so much fallen timber we could not get a pack train over it, although repeated trials were made. Each time we were forced to turn our backs to the unconquerable fallen timber and loose rocks and return to camp with bruised and foot-sore animals. In fact there was scarcely a horse or mule in our outfit that was not the worse

for wear. Many of the men also suffered from hard knocks, and to add to our discomforts, it rained steadily for nearly two days. Finally a party was made up to ascend the Holy Cross Mountain at all hazards. Those who intended climbing the mountain selected the best animals in our herd, strapped a pair of blankets, poncho, and a few provisions behind their saddles, and set out for the mountain. When leaving camp they thought they could reach the mountain top in a single day, but when they had been out two days one of their party came to camp with a woe-be-gone look, and said, "Bill! have you got any bread baked?" Said Bill (our cook) soon emptied the mess boxes of their contents, and our delighted visitor left us with a full stomach, and some bread, a pail of baked beans, and a smiling countenance. That night he reached his famishing party, and there was a merry making at timber line on the mountain. They reached camp the next night, having completed their work on the mountain top. Our provisions were becoming low, so the writer and our hunter concluded to kill some game or catch some fish. I had heard several buck elk "whistle" on a mountain side near camp, so we concluded to try them first. We found many fresh trails, but the noise made by the bells of the "bell mares" and the shouting of the packers had scared away all the game. We returned to camp with a few grouse, (*Tetrao obscurus*,) determined to try our luck the next day in another quarter. Early the next morning we saddled our horses, took part of our bedding, some provisions, some dry tea, (we were out of sugar,) a piece of bacon, some bread, two tin cups, and a large stout iron gray pack horse, which we promised to load with meat, fish or fowl. After leaving camp we descended a steep hill, about two miles from our starting point, and having made our way through numerous beaver dams, camped in among some huge boulders, which entirely concealed ourselves and animals from the outer world. When searching for a place to camp we started two deer and a bear. We only heard them break cover, but after hunting up their trails, found we had frightened away two does and one grizzly bear. When our animals were picketed, we made a fire, and then built a shelter tent with our rubber ponchos and a blanket. By the time our tent was completed the fire had "burned up," so we poked out some coals and brewed our tea over them in the tin cups. A few pieces of bacon were frizzled over some sharp sticks, which were eaten with bread, and with our tea we had a fine lunch. The sun was then getting low and my "pardner" remarked "it is time the deer were coming down from the hills to drink, and we may as well get ready to meet them." We repicketed our horses so that they might have better feeding, and taking our rifles, (a Ballard and Sharpe,) we separated, and set out on a still hunt. My companion followed up the West Fork of the Eagle River, while I went down the main river to watch a lick. It was sometime after dark when we reached camp. When reaching it I replied, "What luck?" "Didn't see a hoof." "Neither did I." "This will never do," said my companion. "We must try the trout in the river as soon as the sun brings out the grasshoppers in the morning." After supper we turned in. At daybreak, the next morning, we made bedding, &c. in a pack, which was handed over to "old gray" for transportation. In two hours we reached the fishing ground. When our animals were attended to and our "traps" made snug, we armed ourselves with spruce branches from a neighboring tree and commenced a raid on the grasshoppers. As fast as they were captured we put them in an old rubber coat sleeve, tied up at one end with a string, from the leggings of my companion. We soon had all the bait we wanted, and with our willow poles, landed eighty-five pounds of trout in three hours. The water of the Eagle River is remarkably clear, and the large trout can be easily seen before taking the hook. At the point where we were fishing the river is not over ten yards wide, although it is very deep in many places. I landed thirteen large fish on a small boulder in the river, and could have easily caught others if our hungry men had not been awaiting us at camp, which was a long way from our fishing ground. The trout caught were large, light-colored, and regularly spotted, but only half way up the body from the tail. They proved to be excellent eating, and the flesh of some of the larger ones was the color of that of the salmon, when cooked. We reached camp in the afternoon, and our artist, Mr. H——, made a fine drawing of a group of our largest fish, which were arranged on a manta.

J. H. B., U. S. G. Survey.

DR. HAYDEN, in charge.

For Forest and Stream.

RIFLE SHOOTING IN THE OLDEN TIME AND IN THE PRESENT DAY—CREEDMOOR—ACCURATE SHOOTING, &c.

THE writer of this can remember very well when percussion caps and cartridges were unknown and flint locks alone were used on rifles and shot guns, and many a day has he followed his father and his uncle, who were famous shots and mighty hunters in their day, in the backwoods of Ohio and Virginia in quest of deer, turkey, coon, squirrels, and ruffed grouse. He has been at western shooting matches and hunts, and chased the red fox with old men who can remember the Clarks, Lewis's, Pae's, Kentons, and Doddridges of the valley of the Ohio. He has sat by the cabin fires and heard the old trappers tell their stories of "hairbreadth 'scapes by flood and field," of bear fights, contests with Indians, and wonderful and fatal shots at long distances; but he is satisfied that if these festive old sports could break the ceremonies of their humble tombs, and issue forth with their long shooting irons,

stockless, and with the obsolete flint locks, they would be as much amazed as was Irving's renowned hero of the Catskills when he gathered up the remains of his old musket. They never dreamed that rifle shooting could be brought to the perfection it has now attained—hitting a turkey at two hundred yards, or a deer at three hundred, was an event to be talked about for a lifetime. We have known famous old rifles named "Old Betsy," "Honest Lige," "Truthful Reuben," &c. All of them had a marvellous history. In this day, however, they would be worthless except for old iron. If the old rifle shooters could have lived to see a Creedmoor or a Wimbledon, they would feel as far behind the age in which they hunted and shot as the man who had been used only to country wagons and came suddenly upon a train of cars at full speed.

That rifle shooting is destined to become a great national sport in America there can be but little doubt, and when the desire to excel and improve begins to take hold of the vigorous and sport-loving people of the west and south we will see a great demand for the best guns and shooting apparatus that can be made. Amateur rifle clubs will be formed in every county throughout the forty States and Territories of the Union. Literature concerning marksmanship, the "butts," the FOREST AND STREAM, will be in demand. Grand national and State tournaments will be inaugurated, and thousands of competitors will in time annually contest for superiority, and away yonder in the not very distant future we think we see the victorious American "team" issuing forth with the championship of the world on their banners.

Without disparaging the great achievements of the representatives of other nationalities, or making any invidious comparisons, we think we may be allowed to indulge in a little egotism, and possibly "to brag," to some extent, about what we have done on this side of the water, considering we have not yet turned the corner of the first century. We have made advances in the sciences, arts, agriculture, and gunnery, and wherever there has been a demand or a need for men, women, children, or things, they have been forthcoming. It would be strange, then, if we could not produce rifle shooters who shall compete with the best on the planet.

Steamboats were needed to navigate our vast rivers—Fulton invented them. Lightning communication was called for, and Professor Morse put up the wires. A fast sailing yacht was required, and Steers made the "America." A trotter was wanted, and Flying Dutchman did three miles in 7:32, and then came Dexter, who brought the time of the Dutchman, which was 2:30 2-3 to the mile, to 2:17½, eclipsing the world. A racehorse of endurance and speed was needed, and that mighty equine hero, the blind stallion now at Woodburn, Kentucky, appeared in 1855 and ran four miles in 7:19½, which has never yet been equalled. When the chess world became excited Paul Morphy was brought to the surface. He sailed for Europe, and after singly defeating the champions of the Old World he played five games against twenty-five of the best players that could be produced, on five different boards, blindfolded, and won the majority of the games. He then challenged Staunton, the great Englishman, who intimated that he would only play for a stake, and when Morphy was directed by his friends in New Orleans to offer to play for \$50,000 a side, or any larger amount that might be agreeable, Mr. Staunton declined.

We have some very big things here besides men and women. We have extensive rivers and lakes, mountains and valleys, vast trees and high falls, and now we are called upon to produce eight marksmen who are to compete with those vigorous and intelligent sons of Erin who bore off the celebrated Elcho Shield from the English and Scotch shooters at Wimbledon. We can but try, and while it will be dollars to cents that the gallant Celts will return to the "ould sod" after their match here as victors, still we have every confidence that we have the material here to make the champion shots of the world. At short range shooting, deliberate aim or at the word, or at three-quarter inch suspended bullets, the gallery of Mr. Conlin has produced the most remarkable marksmen the world has yet seen. The shooting of Captains Travers and Paul has been surpassed and thrown quite in the shade. For example, Mr. William Hayes made 175 consecutive bulls eyes at seventy-five feet. Mr. Hamilton, at the same distance, made 354 bulls eyes out of 359 shots; 155 consecutive. He made also forty-five consecutive bulls eyes at the "word one," which is the best ever made at the "word." He also made forty-one bulls eyes out of forty-five shots, the other four shots measuring one and one half inches, string measure; besides this, he hit the one and one half inch bulls eye five consecutive shots at the word "one." We shall send you an article upon the requisites, as we understand them, for a good rifleman, rifle shooting in its anatomical aspect, and also some hints upon preparation and training for a match.

OLD SHOT.

—A New Haven editor spent last Sunday in Slawson, and attended church. When the contribution box came around he was in a doze, but on being nudged, hastily explained, "I have a pass."—*Danbury News.*

—"That dog of yours flew at me this morning and bit me on the leg, and I notify you that I intend to shoot it the first time I see it."

"The dog is not mad."

"Mad! I know he's not mad. What has he got to be mad about? It's me that's mad."

—What is the difference between a loaf o' bread and a loafer horn? One rises in the dough; the other dozes in the rye.

Woodland, Lawn and Garden.

WINDOW OR PARLOR GARDENING.

NUMBER V.

"When the flowers and trees are waving,
Birds will sing their sweetest song;
Where the purest thought will linger,
Confidence and love belong.

Such a home makes man the better;
Sweet and lasting its control—
Home, with pure and bright surroundings
Leaves the impress on the soul.

IN this paper we will attempt to give our readers some more advanced and elaborate plans for the adornment of our parlor recess and bay windows. We will suppose, however, all our readers, and more especially our lady readers, have become quite well acquainted with the foregoing suggestions upon parlor plant growing in their most practical forms. First, they have learned from the single specimen of plant growing in one pot how richly a little care and patience is repaid, as illustrated by a single rose geranium, grown high up amid the damp fog of "Coiner's Court," and the magnificent unfoldings of the rose tree in our humble rural home. Next, we passed in review the first effort of the tyro in growing flowers in a common parlor or sitting room window of some half dozen common plants ranged upon a common shelf. We endeavored to show in our simple illustrations of plant life how easily apparent difficulties could be overcome, when one readily and resolutely set about doing the same. We endeavored to show our many lady readers, and others interested in this delightful occupation, how easily even the poorest rustic home could be made fresh and beautiful, and to literally blossom like the rose, even in the severity of mid-winter. We have taught the wild flowering jessamine of the tropics to throw its fragrant sweets, its rich perfume in these, our northern homes. Now we can rejoice in cheerful gladness, even at this time, this frosty season of the year, amid all the floral beauties of many climes.

And how have we been able to accomplish all this? By attending to a few well known, practical suggestions, that in all cases will give a like rich reward. We found that our box in the window, fitted to a shelf of some larger dimensions gave us our first idea of a window garden in its most simple form. This box we filled with carefully selected plants, well adapted to the situations in which they were to grow, after having given the necessary soils, their chemical union, and component elements.

In our more advanced conversations, after noting the simpler elements, a knowledge of which is always necessary to success in any undertaking, we noted the more elaborate, or what might be called the initiative, of composition element in window gardening, under the forms of the zinc pan, and the culture of bulbs.

In the progress of our third paper we gave some idea of the management of the different bulbs, the simpler forms of the ferns, the introduction of the cacti, and the mixing of the different kinds of bulbous plants together. We spoke of the fine effects that we had produced by the grouping of the New Zealand plants with those imported from Australia and California. We gave the simple forms, or what we called foundation rules, for the construction of small crags or miniature rock work within the window. In our fourth and last paper a recapitulation or analysis of all which we deem necessary to a better understanding of our present paper was given.

In this article we present to you for consideration the first part of a full window garden of rare and fine plants, intermingled in a more natural and pleasing form. As Shakespeare has truthfully written—

"This is an art which does mend Nature—
Changes it rather, but the art is Nature."

You can, if you have a large sized bow window, have a box constructed to rest upon short legs, with rollers attached, by which means it may be removed back and forth to the window, as may be desirable. This box may be one and a half feet in height, and of such width as will allow it to just fit in evenly with the outside coverings of the window. We suppose the depth of this bow window to be three feet and six inches in width. This will allow us to have a box made say twenty-one inches, or one half the width of our window, and allow sufficient space to place on the sill of the same, another box of like dimensions and measurement, if we choose so to do; but our plan has been to have the upper box on the one which rests upon the shelf upon the sill of the window ten inches in depth instead of a greater depth, this size being found upon use as best adapted to the growth of the plants we place within the same. Having filled our smaller sized box, according to previous direction with earth, adapted to the growth of the plants designed to be grown in the same, you will proceed to plant them, varying them in arrangement to suit your own fancy somewhat, being careful always to place all of one species together, care also being had as to the soils best adapted to this arrangement of plants. If you would like to try as an experiment the cacti, of different species, an arrangement like the following will give you much pleasure (we have succeeded with such an arrangement), and we think you will not fail if careful not to overdo your plants. There is such a thing as over-nursing, or taking too good care of a plant, and the cacti of some species are very impatient, and by their appearance say to

you more plainly, perhaps, than any other plant, "Let me alone." They shrink from too much water, and will live and thrive and send out huge clusters and long plumed blossoms from a very dry base. Being a Mexican plant, having their origin among hot, arid soils of rocky, silicious formations, their very nature is of course different to many other plants, a fact to be kept always in mind.

I have placed a narrow, long box, say four inches wide and five inches in depth, on the top of the upper box, well filled with coarse gravelly sand and pieces of brick of the size of a walnut and less, to within three inches of the top; you will then select your cacti plants from the best catalogue you may deem best. They succeed best in sandy loam, and this, mixed with brick and lime rubbish, a little peat and rotted manure, should fill up your cactus box. The tallest and more rapidly growing plants should be placed nearest the ends of the box, filling up the centre space with the smaller kinds. The drooping kind may be planted at the front side, or sides of the box next the room, and form a pretty appearance hanging over the front of the box, which may be painted of any color, and they add much to the general effect. Of the plants denominated succulent, the aloe and cactus seem, by their very nature, adapted to very dry climates, and enter into parlor gardening very naturally, and are easily taken care of. Like many other plants in some respects, they are in others very unlike. There is no plant that we have ever cultivated as an indoor plant that requires less care than this curious plant. I have, as a general thing, let it take care of itself, after carefully preparing its receptacle of earth for it. It should be kept quite dry, except when growing, when it should be watered freely. These unique plants will repay all your attention. They are designed by nature to endure a recess from moisture, their organization fits them peculiarly for it, and they are of a flat, fleshy texture, covered with a thick, tough, leather-like coat or bark, which does not respire so freely as other plants.

You can procure from the florist all the best known varieties of cactus, many of the older varieties being far preferable to the newer crosses. Among your selected plants you may place *Jacksonii*, *Mabsonia*, and *Ackermanii*. The *Opuntia microdas* has beautiful foliage, and, being tufted over with regular rows of yellow spires, is truly worth all the time and patience bestowed upon it. With these few named plants you may fill your narrow box, and leave them to take care of themselves while you next give your attention to your second box, which rests upon the window sill.

With the previous suggestions given, you will be prepared somewhat to enter upon your work with a good degree of confidence, and in arranging the plants in your second box you will be quite particular to observe the following rules, which will prevent many incongruities in the grouping of the different plants. Avoid placing rose color next to scarlet, orange, or violet; never place orange next to yellow, or blue next to violet. Orange will harmonize well with blue, and yellow with violet. Rose color and purple may be placed side by side, and the effect is harmonious. You now have the white, with which to relieve any color, but it is never to be placed next to yellow.

Having brought our lady friends thus far in our attempts to make our parlors and sitting rooms sources of pleasure during the winter months, we would remark that while we could easily designate by name every plant to be used for the filling of our second box (and which we shall do in the course of these papers), we deem it more for the interest of our readers to try these experiments to a certain extent, unaided by more minute directions from us.

In our next we will give a continuation of the manner of our own planting—Box No. II.—and other and more interesting matter relative to the subject of parlor decoration.

OLLIPOD QUILL.

A BIT OF NATURE IN THE PARLOR—While in Jacksonville, Florida, we saw something so pretty, and in such good taste that we will try to describe it, and perhaps some of our northern ladies may avail themselves of the idea, which may be developed in many ways. In a shadowy corner of the room a shelf was covered with a large quantity of various kinds of dried native grasses, over which the beautiful Spanish moss of Florida was hanging in festoons from short branches until it almost touched the tops or mingled with the grasses. Within it looked as dreamy and as dark as the recesses of the swamps and forests. Just among the grasses, and half concealed by the hanging moss, stood a beautiful, small, snow white heron, nicely and perfectly stuffed, and looking remarkably life-like. He seemed to be standing in his native marsh, and his attitude was as if he had just spied the observer, and startled by the intrusion, was about to take flight. The poise of the head and the wild glance of the eye were perfect. The illusion was complete, and the whole formed one of the most tasteful and beautiful decorations for a parlor we have ever seen.

—The efforts now being made in Colorado for the preservation of the timber are of the most praiseworthy kind. Mining interests are suffering from the wanton destruction of the timber. The Governor attributes this wanton waste either to the recklessness or maliciousness of parties by whom entire districts of timber are fired and destroyed, and advocates stringent measures more severe than those already existing, and that a standing reward be offered for the apprehension all who violate the law in this particular.

Natural History.

THE WHITE-TAILED PTARMIGAN.—*Lagopus leucurus*.

EDITOR FOREST AND STREAM:—

The *Lagopus leucurus* is the smallest of its genus, and inhabits the highest ranges of the Rocky Mountains. It was first taken by Douglas and presented to the Zoological Society of London. Since then specimens of it have been taken by the U. S. Expeditions, and during the last summer I collected several adults and one young chick while in the Sierra Madre Mountains with the U. S. Geological Survey under Dr. F. V. Hayden. The White tailed Ptarmigan is the only one of its family that is found in the Southern Rocky Mountains. During the summer months they are found in pairs near the snow banks on the bare tops of the mountains. Their nests I have seen on several occasions, all of which had been deserted by the young. They are generally placed in some little cavity among the loose rocks, and are constructed of dried grasses. The nests are small in proportion to those of the different species of grouse, and scantily built. In fact they select just such places for their nest in the rocks of the mountains as the *Uria grylle* (black guillemot) would on the rocky islands of the Atlantic ocean. I do not think the *Lagopus leucurus* ever has more than three or four young at a brood, as I have seen pairs of old birds with their young on several occasions, and at such times have never observed more than four chicks in a family. It is barely possible that their numbers may have been lessened by being devoured by hawks or by the cold rains, which may have chilled and killed them. It is a well known fact to most Naturalists that large numbers of the young ruffed grouse often perish from exposure during late springs accompanied by cold rains. I have several times found them dead and in a dying state, caused by exposure in the woods near Springfield, Mass. I do not think that is the case with the young Ptarmigans, however, as they are hatched late in the season, and last spring was a favorable one for their propagation. Neither do I think they are destroyed by hawks, as there are none where the Ptarmigans breed, with the exception of a few straggling sparrow hawks, which are rarely seen. Therefore I think the *Lagopus leucurus* has but three or four eggs at a sitting, and but one brood in a season. They have a continued moult which lasts during the summer months and the variation in their plumage is so great that it is almost impossible to find two individuals in the same plumage. During the months from April to September their plumage is very scant and ragged; but when in their full winter plumage their feathers are heavy and compact, which gives them a much larger appearance than when seen in the summer dress, mottled with brown, and grayish white. The tail at all times is pure white. They are generally known in Colorado as White and Mountain Quails by the hunters, miners and ranchmen. When with their young they will fight the ornithological robber, flying so near as to hit one with their wings, in their endeavor to protect their chickens. Both male and female are equally courageous, and will defend their young. In the summer they are very tame, and when approached will run among the rocks or in the dwarf willows, a few yards from the hunter, and squat and will not continue their retreat until the hunter is upon them. When raised they fly in a straight line for seventy-five or a hundred yards, and alight on some elevated rock, stretching out the neck its full length to see if they are followed, and if nothing is seen to excite their suspicion they walk off from the rocks and commence to feed as usual. During deep snows in the winter the Ptarmigan descend from the mountains and feed in the edges of the timber and on the hill sides. Last winter some were seen as far east as South Park, Colorado, feeding on the foothills. They are gregarious in winter. The White-tailed Ptarmigan is 26.25 inches in extent and 14.50 inches long; eye, hazel; supercilary membrane, red; toes, feathered half their length in summer, and are entirely covered with hair-like feathers in the winter; claws, blackish—lighter at their tips, long, broad and strong, rounded above, concave beneath, arched, edges sharp, and in some individuals the claws are notched on the sides.

Jos. H. BATTY, U. S. G. Survey.

(Dr. F. V. Hayden in charge.)

"DO QUAIL VOLUNTARILY RETAIN THEIR SCENT."

EDITOR FOREST AND STREAM:—

It has long been a question of argument whether the *ortyx Virginianus*, or quail, can retain its scent or not at its pleasure. Certainly every sportsman has noticed, after having flushed a covey, and marked it down and scattered it in some open grass field or tussock meadow, how much more difficult it is to restart the single birds than he expected, in fact how totally at fault his dogs appear to be notwithstanding their reliability and superiority, and only until almost trodden upon will the quail whirr from under his feet or the setter's nose.

I am satisfied they give out no scent at this time, but by no means convinced they possess the power of retaining it as some argue, for when the frightened covey is started, and having been shot at, in their haste to flee from danger they pitch directly into a spot and alight without running afterwards, into the smallest space possible in order to hide, and their feathers are pressed closely against the body from which the scent proceeds, and none for a time tells the tale to the pointer and setter.

Not until the bird has moved can he be pointed, and the sportsman having shot at the flushed covey, goes directly where he has marked them down, which occupies but little time, and he wastes much labor in tramping them up; if on the contrary he waits ten or fifteen minutes quietly, and the quail have gotten over their fright, and move a little, he will most certainly have his dog point them singly.

While resting on the side of a field the past November, I noticed a quail under full headway, pursued by a hawk, pitch into a growth of high grass bordering a small pond, and escape, while the hawk disappointed in his first chase began a search in the grass, trusting to his sharp eye to find his prey. Knowing exactly to a foot where the quail alighted, but with the intention of killing the hawk, I crept to the pond and shot the robber down, and then called my dog for the purpose of seeing if he could point the quail.

I saw it crouched closely to the ground, and in no direction could get a stand from my dog, noted for his superior nose. I called him off and patiently waited for the bird to move, and could distinctly see its movements, if any were made. After a lapse of a few minutes the bird turned over as if to change its position, still hugging the ground in its fright. I then moved towards it with "Grouse," and he stood staunchly.

I would like the opinion of some of your correspondents as to this question.

"Homo."

X AS TO PORCUPINES.

NEW YORK, January 19, 1874.

EDITOR FOREST AND STREAM:

An article in your columns of January 8th, 1874, in relation to porcupines, suggests to me this communication, which I hope will help to correct the erroneous idea, but very general one, (even among those who reside in the parts of the country where these animals are plentiful), that the porcupine shoots its quills. By experiments I have not only completely satisfied myself that they do not "shoot" or "throw" their quills, but also that they can at will strike with their offensive and defensive weapon, the tail, without leaving quills in the object struck. My experiments were made with the animal known in New England as the "hedge hog," the quills of which vary from one quarter inch to four inches in length.

An account of the capture of one alive may be of interest. At Conway, N. H., in the latter part of a summer afternoon, I was driving down

The Horse and the Course.

—A purse of \$10,000 will be given to be trotted for, mile heats, best three in five, in harness, over the Mystic Park, Medford, Mass., near Boston, open to all the stallions in the United States and Canadas, the winning horse to receive \$4,000, the second horse \$3,000, the third \$2,000 and the fourth \$1,000. Each stallion winning a premium will also receive a gold medal. The race to come off on Tuesday, September 15.

—George Barbee will ride for Mr. P. Lorillard during the coming racing season.

—The second annual running meeting of the Utica Park Association, is to be held on June 24, 25 and 26. Two stakes are now open to be run for, these are the Ladies' Stakes, for two-year olds, entrance \$30, half forfeit, with \$300 gold added by the association; the second horse to save his entrance; one mile; and the Oneida Stakes, for three-year olds, entrance \$50, half forfeit, with \$500 added; the second horse to save his entrance; mile heats; to carry 100 lbs.; the stakes to close on the 31st inst.

—The Savannah Jockey Club have received the following list of entries for the Ten Broeck Stake, to be run February 3, 1874, which is for three-year olds; colts to carry 85 lbs.; 3 lbs. allowed for fillies and geldings; one mile:—A. B. Lewis & Co.'s ch. f. Belle of Australia, and br. f. Vandelite; T. G. Bacon & Co.'s b. c. Father Ryan, and ch. f. Flower Girl; L. A. Hitchcock's br. f. Boone, and D. O'Connor's ch. f. Fannie.

—The American Jockey Club have the following stakes open for nominations, to close on the 1st of March, to be run at the coming spring meeting:—The Juvenile Stakes, for two-year olds, half a mile; the Fordham Handicap Sweepstakes, one mile and a quarter; the Jockey Club Handicap Sweepstakes, two miles, and the Westchester Cup, two miles and a quarter.

—The San Francisco *Chronicle* of January 8 says that in the Assembly Mr. Wickware introduced an act to authorize the closing of certain streets in San Francisco for the purpose of an agricultural and mechanical fair ground and for a race track. It is understood that an association has leased the ground from the owners, and that the Board of Supervisors is willing to grant the right to fence in the streets. The race track is to be a mile. Opposition to the act is anticipated from parties interested in other tracks in the neighborhood of San Francisco.

THE RACES AT MAURITIUS.

IN the upper part of the Champ de Mars, a large, treeless grassy plain, believed once to have been a large crater, stands a stone monument twenty feet high, erected to the memory of one of the French governors. At the foot of the plain the Mauritius Cricket Club has erected a pretty pavilion and laid out a square cricket ground. On this spot is held, generally in July, the Mauritian Carnival; for round the Champ de Mars runs the racecourse, kept in excellent order by the Mauritian Turf Club, to which glorious institution (dating from 1812) the colonists, rich and poor, white and colored, male and female, young and old, owe three days of blissful madness.

Not only the race ground itself, but the whole city, rises to a fever heat of enthusiasm as the first day dawns. Every street is crowded with chairs, tables, benches, and stands. Private carriages are driven up and left horseless within the cordon. Tents rise with magic rapidity on the surrounding eminences, flags fly, and tomtoms beat. The judges' stand is flanked by long rows of stalls or lodges for the more select spectators, such as the governor (over which proudly floats the royal standard), mayor, council, military officers, &c.; and here the beauty and fashion of Port Louis, in glittering array of jewels, gauze, and silks, win or lose gloves as recklessly as at Ascot or Longchamps. Drawn up beneath the stalls are vehicles of every description which will meet a certain standard of presentability, and in them sit other ladies in equally magnificent attire; but if a resplendent dress, surmounted by a Parisian bonnet whose fluttering laces are coquettishly arranged by a tiny white-gloved hand, should tempt the curious bystander to look for a face of equal delicacy, a pair of bright black eyes will flash upon him from beneath "a brow of Egypt," in which his unacclimatized European taste may not lead him to discern "Helen's beauty," though the possessor will have probably tried to tone down its lustre by a liberal allowance of violet powder.

Racing is of course the *raison-d'être* of races; but a great charm and zest lies in their concomitants also, and perhaps the less said about the horses and jockeys of the Champs de Mars the better for their English reputation. The Mauritian Newmarket is "good for trade," and excuses a general holiday, therefore may its shadow never grow less!—*Saint James' Magazine*.

WILD HORSES IN KANSAS.—From the Topeka *Commonwealth* we take the following:

Large numbers of wild horses abound on the prairies between the Arkansas and Smoky Hill Rivers. They are of all sizes and colors, and are the wildest of all wild animals. They usually roam in bands from six to twenty, and will run at sight of a man two miles away. A great many domesticated horses, as well as mules, which have strayed away from their owners, have taken up with the wild ones. After running with them awhile they become as wild as their untamed companions. Various methods have been adopted to catch them, but they have generally proved fruitless. A scrubby colt or a broken-down mule are, as a general thing, the only reward for all the time and labor. Settlers on the frontier would hail their speedy extinction as a blessing, for when domestic animals get with them their recovery is simply out of the question.

This is interesting as tending to show, how domestic animals will, when opportunity allows, return to their primitive natural condition.

Answers To Correspondents.

[We shall endeavor in this department to impart and hope to receive such information as may be of service to amateur and professional sportsmen. We will cheerfully answer all reasonable questions that fall within the scope of this paper, designating localities for good hunting, fishing, and trapping, and giving advice and instructions as to outfits, implements, routes, distances, seasons, expenses, remedies, traits, species governing rules, etc. All branches of the sportsman's craft will receive attention. Anonymous Communications not Noticed.]

Quon.—To clean rusty guns use kerosene oil. To keep it clean nothing is better than skunk's oil.

J. E. L.—Don't recollect what old "Grizzly" Adams' bear weighed. Jim Conlin of the Broadway Shooting Gallery, or Mr. Daymon, Tiffany & Co., might know. Both have been with P. T. Barnum.

W. P., Clinton street, Brooklyn.—What treatment would you advise for a Newfoundland dog with the following symptoms: Loss of appetite, very weak legs and bleeding at the nose? Ans. You must state age; most likely the dog has caught a severe cold.

H. C. S., Ohio.—Is a pigeon sprung from a trap harder or more difficult to hit than a quail in field. I am green as to pigeon shooting, having never shot any except wild ones? Ans. It is more difficult to kill a quail, as it is impossible to tell when and which way the bird will get up.

J. T. E., New York.—I have a setter puppy two months old. Is it time to cut his tail? Ans. Don't cut his tail at all; leave it as nature provided. What is the best kind of food for my puppy? Ans. His mother's; also feed him with weak milk and water mixed with meal, but very weak.

W. L. S., Amherst, Iowa.—Which is the strongest, laminated steel or good twist barrels (same weight)? Ans. Both shot barrels have their admirers. For all practical purposes laminated steel barrels answer the requirements of the sportsman. We can give you the statistical proofs of both kinds if necessary.

R. H. A., Parkersburg, Va.—Among your book reviews I notice "The Birds of North America," by Theo. Jasper. How many parts are there to be, and how many pages to each part? Is each part bound separately? Is it quarto or octavo? Ans. Thirty-six parts, twelve pages, each 12x15 inches, one dollar each part, delivered monthly to subscribers only. If you wish a book from which to study the fauna of North America, better buy Coues' "Key to the Birds of North America."

***—THE FOREST AND STREAM will be indexed each six months, and twenty-six numbers will constitute a volume. 2. Split bamboo for fishing rods is the common bamboo sawed into longitudinal strips of requisite dimensions and the pith removed. When the several parts are prepared, they are adjusted together with the utmost mechanical nicety, giving elasticity, strength and durability, which ordinary bamboo does not possess.

H. BANBER, Brooklyn.—Rifle practice is a dangerous business in populous places. It would be difficult to find any part of the suburbs of Brooklyn, no matter how thinly settled, where rifle shooting would not be liable to cause the arrest of the offender, and very justly, too. If you shoot on the beach, seaward, the case is different, and the practice perfectly safe where no boats are in view.

C. L. W., Weston.—1st. What is the calibre of my gun, judging by the enclosed wad? Ans. 14 bore. 2d. What is the method of measuring the charge, both of powder and shot? Ans. By a gauge, which you can purchase at any gunsmiths. 3d. Is the principle of choke boring adopted in the manufacture of breech-loading guns? Ans. You can have a gun barrel bored to suit almost any pattern you fancy. See article headed "Guns—a Dialogue."

J. E. W., Newbern.—The Julia mentioned in the article by E. M. was a large sloop of some seventy feet over all and belonged to Capt. Waterbury. She was in her prime from 1858 to 1861, and was so fast as to be often ruled out of matches when other sloops, such as the Rebecca, Rowena, Mallory, Bonita and others were to be competitors. She was afterwards changed to a schooner, and the last time we saw her was in 1871, at which time she was cruising in Narragansett Bay, where she was owned. We know your Julia to be a good one, but she is not the Julia mentioned.

W. ELLINGWOOD AND OTHERS, New York.—

1 lb. avoirdupois weight is 7,000 grains.
1 lb. apothecary " " 5,760 grains.
1 lb. Troy " " 5,760 grains.
1 oz. avoirdupois " " 437½ grains.
1 oz. apothecary " " 480 grains.
1 oz. Troy " " 480 grains.
1 drachm avoirdupois is 1-16 of 437½ grains, a little less than 27½ grains.
1 drachm apothecary is ¼ of 480 grains, or 60 grains.
Much obliged. Shall be glad to hear from C. E. again.

F. E. E., New York.—Can you inform me of the pulsations of the domestic and wild animals? Ans. After a great deal of trouble and search we found it. Vatel's Veterinary Pathology:

	32 to 38 Pulsations in a minute.
The Horse.....	32 to 38
The Ox or Cow.....	35 to 42
The Sheep.....	70 to 76
The Goat.....	72 to 79
The Cat.....	110 to 120
The Hare.....	120
The Dog.....	90 to 100
The Crow.....	136
The Duck.....	136
The Hen.....	140
The Heron.....	200

F. W. C., Paterson.—1st. Have you got the right to fish and shoot on your own land at any time, in season and out of season? Ans. We believe you have the right to do anything you please with your own property. 2d. What is an "Ely's Concentrator," and what is meant by pattern, as applied to shot guns, or rather to the way they throw shot? Ans. See to-day's issue, article headed "Guns—a Dialogue." 3d. What can you import me a rabbit beagle for. I should want a puppy about two months old. How long would it take to get it here; what kennel would it be from? Ans. A rabbit beagle should be at least 6 months old, and would cost \$20—English. 4th. Is there any breed of dogs that are good to hunt rabbits and make good house dogs of; a hound lying around 9 months in the year eating his head off is somewhat of a bore? Ans. The Dandie Dinmont Terrier.

HATMAKER, Clyde, N. Y.—To any one crossing the line into Canada, what is the arrangement with the Custom House officers about guns, boats, and other necessary articles of a sportsman's outfit? Ans. We have always found the Custom House officials very obliging and quite ready to pass a sportsman's baggage without examination, when they were assured of his identity. In one instance only (it was about the time of the Fenian raid) we knew of a gentleman who had some trouble with a gun. These worthies have little difficulty in detecting suspicious persons. 2. Is there any duty on game or furs brought from either country or sent? Yes of game; except what you carry on your person, and as to furs the law is very strict. 3. Is it necessary to have "hard money" or can we pay for whatever we want in our currency? Ans. Greenbacks pass at market rates in all hotels and stores in cities, but in the rural districts Canadian money is necessary, and among the French people nothing is current but silver. You can supply yourself at any brokers on either side the line. 3. I am fully aware that it would not pay to transport boats any great distance, but we are so situated that the principal part of the transportation would be on the steamer, for instance from Oswego to Cobourg, and have an idea that we could take them cheaper than buy them in Canada? Ans. Note our advertisement and write to Bond, of Cincinnati, for circular as to portable boats. You can pack your traps in these and they will go as trunks.

the "Swift River Road," on my return to the hospitable care of friend Eastman of the "Conway House," and when but little more than a mile from the hotel, although not out of the woods, a porcupine crossed the road about thirty rods before me. I immediately quickened the speed of my horse, stopped, and leaped out in time to kick the porcupine from a tree which he was climbing, and he would have been far beyond my reach had he known of my pursuit a moment sooner. Porky once again on the ground, I succeeded, with the aid of a dead branch which I picked up from among the many lying under the pine trees, in preventing him from starting up another tree, and drove him to the road, when to my dismay he ran under the horse; but the well trained steed gave but one jump and at my command went no further, but was trembling very much, and Mr. Quillbearer having come to bay under the wagon, standing erect on his hind legs in the manner of bears, I took this opportunity to coax and soothe the horse for a moment; then quietly getting a bit of rope from the wagon, and making a slip-noose, the porcupine still on his hind legs awaiting my next movement, I went to the horse's head and started him a few paces. The instant the porky was left behind the wagon he started for the trees again, but being fat and his legs short, I easily headed him off, and threw the noose over his head, dragged and lifted him into the rear of the wagon, where I bound him, and then proceeded to extract about fifty quills from the fetlocks and ankles of my horse, which was an operation I would not wish to attempt on any other horse (standing in the road and trembling with fright) than my own.

Porky rested in a barrel for several days, but I succeeded in attaching to him a collar and chain, which gave him comparative freedom. When he was out of the barrel, I attempted to touch his head with a stick but it would be met by a blow from his tail; but when in the barrel he could not turn quick enough to strike; and with a round stick of soft wood, an inch in diameter, I drew many of the longer quills from his back with a touch so slight that I depended upon my eyes and not my sense of feeling to know the moment of contact. The animal being less than two years old, soon lost some of his wildness, and I was able to touch him with a stick (I did not try with my hand) without resentment on his part, except when I was too violent, or in the presence of a dog. In such cases he would strike the stick, but instead of it being bristling with quills after a blow, there would be but two or three or none at all in the stick.

From the points of the quills, which are as sharp as needles, for a quarter of an inch toward the base are minute barbs, which serve not only to retain the quills in the object struck, but when such object be a living creature, if the quills be not immediately extracted, the barbs will serve to draw them deeper into the flesh, where they will travel about, as will needles under similar circumstances, but the quills move rapidly. I have seen a fine hound which with more courage than prudence had attacked a porcupine, to the severe punishment of the dog, whose head and mouth were badly punctured. Every quill which could be discovered in the dog was extracted, but several weeks after the return from the hunt a quill was extracted from the ridge of his nose, about two inches from the forehead, which had entered the roof of the mouth and thence worked through the cartilage above. After explaining to which species of porcupine my article refers, I have ignored the local name "Hedgehog," and in this connection wish to urge your readers, most especially sportsmen and correspondents, to apply the naturalists' names to creatures, and not local names, which vary in different sections of the country and are very often misnomers. Most of the names in this country are adapted from European ones, and should be applied to the creatures which most resemble (not in external appearances, but in habits and internal structure) those which bear the same names in Europe. The European hedgehog is of the badger species; and as we have the badger in this country I consider the term "hedgehog" a misnomer when applied to the porcupine. I conclude by urging the general adoption of naturalists' common names, and dropping local names. If we constantly read of an object by one name, it will soon require no effort to speak of it by that name.

—ROAMER.

NOTES ON THE BUTCHER BIRD—*Collyris borealis*.

—[We print the subjoined communication with no little pride, for it is the production of a young naturalist only fifteen years old. We print it as sent us, *verbatim et literatim*, and find it but little defective in any particular. Our young correspondent can not only prepare and mount his specimens, but he had quite a large collection destroyed by the Chicago fire. Since that catastrophe he has collected over one hundred specimens of the birds of that region, which he shot himself, devoting all his spare time to the pursuit.—Ed. F. and S.]

EDITOR FOREST AND STREAM:—

There have been a good many Butcher Birds here this winter. Before this I imagined that they were quite rare. They seem to like to sit on the tops of old dead trees about here. They are restless and seldom stay long at one place and are continually jerking their tails like magpies and jays, which they much resemble in their ways. They are not gregarious at all (as far as I know), as I have never seen two together. I once noticed one stop in its flight, which resembles that of a woodpecker or jay, and hover over a spot, very much as a kingfisher often does, suddenly dart down with closed wings, seize a mouse and flit to the top of a dead weed and devour it. There are a great many mice among the dead weeds, and that is what attracts the Butcher Birds. There is a malt house near by and they stay around it to catch the mice which live upon the grain. I have seen within the area of one-eighth of a mile no less than a dozen impaled mice. They impale their food not only for future use, but also to help them to tear it to pieces while eating. They eat their food, bones, skin and all, only leaving a few tufts of hair on the twig or thorn upon which it was impaled. One day I saw one catch a mouse, impale it, and then commenced tearing it to pieces. I crawled up near it, but it not liking company while at dinner, flew off, carrying its dinner with it. Another time we heard a great screaming and scolding and went back to find what was the matter, and found a Butcher Bird very much excited about a little Mottled Owl which it had discovered hid away in a dwarf oak covered with wild grapevine, and which was staring about in a very stupid manner. When one is wounded it will make a hard fight before it gives up, and will often draw blood with its strong hooked bill, from the incautious hand which attempts to seize it.

R. P. C.

CHICAGO, 1873.

CENTRAL PARK MENAGERIE.

DEPARTMENT OF PUBLIC PARKS,
NEW YORK, January 24, 1874.

Animals received at Central Park Menagerie for the week ending January 22, 1874:

One Common Starling, *Sturnus vulgaris*; hab. Australia; purchased.
Four Black Swans, *Cygnus atavus*; hab. Australia; purchased.
One Muskrat, *Fiber zibethicus*, presented by Mr. Carryl.
One Painted Turtle, *Emys picta*, presented by Miss Stella Sturgis.
W. A. CONKLIN.

—Mr. Harness tells this of the banker poet, Rogers, who was unfortunate in his servants:—On one occasion, when in the country, his favorite groom, with whom he used to drive every day, gave notice to leave. Rogers asked him why he was going, and what he had to complain of. "Nothing," replied the man, "but you are so dull in the buggy." *Harper's Drawer*.

103 FULTON STREET, NEW YORK.

Terms, Five Dollars a Year, Strictly in Advance.

A discount of twenty per cent. for five copies and upwards. Any person sending us two subscriptions and Ten Dollars will receive a copy of Hallock's "Fishing Tourist," postage free.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices, 50 cents per line. Advertisements in double column 25 per cent. extra. Where advertisements are inserted over 1 month, a discount of 10 per cent. will be made; over three months, 20 per cent; over six months, 30 per cent.

NEW YORK, THURSDAY, JAN. 29, 1874.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal letters only, to the Manager.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited.

We cannot promise to return rejected manuscripts.

Ladies are especially invited to use our columns, which will be prepared with careful reference to their perusal and instruction.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

CHARLES HALLOCK,
Managing Editor.

THE INTER-COLLEGIATE REGATTA—
THE QUESTION OF SARATOGA.

FROM the careful report of the Rowing Convention, sent to us by our own correspondent, the public may gain information in regard to the important subject as to where the next great university race is to be held.

We can fully appreciate the motives which actuated gentlemen who were earnest in their endeavors to have the contest take place at Saratoga, and those opposed to it. We do not in the least incline to think that the measures urged for or against Saratoga were inspired by any other feelings than those tending to the ultimate advantage of the University Rowing Associations of the country; nor are we at all surprised that a notable crew (as may be seen by our later advices) had bolted the Convention, having determined not to row at Saratoga.

No one speaks of Saratoga as a boating race ground without being of the decided opinion that it is the most perfect piece of water for such purposes in the country, and that it is so situated geographically as to be of easy access for eastern and northern University Rowing Clubs. Where, then, is the hitch?

The distaste certainly arises from the unfortunate fact that though Saratoga is thronged for months in the gayest season of the year with all the wealth and grace of the country, still there is an unfortunate prestige about Saratoga which certain men, and certain good, honest, simple fathers and mothers, and the teachers and professors of these rowing men, feel. If this sentiment did not find in the Hartford Convention its fullest expression, it is talked about and commented upon in the homes and by the fire-sides of the students. It may be squeamishness, it may be a false sentiment, but we are forced to make the positive statement that Saratoga is objected to mainly from the fear that the college men may be led astray, or have thrown on them the imputation of having been conspicuous actors at a place where vice too often lifts its head, and rarely finds a voice which calls things by their proper names.

Of the Saratoga Rowing Association, we cannot but speak in the highest terms. No one thinks otherwise than that the association will carry out in every way the arrangements proposed by them, and that they are keenly aware, as fully as we are, how prejudicial all the bad elements which outcrop there are to the rowing interests of the United States. One thing we feel certain of, and that is that when the race does take place, the actions of all the men making up the

crews, and of their associates, will be carefully watched, and that should the least thing occur, prejudicial to morals, all future courses at Saratoga will be forever tabooed, and other places, with less of a social taint, even having much less rowing advantages, will be selected.

Where an University race is to be held, must be at all times a difficult problem to solve. Putting entirely aside the questions of locality or convenience as to racing or training, a contest between University crews—do what conventions may—must always take the decided character of a public exhibition. Such boating events will invariably be attended by tens of thousands of spectators, an audience made up of the most incongruous elements, which audience, we fancy, is no better or no worse, as to component parts, than that which would be collected in any other part of the world.

THE ANGLO-AMERICAN MATCH.

LETTER FROM MR. PRICE, THE OWNER OF BELLE.

WE are pleased to lay before the readers of the FOREST AND STREAM and all American sportsmen the very courteous letter sent to us by Mr. R. T. Lloyd Price, the owner of the famous dog Belle, the winner of the Rhiwlas pointer and setter trials of 1873.

We have to congratulate ourselves that we have not been too premature in stating the rules governing such Field Trials, and that we have been cautious in regard to publishing any rules whatsoever without the certainty that such rules were exact.

It must be evident to any one acquainted with the peculiarities of those entering into contests of any kind, how half the trouble arises, from the fact of matters not being thoroughly understood at the commencement. In event of any disputes, arising from misconception of the rules, after we have given them due publicity, we must therefore be held blameless.

We have no reason, however, to suppose that such contingencies can arise, but representing as we do the interests of both the United States and England, and desirous to see these Field Trials amicably and pleasantly concluded, it particularly behooves us to be careful in any detail.

The Field Trials, we find from Mr. Price's letter, were inaugurated, and are carried out under the supervision of the members of the Kennel Club. This is an organization of gentlemen who are strictly ballotted for, and all men who enjoy the highest social position in England, among them we find the Marquis of Huntly, Marquis of Buchanan, the Earl of Onslow, Lord Lurgan, (the owner of the famous greyhound, the late Master McGrath), The Hon. R. C. Hal, Major Platt, the Revd. J. C. Macdona, and many other leading representative Englishmen. The Kennel Club lays down the rules for not only the canine exhibitions at Sydenham, Birmingham, Nottingham and elsewhere, but determines how the Field Trials shall be contested. In fact the Kennel Club is a body of elite, who actuated by the love of the dog, devote their attention to developing his excellence in every way.

It will be seen that Mr. Price believes in the possibility of getting some of the English Sportsmen to visit this country, and to make a trial of their English dogs here on our own stamping ground. We feel sure that we express the sentiment of every American gentleman when we state that any sportsman coming here to try our prairies and our game, would be received with the greatest courtesy, and all would vie in making him welcome.

We must express ourselves more than pleased by the tone of Mr. Price's communication, when he says that "The match is proposed by us entirely in a friendly spirit," and can either he run for glory alone or for a good stake.

RHIWLAS, BALA., MERIONETHSHIRE, N. WALES,
January 8th, 1874.

EDITOR FOREST AND STREAM:—

I enclose you the regulations of the two principal Field Trial Meetings that have been held this year, with the names of the winners of the various stakes attached, which may in part afford you the desired information. The Kennel Club consists of a number of gentlemen, leading men in sporting affairs, who are strictly ballotted for, and all men of the highest position. They constitute in fact "The Jockey Club," in shooting matters and dog shows, and all cases of disputes at "Field Trials" are I believe referred to them. They organize every June a very large dog show at the Crystal Palace, with that held at Birmingham, which are the most successful and best arranged shows in existence.

The Kennel Club organized also the very successful and well attended Field Trials, held last September, and they intend continuing them. They are compiling a book, containing the names, pedigrees and histories of all fine winning dogs, both in the field and on the show bench, somewhat similar in fact to the Shorthorn Herd Book. It is the intention of Mr. Macdona and myself, should the Anglo-American Match come off, to place the matter entirely in the hands of the Kennel Club, to select the dogs to compete for England, and to make all arrangements in order that there can be no question as to everything being arranged with ability and uprightness. Mr. Macdona and myself have won the principal prizes at Field Trials this year with our representatives, Ranger, (setter) and Belle, (pointer). We consider ourselves therefore fairly entitled to represent the mother country in this matter; but should the committee of the Kennel Club consider that better dogs can be found to run in England, we shall give way to their opinion in-

stantly. The match is proposed by us entirely in a friendly spirit, and can be run for glory alone, or for a good stake. As to the proposition which I see in FOREST AND STREAM, that we should cross the Atlantic with our dogs, I can only say in behalf of Mr. Macdona and myself, that nothing would give us greater pleasure. Personally there is nothing I can conceive more enjoyable than to visit your grand country, but family ties might prevent our absence for the lengthy period which would be necessary.

I have little doubt, however, that some aspiring young bachelors might easily be found. I know of two gentlemen owning fine dogs, who might be willing to show their animals off on your prairies, than which I cannot conceive any grounds more suitable. I have no doubt but that the Kennel Club would welcome with open arms any American gentlemen interested in sporting matters, who might wish to join them. Truly yours, W. T. LLOYD PRICE.

[Suggestions as to Field Trials to suit American-bred setters will be published next week.]

REPORT OF THE STATE COMMISSIONERS OF FISHERIES OF PENNSYLVANIA FOR 1873.

THE report of Messrs. H. J. Reeder, B. J. Hewitt, and James Duffy, State Commissioners of Fisheries for Pennsylvania, is a most thorough and interesting document. Pennsylvania, though not enjoying the peculiar lacustrine formations which abound in New York, has many noble rivers. Of these the Delaware River is the most remarkable, and once abounded with fish. In our review of the report of the New Jersey Fishery Commissioners, we stated how the shad were diminishing in the Delaware River. As the Jersey fishermen spoil every chance of gaining a livelihood on the Delaware by the most reckless and indiscriminate fishing, it is not to be expected that those of the same craft on the Pennsylvania side are any wiser. Commencing almost with the very first lines of the report, we read "that a large number of streams running through our State [Pennsylvania] has become so depopulated of fishes by persistent, wanton slaughter as to render them almost valueless to our people as a source of food." In regard to shad, which particular fishery occupies the bulk of the report, we find it stated that illegal, indiscriminate, and wasteful fishing has almost depopulated the great streams of the State emptying into the Atlantic, which at one time abounded with this valuable and esculent fish. Nothing can show this fact in a stronger light than that during the last season, of all the fishing associations on the Delaware only six found it a remunerative business. The commissioners attribute this deterioration in quality and quantity to three causes. First. The practice of fishing with drift nets in the lower portions of the river. Second. That the close season, or the time during which fishing is forbidden in the rivers, is not sufficiently long and sufficiently observed; and third, the destruction of the young shad when returning to the sea by fish baskets. The New Jersey commissioners fully described the character of these nets. Like walls, they are made to sweep almost across the entire channel of a river, and differ from nets which are set. These nets float up and down with the tide, catching all the fish in the river, or chasing them away. As to the close time, discussed in full by the commissioners, it is declared to be too short. After every invention that human ingenuity can devise has been brought into play to catch the fish every day in the week save Sunday, the fish are then allowed breathing time from midnight of Saturday until midnight of Sunday only. The commissioners ask that the fish be given but a few more hours' respite, and that the time be extended from sunset of a Saturday until midnight of Sunday, only some six hours more. But of all the wretched methods of killing the small shad the fish baskets are the most to be decried. These instruments of extirpation are placed in mid-channel of the river, with wings of stone, extending on either side toward the shores. Of course it is utterly impossible for any fish to escape the basket. Even if some few fish do get through they are so much bruised as to perish miserably after their escape. Nothing is more delicate than the fish organism in its tender younger stage, and the abrasion of a single scale kills a young fish, most especially a shad. Cases have come under the notice of the commissioners where more than a cart load of young shad have been removed from these wretched fish baskets. Calculate, if you can, the heedless waste of money—of food here. Young fish, useless as a nutritious aliment to man, even too insignificant to be employed as a manure, if they had been allowed to grow, and had then been caught at the proper season, would have fed over five thousand men, and would have represented no inconsiderable amount of money. The commissioners beg the Legislature to make laws for their immediate destruction. To-day the law allows a ten days' notice given by the sheriff before proceeding to destroy the basket; the commissioners want the fish baskets to be done away with at once, on sight.

How shall the Delaware and the other rivers of the State of Pennsylvania be restocked with fish? It seems as if the interests involved in the drift nets were too numerous to be done away with by any summary enactment, but a more strict and somewhat increased period of close time, and the utter stopping of the erection of fish baskets on any stream in the State, may, it is hoped, somewhat improve the condition of things. But the chief reliance of the commissioners is in artificial propagation. Citing the brilliant examples of Connecticut, where the shad have so in-

creased by means of propagation that the fishermen complain no longer of the paucity of fish, but that the market is overstocked with shad, our commissioners have set to work with a will to give the State all the advantages of the most improved methods of pisciculture. Mr. Seth Green's admirable process, and the peculiar mode of hatching boxes, have again been found the most economical and successful, and though last season the first attempts, owing to some capricious influences of temperature, did not render the hatching out of the fish as plentiful as to yield as might have been hoped for, a goodly number of young shad have been introduced into the Delaware and Susquehanna rivers. Of course the results of these operations will not be apparent for some time to come, but of their ultimate success no one can doubt.

A most interesting portion of the report is that devoted to fish ways. The action of the commissioners in respect to this important point seems to us to have been quite judicious. Instead of going to work in an indiscriminate way, it was determined to construct a fish way at the expense of the State, which, after having been subjected to a thorough test, if it proved satisfactory, would be the model to adopt. Such a one was constructed at Columbia, and was completed in December last at a cost of \$11,503, which has some novel features. Of course it is too early to determine whether the plan adopted by the commissioners is a good one. The commissioners speak with pride of the State hatching house at Marietta, Lancaster county, which they think is the largest and best constructed fish hatching house in the country.

Black bass of the north (*Grystes Nigricans*), and the bass of the south (*G. salmoides*) have also occupied the attention of the commissioners. The former is a most prolific fish, is easily raised, and is one of the few fish that cares for its young, guarding the beds where their spawn is placed, and driving away predatory fish. Sixteen years ago some few of these fish were carried in the roughest way in the tank of a locomotive from Pennsylvania and dropped into the Potomac near Harper's Ferry, and have become wonderfully abundant. This fish requires, fortunately, but little care from the commissioners, but the *G. salmoides*, which they think would be useful on smaller lakes, they have attempted to introduce. Some of these fish were placed in Pennsylvania waters by private gentlemen, and the fish having been taken from the Potomac, have done remarkably well. Of salmon, the commissioners hope to introduce the *Salmo salar* and *S. quinnat*, the former from Nova Scotia, the latter from our Pacific slopes, into the Delaware and Susquehanna.

As to the allusion made in the report to "the great stores of salmon" seen by Hendrick Hudson in our great river, we must respectfully differ from the commissioners believing that Hudson was a better navigator than ichthyologist, and that the same vagueness in regard to salmon in the Delaware is applicable to the noble fish in our own Hudson. But the proof of the pudding is in the eating of it, and as in 1871 some gentlemen of Easton and Philadelphia brought from Canada 10,000 salmon eggs, and some 2,500 were put in the Delaware, and as in 1872 Mr. Thaddeus Norris placed more young salmon in the river, and in all, from various contributions, some 58,500 specimens of the *S. salar* have been put in the Delaware, and as "par" in several instances have been caught, we may trust yet to see the salmon caught in Pennsylvania rivers.

Of pike perch (*Lucioperca Americana*), a fish once famous in the Susquehanna and Juniata, and only found there, the commissioners notice that owing to the reckless and indiscriminate slaughter of these fish they have almost disappeared. The commissioners intend to make attempts for their artificial propagation, and so to restock the waters. The Commissioners of Fisheries of the good State of Pennsylvania have a right to look with pride on their exertions, and can safely state that in during eight months they have made considerable progress in the work of restoring the fisheries. It remains with the Legislature to place at their command the material aid necessary for the accomplishment of their important work.

—An Exhibition of a remarkably interesting character has been resolved upon by Her Majesty's Commissioners, which is to be arranged in the galleries of the Royal Albert Hall. This collection is to embrace life size figures of the aboriginal inhabitants found in the British dominions, models of their dwellings, samples of their utensils, weapons of war, boats and canoes, agricultural, musical and manufacturing instruments and implements—all objects tending to explain their ethnological position and condition of civilization. The civil, military and naval officers of the British service throughout the Queen's dominions will assist in forming this wonderful collection. Offers of gifts and loans are requested. It is indeed a grand conception, and will be unique of its kind.

INDIAN RELICS.—A large skeleton, evidently that of an Indian, was recently exhumed upon the estate of Mr. Young, at Bath, L. I. The jaw bones are very prominent, the forehead low, and retreating. The arm bones are small in proportion, and the leg bones are unusually large. The incisors are worn down to half their natural length, but still in a good state of preservation. The skeleton is lying on its right side, with its legs drawn up closely to the body, and the face is turned toward the east. It is probably the relic of a middle aged warrior. Other older remains have been found, which are scarcely distinguishable as skeletons. Old metal buttons, spear heads, gun flints, &c., have been dug up near the skeletons. The place where they were found is on the top of a knoll in an open field.

CREEDMOOR. MATCH OF THE NATIONAL RIFLE ASSOCIATION —OCTOBER, 1873.

(Continued from No. 23 of January 15th.)

COMPETITION V.

ARMY AND NAVY JOURNAL MATCH.

Open to teams of twelve from all regularly organized military organizations in the United States, including the Regular Army, Navy and Marine Corps. All competitors to be regularly enlisted members in good standing of the regiment they represent, and to have been such on August 1, 1873, and to appear in uniform (full dress or fatigue).

Weapon, any military rifle. Distance, 500 yards. Rounds, seven. Position, any. Entrance fee, \$1 each competitor.

1st Prize—To the regiment whose team makes the highest score, a Silver Trophy, manufactured by the Gorham Manufacturing Company, and presented by Col. Wm. C. Church on behalf of the *Army and Navy Journal*. This prize is to be won three times before becoming the property of the winner. It will be held for a year by the officer commanding the winning corps, and a large photograph of it presented to each member of the winning team.

2d Prize—To the regiment whose team makes the second best score, a Silver Cup.

3d Prize—To the regiment whose team makes the third best score, a Silver Cup.

4th Prize—To the best individual score, a Silver Medal.

5th Prize—To the second best individual score, a Life Membership in N. R. A.

6th, 7th, 8th, 9th and 10th Prizes—To the five next best individual scores, Bronze Medals.

Sporting News from Abroad.

DISCUSSIONS for and against battues, still agitate our English friends. In our own country, though slaughters of truly wild animals and birds, such as range free in their native condition, are not unfrequent, we cannot say that we accord to such "killings" our approval. Two parties set out, shoot indiscriminately every living creature which passes before them, and then count the number of heads of birds or beasts thus destroyed. Very often in the category are found animals not game, and which, when killed, are useless as food. Nothing comes amiss from a deer to a chip-munk, and all are exterminated in order to swell up the total bag. We assert that such wholesale killing tends to brutalize sport, and hardens human sensibilities. If it is held that with us in the United States, such battues are no kid glove affairs, but require a great deal of the country to be worked over, and the development of sportsmanlike qualities, they are nevertheless cruel, and animal life is uselessly wasted. We therefore, of the FOREST AND STREAM, whose duty it is to lead public opinion in regard to such matters, are most certainly inclined on the side of humanity, and decried such proceedings. Mr. Morris, who writes, we think, a pretty good cudgel, belabors most soundly in the columns of the *Field* the advocates of the battue. This gentleman cites an instance of the unsportsmanlike character of such amusements, when on the occasion of a recent pheasant battue, the good old foster-mother, under whose downy breast the young pheasant chicks had been warmed into life, came near becoming a victim. "The poor old bird," says Mr. Morris, "was about to share the dismal and untimely fate of her foster brood, these noble shooters firing pretty much at random in the middle of the flock, when fortunately for her, shouted out gude wife, under whose care the brood (of pheasants) had been reared, 'O, don't shoot my old hen.'" *Punch*, the just censor of English morals, was the first to direct attention towards these matters, and his caricature of gentlemen behind hedges seated in arm chairs, letting fly at partridges, in partridge driving, has not been without effect. The defence of those indulging in this sport has already been mentioned by us; now it seems that those who shoot at partridge drives do not use arm-chairs, but camp stools.

—Sometime ago we published an account of the enormous quantity of hares and rabbits produced in the United Kingdom, but it seems that in Ireland the hare is lessening in number; and coursing is now at fault. We should think that poaching in Ireland would be especially difficult to overcome. There is an inherent love of sport in all classes of the Irish, which leads them to the hunting of all animals from pure love of the thing. Poaching is reported to be prevalent all over the "ould sod," and that respectable people, "who ought to know better, but don't," take up a hare with a hound whenever there is a chance. When reading Mr. Froude, and his general strictures on the Irish people, perhaps the most amusing chapters were those where he details the irrepressible trait the Hibernians possessed a century or so ago of smuggling famous wines, all bright and glowing with the warmth of sunny France, into the country. Perhaps some future historian will bring poaching up as another sin against the Irish. A recommendation is thrown out that the constabulary should haul over the coals any unqualified person keeping a greyhound. This sounds very much like an echo from the feudal times. To poach is bad, but to prevent a man keeping any kind of animal he pleases, (save a tiger or a lion loose) seems to us to be preposterous, even when the idea is advanced in the mildest way.

—Ideas in regard to swimming, with the cold wave just on us, in the Northern States, rather puts one's teeth on edge. Some weeks ago, the demise of Brock, a fisherman, who died in the most natural manner, was recorded. This man had saved himself from death some thirty years before by swimming, after having been in the water some seven and a-half hours. About two years ago, J. B. Johnson attempted to cross the English channel, and was taken out of the water, after an hour, almost exhausted. It seems pretty certain, that expertness in swimming is not always combined with the power of lasting in the water, which latter point is entirely not one of strength or endurance, but of a peculiar physical condition. Your thin-spare man may make the most elegant movements in the water, and make the best time, but it is, as all our readers know, the fat obese oily-looking man, who has the staying power. Muscles and thews, greyhound like in a man, are good for the top of the earth, to keep skimming away for hours on the race-track, but something in the semblance of a seal, in human shape, we should fancy would be the better for those who want to stay at sea. It is the cold water, the temperature, which has much to do with the staying power of swimming. We often read romantic stories of the Typee order, where fair dusky maidens, who dwell where the palm trees shade their islands, plunge boldly out into the seas, and like mermaids assume an amphibious character, swimming on forever. Just take one of these fair nymphs and

put her in a sea some twenty-five degrees lower in temperature than that tepid Oceanic water, and she would shortly cry "enough."

—With gambling we have nothing to do, save record the suicide of some poor wretch at Monaco, the modern European hell, where Messieurs Benazet and Blanc now hold high carnival, and to draw the sad moral from this miserable death. The *Field* has a carefully written editorial in regard to gambling, where it asserts "that gambling in England is to a great extent done away with." Of course it exists to a certain extent in London just as it does in New York, and perhaps more money is lost at sober whist in the clubs in London than in New York. If however, we at present can claim no superiority in this way, how long gambling may continue in the present quiescent condition in the United States we cannot state. Perhaps in time Saratoga may flaunt its gambling claims more brazenly and may even rival puny Monaco. It is not impossible to imagine that before long the crack of the suicide's pistol may be heard resounding in that most frequented American resort, and for a moment a spasm of conscience be felt, which the whole press of the United States will descant upon, and no end of well-written quiverings (in editorials), he eliminated therefrom. When a poor devil had lost his last piece of money at Baden, and then blew his brains out, lest it should be said that *Rouge et Noir* had killed him, agents attached to the establishment used, it is said, like buzzards scenting out the dead man, to place a sum of money in the pocket of the victim. Of course the world was made to believe that loss of money at the gambling table had not caused the death. Our contemporary states how this worked very well, until a canny Scotchman (Yankee?) learned the dodge, and fired off continually blank cartridges in retired spots of the Coursall, then "laid him down to de" in a most composed way. Then would hasten one of the attaches of Benazet and pop a roll of gold into the breeches pocket of the pseudo suicide, who as soon as the coast was clear, would immediately get up again and walk off with his gains.

—Of the Australian cricket match, short mention of which was made in our last, we have as yet but meagre details. The Victorians were first at the bat and made a total of 267. The Grace eleven were beaten. *Land and Water* "presumes that Mr. Grace saw the whole side out in the first innings, for he carried out his bat for 51, and made 33 in the second, or 84 out of the total 247 runs." The second match at Ballarat against 22 had just reached England; here the English team were the conquerors. The Grace team scoring 470, of which the Leviathan made 126, very much over the third of the whole score.

—Some very curious facts in regard to the breeding of ostriches, we take from the publications of the Paris Acclimatization Society. The number of eggs laid by the female averages about eighteen, though she does not hatch out the whole number, some of them being preserved by the hen bird as food for the ostrich chicks. Curious as this may seem, nature seems to point to such a peculiar kind of nourishment as necessary, because in the midst of the desert, where the young birds are born, there is no food. Both male and female help to make the nest, which is a simple hollow in the sand. Experiments seem to show that the organ of hearing is singularly defective in the ostrich. Adult birds consume 3 pounds of grain a day.

WHAT OUR ENGLISH FRIENDS THINK OF CREEDMOOR.

From the London *Volunteer Service Gazette*, an admirable paper, devoted to the interest of the Volunteer Service of England and the official organ, we take the following most flattering review of the late Creedmoor campaign. Some of the suggestions conveyed in the article which we copy may be of use to our riflemen. We fully appreciate the good feeling evinced by the *Volunteer Service Gazette*, and trust that we may soon welcome some of the representatives of the Wimbledon range at Creedmoor.

THE UNITED STATES RIFLE ASSOCIATION.

There is something particularly curious and interesting in the perusal of the full report which we took last week from a New York contemporary, of the Prize Meeting of the newly-established United States Rifle Association. It is pretty obvious that after all these years our American cousins are going in with a will for military rifle shooting, and we may now hope to look forward to much pleasant rivalry. Major Leech, the indefatigable promoter of Irish rifle shooting, having set the ball rolling by offering to take an Irish team over to compete with the Americans on their own ground. As we have often said, international matches of this kind are open to none of the objections which are at least possible with regard to greet promiscuous gatherings nearer home, and we may fairly look for Yankee teams being frequent and welcome guests at Wimbledon, and English, Scotch, or Irish teams at Creedmoor.

In reading the account of the origin of the Creedmoor Range, we are at once struck with respectful astonishment at finding that the State of New York contributed five-sixths of the purchase money of the range, besides promising prizes! The range itself, situated on Long Island, is "as level as a billiard table," and affords accommodation for twenty targets, all available up to 500 yards, and most of them up to 1,000 yards. A committee of officers was sent to England, and they seem to have taken back with them a false comprehension of our system. One advantage that the range of Creedmoor has over that at Wimbledon is that it appears to be available at all times; and we are told that no less than 4,000 men practised at it during the month preceeding the prizemeeting. There were at the meeting twelve competitions at our accustomed Wimbledon ranges (one of them at 1,000 yards). Most of the competitions were confined to "National Guardsmen," but some were open. One of them may give a hint to the

Council of our National Rifle Association. It was a match open to representatives from any regular newspaper or periodical, each required to be a *bona fide* employe thereof. There were five or more competitors, and the prize was won by Ex-Governor Hawley, of the *Hartford Courant*, whose score is recorded as 36 at 400 and 500 yards, five at each, any rifle. There were, we are glad to see, two "team" matches, and the Remington Rifle seems to be the favorite military arm. The shooting was very fair, even in the military matches; and in the so-called Sharpshooters' at 800 and 1,000 yards, the prize was carried off, as we have before mentioned, by Mr. Adam, of the Canadian Volunteers, with the score of 48 out of 56. A New York guardsman, Mr. Roux, came next with 41. An excellent paper, something like our *Field*, called FOREST AND STREAM, from which we take our reports, gives, as will have been seen in our last number, all sorts of details of new prizes given by newspaper proprietors, by gun-makers, and many others. The meeting is described as having been excellently conducted, without any instances of intoxication or gambling. Some parties, we are told, were on the ground early, intent on starting pools, but such requests were promptly denied and squelched on the spot. Of course this refers to betting, and not to such pool as we know at Wimbledon, which the United States Rifle Association will, if it extends its operations, probably find it necessary to organize as soon as possible.

The new Association has, if it pleases the American people, a great future before it. It is started with all the benefit of over fourteen years' experience at Wimbledon, and untrammelled by many of our difficulties. What we would warn our friends on the other side of the Atlantic to cling to is the generally military character of the meeting. It is this character, we are convinced which imperfectly as it has been preserved at Wimbledon, has alone prevented rifle shooting from degenerating into an ignoble game, with all the concomitants of a race-course or a pigeon match. If the National Guards of the United States learn the use of their Remingtons at Creedmoor as the Volunteers of Great Britain have learned the use of their Sniders at Wimbledon, they will soon reach the Regular troops, who are described as looking on with some curiosity at the matches—that a soldier's firearm is intended for something else than the manual exercise. We may also hope that the proverbial ingenuity of the Yankee will not only be devoted to improving, if that be possible, the rifle itself, but to solving some of the problems as to marking and scoring, which are becoming every year more troublesome at Wimbledon. We shall be very much surprised if the Americans are long contented with our clumsy iron targets, with their rude divisions, and their unsatisfactory marking; and we can give them every assurance that we shall not be in the least too proud to adopt any improvement which may come to us from over the water. We cannot help, before concluding, expressing our regret that the United States Association has not had the courage to prohibit the use of mere target-rifles in any of its matches. They never were contemplated originally here, and only came into use in consequence of the lax way in which the rules were drawn. A rifle should be an instrument which can be used with some hope of success against either a soldier or a wild animal, and our old friend, which we used to call *par excellence* the "small-bore," certainly did not fulfill either of these conditions.

DEATH OF LIVINGSTONE.—From England comes a dispatch announcing the death of Dr. David Livingstone, who succumbed to fever in Central Africa. The news seems to be fairly authentic, and the information goes so far as to state that the body of the most distinguished traveler of the country is now *en route* for Zanzibar, to be sent to England. Born near Glasgow in 1815, bred as a missionary, Livingstone followed the adventurous and perilous course of exploring Central Africa, and of giving spiritual aid to its benighted inhabitants. For over thirty-five years Dr. Livingstone has led this erratic life, and it has been a wonder to all how the man could have lived through all the dangers of climate and barbarous surroundings. The world is indebted to Livingstone, not only as one who has nobly strived to advance Christianity, but as an explorer, endeavoring to open the interior of Africa to the commerce of the world. We trust, though noticing some incidents in Dr. Livingstone's wonderful life, it may not be, after all, his obituary.

TRIBUNE CORNER-STONE CELEBRATION.—All American journalism congratulates the *New York Tribune* on the laying of the corner-stone on which their new handsome building is to be erected. But it is not the fact of the construction of a new building which we care for. Other structures may rise far grander, more imposing, in time to come, and pass unheeded. The *Tribune* building serves, though, to perpetuate the memory of that bravest and most conscientious of men, Horace Greeley, who won renown and fame as a journalist, and that is why we, with so many others, chronicle the event. May the *Tribune* building long stand overshadowing Printing House Square as a lasting monument of the earnest life of its founder. Mr. Ripley and Mr. Whitelaw Reid attended the ceremony, and Miss Ida Greeley placed the stone in position.

CORRESPONDENCE.—The following accepted articles have been necessarily deferred:—A Buffalo Hunt; Reminiscences of Lake Superior; Reminiscences of the Adirondacks; Random Gossip from a Sportsman; Duck Shooting; Big Clear, Adirondacks; Fishing and Hunting at Humboldt's Bay, California; A Day at St. Augustine, Florida; A Cruise on the West Coast of Africa; A day on the Raquette; The Sceptic Reproved; Hunt on Seneca River; Down the St. Lawrence; Albinos; and many others already acknowledged.

—Our correspondents, Profs. Ew'd Palmer and Samuel C. Clarke, are both *en route* for Florida for scientific objects. We shall hear from them betimes.

—Thanks to Prof. F. V. Hayden for Bulletin of the U. S. Geological and Geographical Survey.

The Kennel.

THE MYSTIC SKETCHES.

Questions Can Dogs Reason?

Answer. I truly believe they can.

I read with much pleasure the article in No. 23 of FOREST AND STREAM, and I am glad to see such and similar enquiries made as often as they are. It is a true index of the great value of the paper as a vehicle of valuable information such as very many would like to possess. While I admit "Dick" to have been quite a sensible dog, and a persevering pointer, true to his natural instinct or reason, for he knew by some dog logic that there was no use in shooting that bird over again, consequently he "went in to win and save ammunition." To me this looks like reason, or highly educated and well trained intellect. I have in my sporting days owned good dogs, and can still appreciate the good points of a good dog.

I owned a fine cross of the terrier and the spaniel, who was a very intelligent, truthful dog; he never lied, and he was seldom guilty of "barking up the wrong tree." This dog would, when not often shot over, go off on his own account hunting, and bring home rabbits, squirrels, woodchucks, and sometimes a big snake, (for he would kill snakes.) I have frequently known him to go out hunting, and be gone one hour or two, and return and go directly to a neighbor's who owned a good hunting dog. "Tip" would go straight up to "Lion," put their noses together, shake their tails, and seem to be on the very best of terms, and in a minute or two both dogs would go off at a good round trot in the direction from which Tip came. This occurred several times, and I was induced one day from the earnestness displayed by my dog to follow them, as I did. On arriving at the woods, near a pond hole, I found a former dwelling place of a woodchuck, two large holes quite near together. At the mouth of one hole one dog was digging with all his might; at the other hole the other dog kept watch. One would work a few moments and relieve the other; both would dig at the same entrance. I seated myself at a convenient distance and awaited the end of this curious dog hunt. I had not long to wait, for soon out came out an "old coon," who was most summarily disposed of by the two dogs. This seems to me like instinct; and if it is a pretty good dog story, it has the merit of being true in every particular. I have since heard of several instances of a like canine copartnership, which induces me to believe dogs reason or possess some means of communicating their desires, which seems very like it to me. Yours, L. WYMAN.

FOX HOUNDS OF VIRGINIA.

WINCHESTER, VA., January 26, 1874.

EDITOR FOREST AND STREAM:—

In compliance with a promise made to you some weeks since upon the subject of the fox hounds, I now take up my pen to fulfill the same, though I fear that the information I have to impart will not fully meet all the requirements.

Our knowledge of the original importation of the fox hounds into this section is in a measure traditional. I have always understood, however, that the first importation of pure fox hounds into this part of our State, (the Valley, or Middle Virginia,) was made during Colonial times by Lord Thomas Fairfax, of Greenway Court, in the county of Clarke. Our present strain of dogs is supposed to be derived from these, with occasional crosses upon dogs brought from East Virginia and Maryland and others imported direct from England. Others also imported dogs in Colonial times, especially the family of the Wormleys; but our fox hunters have generally traced their best dogs back to the Fairfax strain. I am unable to answer your enquiry as to the number of fox hounds in Virginia and the South generally at the present time. Fox hounds were very numerous in Middle and East Virginia anterior to the civil war, but were sadly thinned out during the prevalence of the strife, having been seized and carried off by the invading armies.

As to the breed of dogs we prefer I will state emphatically that we prefer our native or acclimated dogs, as they invariably proved themselves superior in every particular to their imported English cousins. The same remark will apply to our native pointers and setters as compared with imported stock.

As it requires a dog of the finest nose, speed and bottom to overhaul a red fox in our difficult country, we endeavor to combine those three most important attributes in as high a degree as possible in our breeding. A dog bred merely for nose and bottom, (as is the custom with the English,) can never catch a full grown, empty red fox in this section; a fact that has fallen under my observation "many times and oft." In order to gain nose and foot I have known some sportsmen to cross the fox hound with the pointer, but this custom is generally reprobated inasmuch as a dog of this mongrel origin will not *hang on* like a pure fox hound.

As we have never been accustomed to time our dogs, I am therefore unable to give you the precise rate of speed at which they run. The fact of their being able to pick up occasionally a full grown, empty red fox within the hour, may enable you to form some idea of their speed. A large dog is preferred for a flat country; a small or medium sized one for ground of an opposite character. Our sportsmen have no regular system. They usually feed their dogs on Indian meal boiled in pot liquor, together with offal from the dairy and butcher's stall. The dogs are generally kept up and fed on dry bread for some days previous to a chase, meat being considered as injurious to the nose, though I am unable to vouch for the reliability of this popular opinion.

Many sportsmen train the pups with their dams. The drag also is frequently used, as it teaches the whelp to find and follow a trail. Some caution is necessary not to permit the whelps to go into a regular chase with the old hounds, as their inability to keep up with their seniors has a tendency to discourage them.

I have never known a sportsman to shoot a fox. I have often known a gunner to get a good sound "cussin'" by a fox hunter for shooting his fox when in full chase. In conclusion, permit me to remark that neither fox hunting nor other field sports are followed to the same extent at present as they were before the war, owing to the general impoverishment of our people consequent upon the civil strife, Dr. A. W.

THE PROPOSED FIELD TRIAL.

EDITOR FOREST AND STREAM:—

DEAR SIR:—I am much interested in the proposed field trials between American and English pointers and setters. If the Englishmen could be induced to bring their dogs to an Illinois prairie, and try them on grouse, I believe that dogs could be found in Chicago and St. Louis that would win the match. At least we had dogs there twenty-five years ago, when I was a shooter, that could not be easily beaten. There would also be this advantage that birds would be plenty, which I believe is not the case at present in Scotland. But I doubt if you could get the Englishmen to give up the advantage of having the trial on that side of the water. I have no faith in English fair play.

A friend of mine in Boston, many years ago, who broke his own dogs, and who was the most thorough sportsman I ever knew, once sold a favorite setter to an English gentleman to take home with him. The Englishman took the dog that year to the Scottish moors and tried him on grouse against a large field of the best dogs. Although the American setter had never seen a grouse before, he acquitted himself so well that it was admitted by all present that only one dog in the field was his equal in general work, and he did not possess the accomplishment of fetching dead game, which the American did. His owner had paid in America \$100 for him, and was offered three times that sum on the ground.

SAM'L C. CLARK

BALTIMORE, January 21, 1874.

EDITOR FOREST AND STREAM:—

I read with much interest an article in your journal on the intelligence of pointers, and thought you would not object to hearing something more on the subject, though I must tell you I prefer the setter, and I believe him to be the equal of any of the canine race.

Whilst at Cobb's Island last summer I was much struck with the intelligence of a pointer pup in the possession of one of the men connected with that famous shooting resort. Although but six months old, the dog was already a good retriever. One morning his master detected him in the act of digging most industriously at the roots of one of the trees of the island. Timber being scarce and shade a desideratum, Master Puppy was at once called off, but he returned immediately, and evinced such pertinacity of purpose that the curiosity of the bystanders was aroused, and it was unanimously agreed to let him dig. You may judge of our surprise when he unearthed some spoons, which doubtless had been hidden by one of the domestics of the hotel. The owner of the puppy immediately caused him to investigate the roots of all the trees on the island, without success, however, and was then called upon to refuse fifty dollars for the dog, which he did like a true sportsman. I can vouch for the truth of the above, but would not like to endorse the statement of one of the visitors that the would-be purchaser was from *New Orleans*.

E. S.

—It frequently happens that travelers would like to carry their dogs by rail, and the matter has been hitherto left for arrangement by fecing the baggage master, sometimes at extortionate rates, and always with uncertainty as to what the cost will amount to on a long journey over different lines. We see that regular rates have now been adopted on the road between Philadelphia and Baltimore, and the example is one that should be followed elsewhere. These prices are, for distances of fifteen miles and under, fifteen cents; over fifteen and under thirty, twenty cents; over thirty and under sixty, forty cents; over sixty and under 100, fifty cents; and 100 miles, seventy-five cents.

Shot Gun and Rifle.

GAME IN SEASON FOR JANUARY.

Moose, *Alces Malchis*. Caribou, *Tarandus Rangifer*.
Elk or Wapiti, *Cervus Canadensis*. Squirrels, Red Black and Gray.
Rabbits, common Brown and Grey. All kinds of Wild Fowl.

FOR FLORIDA.

Red Deer, *Caracus Virginianus*. Wild Turkey, *Meleagris gallopavo*.
Woodcock, *Philohela minor*. Quail, *Ortyx Virginianus*.
Snipe, Plover, Curlew, etc., in great variety.

[Under the head of "Game, and Fish in Season" we can only specify in general terms the several varieties, because the laws of States vary so much that were we to attempt to particularize we could do no less than publish those entire sections that relate to the kinds of game in question. This would require a great amount of our space. In designating game we are guided by the laws of nature, upon which all legislation is founded, and our readers would do well to provide themselves with the laws of their respective States for constant reference. Otherwise, our attempts to assist them will only create confusion.]

—We are delighted to perceive that the people of Georgia are moving in the matter of game protection in their State. The South as a section, is sadly deficient in game laws, which are especially needed at this time, when almost every gunner one meets is an irresponsible negro, delighted with his newly acquired privilege of "bearing arms," ignorant of the value and necessity of sumptuary laws, and intent the year round on filling his bag. The following is a copy of a new game law, introduced into the Georgia Legislature, by T. R. Mills, (all praise and success attend his efforts), to apply to the counties of Chatham and Bryan. We trust it may be amended to cover the whole State, with suitable special provision for the mountain district.

Section 1. *Be it enacted by the General Assembly of the State of Georgia, and it is hereby enacted by the authority of the same*, That the shooting, killing or destruction of any deer, partridge, wild turkey or wild duck, between the first day of April and the first day of October of any year, in the counties of Chatham and Bryan, shall be held and determined a misdemeanor, and shall be punished by a fine not exceeding five hundred dollars, or imprisonment in the county jail not exceeding six months, at the discretion of the court.

Sec. 2. *Be it further enacted*, Trapping of either or any bird mentioned in the preamble of this act, at any season of the year in said county, whether the same be done by the use of traps, snares, nets, or any other means, shall be punished as provided in the first section of this act.

Sec. 3. *Be it further enacted*, That the trapping or killing by any means, of any mocking birds, at any season or time of the year, shall be punished as provided in the first section of this act.

Sec. 4. *Be it further enacted*, That the fact of the possession of any bird described in the first section of this act, at any time from the first day of April to the first day of October of any year, shall be held as strong *prima facie* evidence of the fact of killing or trapping or destroying, and can only be overcome by positive proof to the contrary.

Section 5 repeals conflicting laws.

Enactments of this kind are specially needed in Florida, where it is true they would be enforced with difficulty as to pot-hunters, but might operate with some effectiveness upon venders, hotel-keepers, and market men. We are glad to see the mocking birds protected. By the cupidity of those who catch them for the high price they bring as songsters, they are in danger of being exterminated.

—The Dunn County (Wisconsin) *News* tells of a mighty hunter named Warren Young, who while hunting recently, started on a run for a herd of four deer feeding, and with a double-barrelled shot-gun killed three at twenty yards at one shot, and then brought down the fourth with the second barrel. The buck weighed 180 lbs., the doe 110; and the two fawns 75 each.

—Mr. H. G. Kelly died recently at Palmer, Massachusetts, at the advanced age of eighty-five years. He devoted much of his middle life to explorations in Oregon, and is believed to have been the first white man who ascended the Columbia river. In one of his tours of exploration, after he had been deserted by his last attendant, sick and

feeble, armed only with a long fowling-piece, he had the misfortune to fall from his horse, and break off the stock of his gun just below the lock. To be alone, ill and unarmed, among hostile Indians, many miles away from the home of a civilized being, was a condition deplorable enough. Mr. Kelly, however with true Yankee courage and ingenuity, succeeded with his jack-knife, an old buffalo horn found in the forest, and a part of the limb of a tree, in making a new breech, and attached it to his gun, rendering it as serviceable as ever. This gun he brought home with him, and a few years ago presented it with other curiosities to the museum of Amherst College, where it can now be seen. For the last twenty years he lived the life of a hermit.

—On Monday, January 21st, Sir George St. George Gore, Bart., of County Donegal, Ireland, arrived at Jacksonville, Florida, and took rooms at the Grand National Hotel, having been preceded the day before by his retinue of twenty-two sporting dogs, consisting of pointers, setters, &c., and three horses. He is bound for Manatee county, which has been highly recommended to him as a good sporting country, where he will remain some weeks. Sir George is now sixty-three years of age, having been born in 1811, and succeeded as 8th Baronet on the demise of his father in 1842.

—As Mr. Twadell and one of our correspondents were exercising their dogs not a mile from West Phila., on the 23d. inst., they noticed several flocks of purple grackles or crow black birds, and a number of robins, and on returning homeward, flushed a woodcock. The frogs had been "peeting" while the sun was bright during the day, which was noticed for its spring-like balminess. How is this for the 23d. day of January?

—We have received from Mr. W. B. Hall of Lancaster, Pa., a most simple and ingenious tool for (creasing) fastening the wad in a cartridge. Former tools for this purpose, we have always thought were lumber some and complicated. Mr. Hall's arrangement is convenience itself, and is so light and small, that it can be carried in the pocket. The tool can be held in the hand, does not require to be fastened to a table and does the work admirably. To those loading their own cartridges for breech-loaders, we should think Mr. Hall's invention would be invaluable.

BYERS, Ohio, Jan. 20th, 1874.

EDITOR FOREST AND STREAM:—

Our shooting in this section is not first rate, the brush being too thick and high and the land too hilly. Still there are occasional spots where one can get some good shooting. Rabbits, pheasants and quail are quite plenty. Last season a party of two (myself and a boy of 15 years) killed in a hunt of three days 304 quail (not shooting at rabbits or hares, as you call them) working two pointers and using muzzle-loaders. My count alone on the second day was 93 birds. This season I have not hunted a great deal, not having the time. In fact have had only one whole day's hunt, getting 54 quail and 6 rabbits; 25 of these quail I killed in the afternoon in 26 shots, missing but once.

I had half a day a couple of weeks since, and did what I call good shooting, getting 22 shots and bagging 21 quail and 1 rabbit, not missing a shot, and the birds all full grown and lusty fellows, too. H. C. S.

—Our correspondent "Homo" sends some remarkable scores in rail shooting at Port Penn, Delaware in 1873:—

EDITOR FOREST AND STREAM:

Not long since I gave you an account of our Rail shooting in the immediate vicinity of Philadelphia. Since mailing you the matter I have procured the score of a remarkable exhibit of the same shooting at Port Penn, in 1873.

Dr. E. J. Lewis has it recorded in his valuable work, that a famous week of rail shooting was enjoyed at Chester, Penn., in 1846, and gives the score in detail, and which I add to mine for sake of comparison. The September of 1846 was noted for its quantity of birds, and no season has equalled it until 1873, when Mr. Kerlin boasted 226 rail, the largest number ever known to have been bagged. Mr. J. M. Eyre, at Chester, in 1846, shot 195, and held grand "high boat" ever since, but now resigns the position in favor of Mr. Kerlin.

It will be seen the shooting at Chester covered a period of nine days, while at Port Penn the "big tides" only lasted three days, and the footings of the two scores are not wide apart by any means.

When it is taken into consideration that rail are nine times out of ten shot singly and on the wing (they never should be messed), it requires pretty rapid loading and firing to boat 150 birds in a period of three hours, each rail having to be retrieved, remember, and oft times sought for.

*Where two names occur on the score it indicates the sportsmen did not engage professional pushes but pushed and shot turn about.

**The two greatest scores ever made on the Delaware river.

†Mr. Mason was alone in his boat, and at the rising of the rail dropped his pole and shot his birds.

Port Penn is alike noted for its "excellent snipe shooting and duck shooting in the ice and can be reached both by steamboat and railroad to Delaware City, where Mr. Lord will be on hand with his wagon if desired.

"Homo."

—Wolves are unusually abundant in all parts of Canada this winter, and many persons have had narrow escapes from the varmints.

PIGEON SHOOTING.

—A Sweepstake pigeon match was shot at Deerfoot Park on January 20th; Long Island Rules; 9 entries, \$5 each; 5 birds.

Name.	Score.	Total.
Dr. Ireland	1 1 1 1 1	5
T. Broadway	1 1 1 1 0	4
Ch. Wingate	1 1 1 1 0	4
Ed. Madison	1 1 1 1 0	4
O. Townsend	1 1 0 1 0	3
W. B.	1 1 0 1 0	3
Hicks	1 0 1 0 1	3
McFall	0 1 0	1
D. Aten	0 0 0	0

Ireland won first money, Broadway, Madison and Wingate second.

Broadway, Townsend and Hicks shot off ties. Hicks missed, leaving Birdseye and L. Townsend winners of third money.

Second Sweepstakes—Same day; \$3 entrance; 3 birds each.

Name.	Score.	Total.
Broadway	1 1 1	3
C. Townsend	1 1 1	3
Dr. Ireland	1 1 1	3
C. Wingate	1 1 1	3
Ditmar	1 1 0	2
Ed. Madison	1 1 0	2
Edwards	1 1 0	2
McFall	1 1 0	2
W. Birdseye	0 0 1	1
S. Memier	0 0 0	0

Broadway, Ireland, Townsend and Wingate shared the first money. Birdseye got third money.

Madison, Ditmar, McFall and Edwards shot off first miss out. Finally McFall and Edwards shot out, leaving Madison and Ditmar the winners.

Trapping.

TRAPPING THE FISHER.

EDITOR FOREST AND STREAM:—

Of the habits and characteristics of the fisher I know but little, except by experience in trapping. They are rarely found in this vicinity, and only far back into the densest forest, shunning the haunts of man. Individuals of the species taken by me seldom exceed seven pounds in weight, and measuring four feet and one or two inches in length. Newhouse, in an early edition of his "Trapper's Guide," says it "has been seen watching for fish, lying upon a log that crosses a stream, with head inclined downwards, ready for a plunge." I think the conclusion is erroneous, and arrived at from the fact that they are prone to lie and run upon logs and fallen trees. They are great travellers, and will avail themselves of every chance to run thus. Besides, they are as loth to take to water as a fox, though frequenting the borders of streams, and prefer meat to fish in taking bait. They are gross feeders, and no meat is too stale for them. They go in pairs, and when one is taken I invariably get its mate soon in the same or an adjacent trap. If one is found by its mate in a trap it will at once kill and devour it. They are not in the least shy of a trap, and will as readily enter one as a skunk or woodchuck, but they are a powerful animal, and a trap must be a good one to hold them. When taken in a steel trap it must be set with a spring pole to swing them clear of the ground, or they will amputate their leg at once. Still, the spring pole is not reliable, as by long setting or in freezing weather it loses its elasticity. Of late years I have used a trap simple in construction, that never fails to hold them. When the trap is sprung a wire loop is forced down upon their bodies by a lever purchase with a pole, confining them so that the more they struggle the tighter it draws, and kills immediately.

The last pair taken in a steel trap afforded much enjoyment, an account of which may be of interest to new beginners. It was mid-winter that I learned by a lumberman that a fisher had crossed his road on the mountain near by. Near where the track was seen I set a large wolf trap, with spikes in the jaws, rather trusting to catching the game around the body than trust a pole, the weather being very cold. At my first visit I found a female fisher caught by a hind leg close to its body, and busily amputating its limb. It had gnawed its ham through to the bone, and was quite weak from loss of blood. I despatched her and reset the trap. On visiting it two mornings later I found it sprung and a portion of a fisher's fore foot in the jaws. It did not take long to decide what to do. It had commenced to thaw during the night, rendering the deep, light snow very soft. I retraced my steps homeward, filled a pocket with chaff, in another put a No. 1½ Newhouse trap (a favorite make), took a light axe and my five-foot Indian snow shoes, and went back to the trail. It was easy to follow from its depth and the blood. A weary tramp of two miles, often sinking knee deep, brought me to the abrupt side of a steep mountain. Faint and weary I was, but not disheartened, and after many trials to ascend, not unlike the fabled efforts of the frog in the well, I at last succeeded, and soon run in my game. At the entrance to the den I set the trap, using the chaff to bed it to prevent its freezing to the snow or settling. A moose maple grew conveniently near for a spring pole. By this time the temperature had commenced to lower, and the clouds to assume that dirty, ragged look indicative of squally weather, so, to protect the trap from being covered by snow or uncovered by the wind, I fashioned the still plastic snow into an oven-shaped roof over

it, leaving a small aperture on the down hill side, where the chain was lying. I left, feeling conscious my work was well done, which was verified three mornings later, when I took my snow-shoe trail, now solid ice, and saw at a distance my game swinging in the breeze. He was caught by the same leg, half an inch above the stump, which was fearfully swollen. He was a fine specimen, and measured four feet and two inches from tip to tip.

C. L. WHITMAN.

Weston, Vermont, January 12th, 1874.

—In reply to several inquiries, we give the following directions for improvising traps at short notice. The plan is in vogue in the backwoods of Canada. Of course any trapper who intends to establish lines for the winter, will use Newhouse's steel traps, or some more effectual devices than these given here, but these answer very well in emergencies. See "Jacobstaff's" articles on trapping, already printed in *FOREST AND STREAM*.

For a marten trap, the stump of a rotten tree, some four feet high, is generally selected, and the wood removed for a depth of two feet, the bark alone being left so as to form a shell. Logs of wood are now built up against its front, the upper log being on a level with the surface of the solid portion. On this log, and in front of the recess, a small upright three or four inches in length supports another log, on the extremities of which several pieces of timber rest. The bait, consisting of a bit of salt fish or wing of a duck is fixed to a pointed stick projecting into the recess, one end underlying the upright, which will fall at the lightest pressure. The marten in his runs through the woods scents the bait, and endeavoring to reach it, squeezes through the open space between the two horizontal logs, the upright falls, bringing with it the upper log, which, pressed down by the balks resting in its extremities, either kills the marten at once, or else keeps him tightly jammed till the next visit of the trapper.

The otter traps are constructed on much the same principle, save that whereas the marten trap is placed at random through the woods, the hunter must first ascertain where the otter is in the habit of rolling himself, (always near the bank of the river), and build his trap on that spot. No bait is required. Two logs, four feet in height are then driven firmly into the ground about two feet apart, and connected at the top by a cross piece; logs are then placed against the uprights to a height of two feet, as in the marten traps, and a small branch is next chosen, hooked at one end the hook passing over the cross piece at the top, while the lower end is carefully adjusted behind the upper log of the lower series. A cord attached to the hook keeps in suspense a horizontal log, on the extremities of which balks of timber rest. The otter in rubbing himself must press against the hooked upright, the bottom end, nicely balanced, tips up, and the leverage being removed, the cross piece which the hook supports falls on the otter with the additional weight of the timber resting on its extremities.

Rational Pastimes.

Will our University correspondents kindly send us their most recent catalogues.

—The first days skating of the season at Central Park occurred on Jan. 20th, for a few hours. On the 26th the Park lake presented a very gala appearance. There was skating at Prospect Park the same days, and also at the Capitoline lake and the Union pond. Owing to the sad accident which occurred at the little corner lot pond, on Seventh street and Sixth avenue, on Saturday last, by which three young boys were drowned, the Police have prohibited boys from going on the same class of ponds, and very properly so too.

—The Curlers were out in force at Prospect Park, on Jan. 26th, on which day the Thistle and Caledonian clubs played a medal match together, which resulted in the latter club by the appended score:

CALEDONIAN.		THISTLE.	
Jas. Nicall (skip).....	20	A. Robertson (skip).....	22
A. Kellogg, (skip).....	25	J. Gallaway, (skip).....	20
Total,.....		Total,.....	
45		42	

This necessitates a third match, as the Thistles won the first.

—The grand match, "North vs. South," for the Dallymple medal, took place at Central Park, on Jan. 27th, when the clubs of New York, Brooklyn, Jersey City, Patterson, Yonkers, &c., took part in the contest, the scene presented at the lakes being lively in the extreme.

—Ice-boat sailing was indulged in both at Prospect Park and at the Capitoline Lake, on January 26th and 27th, the "Lady of the Lake" and the "Iceicle" sailing together at the Park Lake, and the "Fly Away" at the Capitoline Lake. All three boats are to race for the Park Pennant the first day that the ice at the large lake completely covers its surface; it is not safe until then. An experiment was tried with the "Lady of the Lake" to see how she would act in the water, and on her going off the ice she went to the bottom in lively style.

—The Hudson River Ice Boat Associations took to the rivers on Jan. 27th with their boats, the Hudson being fast frozen from Newburg to Troy. Some fast sailing was had, and if the cold weather continues, the annual regatta will take place this week.

—The contest for the Governor General's cup, open to all skaters in the Dominion, comes off next month in Montreal.

—A book on athletic sports, of three or four hundred pages, is soon to be published at McGill University, Canada.

—The Mutual Base Ball Club (professional nine) have selected their nine for the coming season, which will comprise the following well known players: Matthews, pitcher; D. Allison, catcher; Start, first base; Nelson, second base; Cary, short stop; Burdock, third base; Hatfield, left field; Remsen, centre field; and Higham, right field.

BILLIARDS.

—Maurice Daly, while in New Orleans, enjoyed himself exceedingly. He returns his sincere thanks to his kind host, Col. Merriam, and other numerous friends there.

—Col. Merriam, proprietor of the Crescent Hall Billiard Rooms, is ornamenting his handsome club rooms with portraits of the leading professional billiard players of America.

—M. Ubassey has returned from Philadelphia, after giving several successful exhibitions there. He has settled down to steady practice for his match with Garnier next Friday, and may be found about every afternoon practising with Maurice Daly, at the latter's billiard rooms, Union Square.

—R. E. Wilmarth, ex-champion of Massachusetts, is located at the Spingler House Billiard Rooms. Last week, at these rooms, Mr. W. E. W., an amateur, while playing pool pocketed the fifteen balls twice in succession.

—John W. Bessunger has arrived in town from Chicago and is giving Garnier practice for his match with Ubassey.

—Joseph Dion is expected in town this week from Montreal.

—Edward Daniels, of Boston, is expected here this week.

—Col. Merriam, of New Orleans, is inaugurating a tournament for the amateur championship of Louisiana; it will commence on March 1st.

—Much interest is manifested in the championship match to be played next Friday evening at Tammany Hall between Messrs. Garnier and Ubassey. Garnier is the favorite. Both are playing well in practice.

—The billiard match between Daly and Maggioli, in New Orleans, resulted as follows: Game, 300 points up, Daly giving the odds of a discount; played on a 5x10 Griffith table; time of game, 1 hour and 35 minutes.

Points made—Daly, 292; Maggioli, 121.

Largest runs—Daly, 18, 26, 37, 40; Maggioli, 13, 17, 24, 25.

Average—Daly, 10 2-29; Maggioli, 4 5-29.

Won in twenty-nine innings.

—The billiard match at New Orleans between Messrs. Daly and Miller, the latter receiving the odds of 100 points in 300 up, French carom game, resulted in Mr. Daly's winning by a score of 300 points in nineteen innings, to Miller's 97. The play throughout, on Mr. Daly's part, was remarkable.

Daly, 300 points; Miller, 97 points.

Largest runs—Daly, 40, 51, 62, 67; Miller, 12, 13, 19, 27.

Average—Daly, 15 15-19; Miller, 5 2-19.

BROOKLYN, January 24th, 1874.

EDITOR *FOREST AND STREAM*.—

Seeing in your issue of the 22d a report of the proceedings of the Convention of Amateur Base Ball Club representatives of December 17th last, in which reference is made to the new rule of ten men and ten innings, as also some comments on the advisability of limiting the delivery of the ball to a legitimate pitch or toss, and of prohibiting the present underhand throw in delivery, I thought it advisable to explain some facts in relation to the new rule of play, and especially in regard to underhand throwing, with a view of enlightening the minds of those of the amateur fraternity, who appear to be rather in a fog on the subject, judging from the comments of your correspondent, "Champion."

The experiment of ten men in the game was successfully tested in a series of prize games played in Brooklyn ten years ago, at a time when the same opposition was made to my plan of the "fly game"—as it was then called—as against my rule of ten men and ten innings now. A singularity of this opposition is, that it comes chiefly from those who have never seen the game played, and whose objection is simply based on the old theory of "the game suited my father, and it therefore suits me."

In reference to the effort to reintroduce the rule prohibiting any method of throwing the ball, your correspondent advocates the return to a rule which has for twelve years past been a dead letter law. Underhand throwing has practically been the rule of delivering the ball swiftly to the bat in base ball since the advent of Creighton, who was the first man to introduce it. Moreover, it is the only style of delivery which combines speed with command of the ball. Even if a square pitch was capable of being correctly and easily defined under the existing rules of punishing a wide delivery, no pitcher could deliver a ball by a square pitch with any degree of speed, and not pitch it wide every second or third ball; and if confined to an accurate delivery, and thereby forced to toss the ball to the bat, the result would be such facilities being offered the batsman for making home run hits as to deprive the game of all the opportunities offered for skillful fielding which it now presents. Instead, therefore, of the rule of limiting the delivery of the ball to a square pitch or toss affording chances for sharp fielding the very adverse would be the case, as the experience of past years fully proves. But the fact is the difference in the form of delivery in swift pitching and in a well disguised underhand throw is so difficult to detect, owing to the quickness of the movement, that constant disputes would occur from the diverse opinions of umpires; and even were they able to distinguish easily, and square pitching was made the rule, the result would merely be a return to the tedious and boyish style of play, of home runs, large scores, and long, weary games in the place of such displays of fielding skill as that exhibited on

the occasion of the fourteen innings, swift underhand throwing delivery game between the Philadelphia and Atlantic clubs, marked by a score of three to two only. Young amateurs of the present day forget that the New England game of base ball of twelve years ago prohibited any style of delivery except the swift *overhand* throw. With a square pitch the chances for skillful fielding are diminished one half, and as for batting, the veriest "ruffer" at the bat could punish such a delivery with ease. Such pitching may suit country village clubs, who go in for heavy batting and large scores, but for really skillful ball tossers the underhand throw delivery affords the only chance for masterly fielding and strategic play, both on the field and at the bat. It has been the rule for the past twelve years, despite the dead letter law which "Champion" desires to see replaced on the law book of the game.

Respectfully yours,

HENRY CHADWICK.

["Champion's" letter of 26th instant is crowded out, but will appear in our next issue.]—ED.

Fish Culture.

—Our readers who are curious on these points, are here-with informed that the salmon of the Pacific coast, or rather of the Sacramento tributaries, are now spawning. This is the busy season of the Fish Culturists on the far western slope.

—Thirty thousand salmon fry from the Sacramento river were last week placed in the streams watering the middle portion of Suffolk county, Long Island. Thirty thousand have also been placed in the Upper Potomac, and Opequan river, and Cedar Creek, Virginia. We published some time since from Livingston Stone, Esq., a full history of the capture and transportation of these fish from California to the hatching houses of Dr. Slack, at Bloomsbury, New Jersey.

—The stock of salmon eggs at Bucksport, Maine, continues in good condition and will soon be distributed. The total loss by death thus far is about three per cent. of the eggs originally taken, about 2,250,000 being now on hand. These all belong to the National Government and to the several States that have aided the enterprise; but it is the intention of Prof. Baird to supply spawn to private parties who may want it, at a low price, as announced in our advertising columns.

—Seth Green, the indefatigable fish culturist, desires us to publish the following card:

ROCHESTER, January 20, 1874.

EDITOR *FOREST AND STREAM*.—

I stand ready to answer any questions that may be asked me through the *FOREST AND STREAM*, about fish, lakes or streams; but the real name must be signed by the writer. Yours, truly, SETH GREEN.

Mr. Green renews his offer to furnish salmon, black bass, whitefish, perch, pike, etc., gratuitously, to all applicants within the State, in accordance with his circular already published in all the newspapers.

BUCKSPORT, ME., January 20, 1871.

EDITOR *FOREST AND STREAM*.—

Your remarks in your issue of the 15th inst., on the prevalent mild weather and its influence on fish hatching and rearing, suggest two or three inquiries.

1st. Has the temperature of the water used for hatching salmon and trout in the Middle States been raised by the recent mild weather? Fish breeders who take observations can answer. Here in Maine the tendency is the reverse. A thaw in winter depresses the temperature, probably by bringing in a larger proportion of snow and ice water. The coldest water we had last season was in April while the ground was thawing and ice melting in the ponds. After the thawing is completed of course the continuance of warm weather raises the temperature of the water.

2d. What effect has a freshet on spawn of salmon or trout deposited in the natural way? I have heard persons who knew much about the habits of salmon and something about breeding them, assert their belief that were it not for the action of freshets in tearing open the salmon ridds or nests, the young salmon would never succeed in getting out from the heap of gravel that the careful mother throws over them. If the liberation of the embryo fish does not occur in this way, who can tell how it does occur? But perhaps our knowledge of the structure of the salmon's ridd, and of the position of the eggs in it, is too meagre to warrant us in attempting the proposed explanation. Who among your readers has ever examined a ridd thoroughly, from end to end, from top to bottom, so that he knows just where the eggs were? If any one has made such observation he can confer a favor on naturalists by his discoveries.

I see that "Fern Fly's" criticisms on Professor Baird's choice of streams for the deposit of salmon spawn have been well answered by several correspondents, but I will add my mite. I have written many letters of inquiry to parties living near the Black and Oswegatchie rivers and the statements thus far elicited tend to the conclusion that neither of them was ever largely frequented by salmon; while the testimony is abundant and conclusive that they were found in Salmon and Oswego rivers in great numbers. If any of your readers will give me items of information about salmon in any of the tributaries of Lake Ontario and the St. Lawrence, particularly the Black, Oswegatchie, Rackett and St. Regis rivers, they will place me under great obligations.

CHAS. G. ATKINS.

Late Fish Commissioner.

THE LEIPSIK FUR TRADE.—The report of the Leipzig Easter Fair of 1873 has been published. To this fair is brought the furs of the whole world. Furs are exported from the purchases made at this mart all over the globe again, though no small quantity remains for consumption in Germany. At Leipzig last year, coming from Europe alone, 120,000 foxes, 200,000 polecats, 50,000 rock martens, 20,000 pine martens, 20,000 badger skins, 6,500 otters, and 125,000 black cats were sold. Of Russian and Siberian skins, 2,000,000 of squirrels found a ready market, with 160,000 ermine and 8,000 Siberian sables. Russia bought up, coming from North America, 1,800 sea otters and 80,000 beavers. Of bear skins, 6,000 of them went to make shakos, while 220,000 racoons were of slow sale. Skunk skins, some 950,000, were dull, and moved off slowly. Eight hundred silver foxes and 3,500 cross foxes were on hand. Of red foxes, 45,000 were on hand, which were taken up by Russian, Greek, and Gallician buyers. Of musk rats there were only 2,500,000, and prices were high, owing to the possibility of a diminished supply from America. Otters, though, were in full quantity, to the total of some 60,000. General prices were mostly lower for staple furs this last year, owing to the mildness of the winter in Europe.

CANADIAN FISHING SPORT vs. SLAUGHTER.

EDITOR FOREST AND STREAM:—

Pressure of office business has prevented me from sooner noticing a courageous paragraph in *FOREST AND STREAM* of 30th October last, relative to trout fishing at Nepigon river. Canadians and Americans alike should feel thankful for the outspoken information which it contains. Accept my thanks. It is our interest to know of and your interest to publish such abuses. We spend public money and maintain officials to protect and improve our angling streams. We welcome to them those neighbors who appreciate our outlay and respect our fishery laws. But we might be compelled to restrict or withhold this freedom, if their manner of exercising it should become onerous to ourselves or injurious to others. If, therefore, any American anglers admitted to these privileges commit wasteful excesses, such as that described, it is the true interests of others to avert universal discredit and obviate general exclusion by exposing them.

The cases of Mr. Avery and others of like character, are now under investigation, and the particulars received from the local fishery officers will be duly published in our own reports.

It has been for several seasons past the habit of strangers visiting trout streams on the north shores of Lakes Huron and Superior, on angling excursions, either to pickle down their catch of speckled trout, or to bury or burn them about the camping places. The former practice, though apparently objectionable, admits of qualifying circumstances; the latter is simply inexcusable. Both may, but do not necessarily indicate a disposition at variance with the instincts of a genuine sportsman.

Although some may think it only a sporting conceit, it is with many a cherished principle to kill no game that cannot be used or saved. When myself tempted by nature to wantonly destroy wild animals, or prompted by rivalry to slaughter game according to the arithmetic, I confess that resistance is difficult. But there is a noble satisfaction in the active, self-denial imposed without any reference to the humanities. It is easy enough to perceive practical difficulty in which an angler would be placed who catches more fish than he can dispose of at once, unless he be left at liberty to pickle or otherwise preserve them. Certainly if a fisherman cannot utilize them on the spot, or deport them for use elsewhere, he ought on no account to catch them at all. They are not vermin. There can be no doubt about the gratification of consuming at home and distributing among friends the fruits of our sporting skill or opportunities. And it must be allowable to provide for thus imparting to others the secondary delight of our own enjoyment. How shall the liberty be kept within reasonable bounds? That's the question. It seems after all to rest with the generous discretion and good taste of sportsmen. If they could content themselves with moderate sport and eschew the competitive fashion of hunting and fishing merely to excel in weight and numbers, I think that such an example would soon win adherents, and discourage a prevalent system of gentry poaching, such as amongst ignorant barbarians would be stigmatized as destructive, and thought deserving of penal correction. Probably the initiatory step is that of exposing those insatiable destroyers who shoot and fish to gratify a momentary and vain selfishness, or to satisfy an ignoble desire for notoriety. But the wretched barbarism of men who not only destroy excessive quantities, but abandon them to waste, cannot well be shamed by exposure. The only remedy in similar instances, so far as concerns Canadian waters, seems to lie in a discriminate exclusion. In another letter I will explain how this can be accomplished.

Candor impels me to own that United States citizenship cannot claim a monopoly of sportsmen of the Nepigon type. I have in my mind's eye at the present moment two other notable and very recent examples of the salt and offal class of sportsmen—a Canadian "Honorable" and a British "Baronet." The former gentleman as a guest on the Restigouche river, last summer, killed and salted down—body, bones and all—presumably for the Toronto market—about 21 barrels of salmon. The latter gentleman, also a guest at the River Saguenay, last autumn, amused himself by killing quantities of different kinds of fish with an amateur trap net, and left most of them to rot.

Are these examples from such distant places as Lake Superior, Chaleur Bay and the Saguenay calculated to commend the interests of the sporting fraternity to the sympathy of the general public, either in Canada or the United States? If not, then the perpetrators should be discontinued and exposed with unsparing impartiality. W. F. WHITCHER.

Ottawa, Canada, 16th January, 1874.

—We are fortunate in having upon our list of contributors such worthy and intelligent co-adjutors as Messrs. Whitcher and Venning, the Canadian Inspectors of Fisheries, letters from both of whom, and from the latter frequently, have appeared in the columns of this journal. We appreciate the sympathetic tastes and community of interests which draw such gentlemen as these to our side, but we especially value coöperation from over the border with our own efforts here, because it is only by an earnest and strong pull both together that we can hope to correct abuses, instruct the unlearned in this new dispensation, and re-populate our forests and streams. The popular mind is sufficiently alive to the importance of these great interests to lend a willing aid, if it be only directed aright, and we know that letters of such practical men as we have named, with Baird, Green, Norris, Mather, Stone, Atkins, Stillwell, and others, such as we publish from week to week, must have great weight in moulding that popular mind, and so utilizing popular force as to make it available in working out the grand result desired. It is no ungenerous and invidious reflection upon Canadians or Americans, that even the idea of a "discriminate exclusion" has suggested itself to Government officials as the surest, best and quickest remedy for existing evils.

It may be mortifying to the pride of men conscious of wrong doing to be debarred from the privileges of the streams; but it will not wound them half so much as to be caught in the offence by and by when the public shall become educated to an intelligent understanding of the true and abstract nature of the offense. We believe that opposition and hostility to game and fishery laws lies in great part in ignorant misapprehension of their intent and application; but where mere cupidity is the incentive to violation, punishment ought not to be condoned. If Mr.

Whitcher can, as he promises, demonstrate what remedy will be effectual, he will accomplish something worthy of gratitude. We shall await his supplementary letter with curiosity.

—The catch of herring on the northeast coast of France is exceedingly abundant this year. During the first week of January an enormous quantity of herring were placed on the Dieppe market, the number of fish in a single day taxing the energies of the fishermen to bring to the land. The oldest fishermen declare that the yield of herring has been greater at the present season than at any preceding period.

—A private letter states that the veteran angler, Thad. Norris, Esq., is presently to start a large fishing tackle and rod factory at Philadelphia. His rods are very highly prized by many anglers, though different persons have their favorite makers.

—Herrings are reported to be plenty at Grand Menan. Cod, pollock and haddock are also said to be more numerous there than they have been for the last forty years. American vessels are taking large quantities of fish. One of them caught a full load in ten days, having caught 18,000 pounds in one day.—*Cape Ann Advertiser*.

—Col. Nicholas Pike, late U. S. Consul at Mauritius, mentions having caught an eel there which measured twelve feet three inches in length, and fourteen and a half inches around the largest part of the head.

✓ **PREPARING SALMON ON THE COLUMBIA RIVER.**—Along a part of the Columbia river (below Kalama), are the "salmon factories," whence come the Oregon salmon, which, put up in tin cans, are now to be bought not only in our Eastern States, but all over the world. The fish are caught in weirs, in gill nets, as shad are caught on the Hudson, and this is the only part of the labor performed by white men. The fishermen carry the salmon in boats to the factory—usually a large frame building erected on piles over the water—and here they fall into the hands of Chinese, who get for their labor a dollar a day and their food.

The salmon are flung upon a stage, where they lie in heaps of a thousand at a time, a surprising sight to an Eastern person, for in such a pile you may see fish weighing from thirty to sixty pounds. The work of preparing them for the cans is conducted with exact method and great cleanliness, water being abundant. One Chinaman seizes a fish and cuts off his head; the next slashes off the fins and disembowels the fish; it then falls into a large vat, where the blood soaks out—a salmon bleeds like a bull—and after soaking and repeated washing in different vats, it falls at last into the hands of one of a gang of Chinese whose business it is, with heavy knives, to chop the fish into chunks of suitable size for the tins. These pieces are plunged into brine, and presently stuffed into the cans, it being the object to fill each can as full as possible with fish, the bone being excluded. The top, which has a small hole pierced in it, is then soldered on, and five hundred tins set on a form are lowered into a huge kettle of boiling water, where they remain until the heat has expelled all the air. Then a Chinaman neatly drops a little solder over each pin-hole, and after another boiling, the object of which is, I believe, to make sure that the cans are hermetically sealed, the process is complete, and the salmon are ready to take a journey longer and more remarkable even than that which their progenitors took when seized with the curious rage of spawning, they ascended the Columbia, to deposit their eggs in its head waters, near the centre of the continent.

I was assured by the fishermen that the salmon do not decrease in numbers or in size, yet, in this year, 1873, more than two millions of pounds were put up in tin cans on the Lower Columbia alone, besides fifteen or twenty thousand barrels of salted salmon.—Charles Nordhoff, in *Harpers Magazine*.

—The following is a list of the Fishery Commissioners for the several States as far as yet appointed:

United States—S. F. Baird, 918 New York avenue, Washington, D. C., Commissioner General.
Maine—H. O. Stanley, Dixfield; E. M. Stillwell, Bangor.
New Hampshire—Thomas E. Hatch, Keene; W. W. Fletcher, Concord; W. A. Sanborn, Weirs.
Vermont—M. C. Edmunds, Weston; M. Goldsmith, M. D., Rutland.
Massachusetts—T. Lyman, Brookline; E. H. Brackett, Winchester; Thomas Talbot, North Billerica.
Connecticut—W. M. Hudson, M. D., Hartford; R. C. Pike, Middletown; J. A. Bill, Lyme.
Rhode Island—Newton Dexter, Providence; A. A. Reid, Jr., Providence; I. H. Barden, Scituate.
New York—H. Seymour, Utica; R. B. Roosevelt, New York City; E. M. Smith, Rochester.
New Jersey—B. P. Howell, M. D., Woodbury; J. H. Slack, M. D., Bloomsbury; J. R. Shotwell, Rahway.
Pennsylvania—J. Duffy, Marietta; H. J. Reeder, Easton; R. L. Hewitt, Holidaysburg.
Virginia—William Ball, Mid Lothian; Asa Wall, Winchester.
Alabama—C. S. G. Doster, Prattville; D. R. Handley, Mountain Home; Robert Tyler, Montgomery.
Michigan—Gov. J. J. Bagley, Detroit; G. H. Jerome, Niles; G. Clark, Ecorse.
California—R. B. Redding, San Francisco; S. R. Throgmorton, Sacramento; J. D. Farnell, Sacramento.

The Commissioners will favor us by forwarding their reports.

COMMITTEE ON THE LEGISLATION NECESSARY FOR THE PRESERVATION OF OUR FORESTS.—The following gentlemen, members of the American Association for the advancement of science, met on Saturday last in this city, for the purpose of organization, and to impress the necessity of preserving our forests. All the names below are those of gentlemen who have been prominent in measures of this character, and combine the fullest practical and theoretical knowledge in regard to trees, their influences on soil, and the effects of forests on climate &c.

Dr. F. B. Hough, Lowell, N. Y.; Prof. Asa Gray, of Cambridge; Hon. Geo. B. Emerson, of Boston; Prof. W. D. Whitney, of California; Prof. W. H. Brewer, of Yale; Prof. John S. Newberry, of New York; Col. Chas. Whitteley, of Cleveland, Ohio; Hon. L. H. Morgan, of Rochester; Prof. Hilyard, of Ann Arbor, Michigan.

Yachting and Boating.

All communications from Secretaries and friends should be mailed not later than Monday in each week.

HIGH WATER, FOR THE WEEK.

—Gen. W. W. Sanford of St. Louis, expects his new schooner to "go into commission" on the first of April. She will be launched from the yard near Baltimore, about that time. He contemplates a cruise to Baltimore, Fortress Monroe, Washington, Richmond and perhaps further South, expecting to arrive in New York about June 15th, in time for the opening of the season here. He will then undoubtedly be ready to try conclusions with some of our fast ones here.

Pat. McGlehan, the celebrated yacht builder, has three yachts on the stocks, all sloops. One twenty-two feet, over all, for South Carolina waters. One twenty-four, over all, for Lake Mahopac cruising. One forty-five feet, over all, for the New York Bay. We are glad to see our Southern friends taking an interest in yachting again. It looks like old times.

CONVENTION OF THE ROWING ASSOCIATION OF AMERICAN COLLEGES.

[From our own Special Correspondent.]

HARTFORD, CONN., January 23, 1874.

EDITOR FOREST AND STREAM:—

Wednesday, 21st instant, the Rowing Association of American Colleges met at the Allyn House, in this city, to decide where the regatta next summer should take place. Delegates were present from the following colleges:—Amherst, G. E. Brewer, F. W. Whitridge; Bowdoin, E. Gerry, Jr., G. F. Harriman; Columbia, J. K. Rees, F. D. Shaw; Cornell, J. F. Southard, J. F. Cluck; Dartmouth, W. J. Eaton, J. S. Aiken; Harvard, R. H. Dana, Jr., Wendell Goodwin; Agriculturals, E. P. Chandler, J. M. Benedict; Trinity, J. D. McKennon, W. Stark; Williams, J. Gunster, C. B. Hubbell; Yale, R. J. Cook, C. H. Ferry.

It was voted that this meeting take the place of the regular annual meeting, and Princeton, with A. Marquand and D. Nicoll, and Wesleyan, with J. P. Stowe and D. Dorchester, Jr., as delegates, were regularly admitted to the Association.

Nomination of officers then took place, and resulted in the election of J. H. Southard, Cornell, President; Vice President, R. H. Dana, Jr., Harvard; Secretary, J. K. Rees, Columbia; Treasurer, J. Gunster, Williams.

A motion to change the name of the Association, and call it the "Rowing Association of New England Colleges," and to admit Columbia, Cornell, and Princeton as members, was made by Aiken, of Dartmouth. It was opposed by Cook and Ferry, of Yale; Cluck, of Cornell; Rees, of Columbia; and Gunster, of Williams. Dana, of Harvard, was in favor of it.

A resolution offered by Cluck, of Cornell, seconded by Ferry, of Yale, to the following effect, was passed:—

Resolved, That the constitution be amended so as to read amendment 2:—Undergraduated students of colleges, members of this Association, candidates for the degree of A. B., Ph. B., or such other degree as represents a parallel or similar course of study, with the exception of those who are candidates for the degree of L.L.B., or M.D., or B.D., shall be eligible to the regatta crews of this Association, and it shall be understood that the term undergraduates shall mean all students candidates for such degrees as are mentioned above, with the above exception, but who shall not yet have received any degree."

Here Yale came in antagonism with Yale on this question. Goodwin thought that something underhand was meant by excluding the Harvard law students who were studying for a degree. Dana spoke to the same effect. Ferry, of Yale, said the idea was to secure men of approximately the same age.

On a vote the yeas were:—Bowdoin, Cornell, Columbia, Agricultural, Trinity, Yale, Wesleyan, Princeton. Nays—Amherst, Dartmouth, Harvard, Williams. This finished the morning session.

In the afternoon Hubbell, of Williams, opened the debate by moving the next regatta be held at Saratoga. Mr. J. P. Conkling, President of the Saratoga Rowing Association, was allowed to take the floor and give his views on the merits of Saratoga Lake. It must be said that Mr. Conkling handled his subject in a manner which did him infinite credit, and, fortified with facts and figures, he made a most favorable impression. He deprecated the sectionalism of Harvard, and the bias of New England generally, against Saratoga. "If we are frauds, scourge us through every newspaper in the land," said Mr. Conkling.

The course, shown on a plan of the lake by Mr. Conkling, is three miles straight, narrow near the finish, and visible from many points over its whole length.

His speech was loudly cheered, and a lively discussion followed it. Brewer, of Amherst, said many of his college were opposed to Saratoga on account of the cost. Rees, of Columbia, favored Saratoga, also Hubbell, of Williams. Shaw, of Columbia, said the morality question was settled by the promises of the Saratoga committee, and, at any rate, for some colleges Saratoga would be cheap.

than Springfield. Whittridge, of Amherst, didn't put any faith in contracts. He thought the representatives of the colleges of the best part of America should not put themselves under the control of the blacklegs of Saratoga. Rev. Mr. Twitchell, of Hartford, was allowed to express his views, which were opposed to Saratoga. It would be found that the selection of Saratoga would be a bad thing, and tend to break up the Association. Goodwin, of Harvard, spoke in favor of New London as very accessible, and salt water as a great improvement over fresh water, hot summer resorts. Cook, of Yale, wanted a fair race, and the best place was the best course. He did not want to work a year and then lose all by a foul. He believed in taking the course out of New England if necessary, and the morality of the men depended on themselves. Dana, of Harvard, spoke in favor of New London. Finally, it was voted to row the race at Saratoga, and to refuse any of the money or prizes offered by the Saratoga Association, or by anybody except the College Association itself. The vote for Saratoga was: Yeas—Bowdoin, Cornell, Columbia, Agricultural, Trinity, Yale, Williams, Princeton, Wesleyans. Nays—Amherst, Dartmouth, Harvard.

After the vote, Mr. B. F. Brady returned thanks on behalf of the Saratoga Association.

Two sets of flags, same as last year, were voted to be bought for the winners of the University and Freshmen races, and that the maker agree to subsequently inscribe thereon the names of the winning crews in order and their competitors. It was ordered that the flags be not presented until the official decision of the referee is made. A pamphlet was ordered printed giving the history, so far, of the Association. A motion for a pair-oar race was lost.

It was voted to have a committee of three delegates of the competing colleges take charge of the regatta, these three to be selected by a committee of delegates, each naming a man, and reduced to three by a marking list. The regatta committee was instructed to devise a plan to distinguish the boats in a race.

The race was fixed for July 16th, 1874, and the following is the preliminary regatta committee:—Amherst, Brewer; Agricultural, Benedict; Columbia, Thompson; Bowdoin, Harriman; Cornell, Randall; Wesleyan, Dorchester; Yale, Cook; Dartmouth, Aiken; Trinity, McKennon; Harvard, Appleton; Princeton, Nicoll; Williams, Hubbell. Each college was instructed to send its rowing statistics to the Secretary before the next meeting, which will be in Springfield in January, 1875.

It was not supposed that Saratoga would be selected by such a large majority of the Association, but after all, the Saratoga Rowing Association laid their plans well, and were well represented by a generous, whole souled deputation, who were not backward in enjoying and making all concerned participate in all the delicacies of the season, solid and liquid. However, if their promises are carried out, it is not probable that the colleges will regret their choice.

The subject of a four-oared race was not touched upon at all, though it is probable a few years hence that four-oared races will supercede the all-prevailing six-oared races of the present day among colleges, as such is the individual expression of a good many now.

A movement is also on the boards for a grand inter-collegiate oratorical and literary demonstration, to take place at Saratoga with the July regatta, and is meeting with much favor. If carried out as suggested it will be highly popular. * * * LATER.—On Saturday there was a full meeting of the Amherst Boating Club, when it was unanimously resolved that the holding of the regatta at Saratoga would be prejudicial to the interests of the rowing associations in general, and particularly of Amherst, and accordingly, that Amherst will not row at Saratoga. It is probable that the class regatta will take place at Hatfield, on the Connecticut River, during commencement week. There seems to be quite an amount of feeling, not fully appreciated at Hartford, which is now developing itself at Harvard, in regard to the selection of Saratoga as the place of contest. I do not think the professors of the leading colleges are very much pleased with the ground selected. I am not prepared to state whether they have not very good reasons for withholding their sanction. The matter is by no means to be considered in the least as reflecting on the generous conduct of the Saratoga Rowing Association. If a distinction is drawn, it is more against the place itself and the increasing prominence Saratoga is taking as a sporting resort in the worst acceptance of the name. Of course we all regret that there should be any differences, but they certainly do exist.

W.

PRINCETON, N. J., January 26th, 1874.

EDITOR FOREST AND STREAM:—

Princeton has at last been aroused from her lethargy in boating matters; the preliminary steps in this respect were taken on Wednesday, January 21st, when delegates were sent to the Convention of College boating men. This is a new era in the history of Princeton athletic exercises, and we hail it with unbounded delight. We feel that what Princeton undertakes to do, that she accomplishes in the most satisfactory and commendable manner. We do not anticipate victory at the outset, but victory shall be the goal towards which our most strenuous efforts, from this time, will be directed, and which, when the great vantage ground now possessed by the other colleges shall have been gained by Princeton's indomitable perseverance, we will then strive to attain, and when so attained our history of the past proves our ability to maintain. Not with boating matters have we ever been identified, but the excellence

which we have achieved in wielding the ash, and the victory we have gained in football, and our indisputable success in ever keeping fresh the laurels which we have won, warrant our present *debut* upon the water, and we feel that our representatives will reflect credit upon themselves as well as their Alma Mater.

Owing to the depletion of our treasury, circulars were sent last week to the graduates and friends of the College, since which time various sums of money have been received. Among our receipts, we cannot refrain from noting that of a check for \$2,000 from Robert G. Bonner, of New York city, for the construction of a boat-house, a building which, for a long time, we have stood sorely in need of.

May this munificent contribution prove the "star in the east," and may many who are interested in Princeton's successes follow it, and by their influence initiate a pilgrimage, so that when this luminary shall have stood over Princeton's training ground, the canal, "frankincense and myrrh" may be freely bestowed.

"CHAMPION."

NEW HAVEN, CONN., January 26th, 1874.

EDITOR FOREST AND STREAM:—

Boating items at New Haven are quite lively. *Imprimis*, the Yale Boat Club will change the locality of their boat house. It is questionable as yet where the new house will be erected, but Mr. Ferry, the President, and Capt. Cook are carefully studying up the matter. Whitney Lake was first thought of as a convenient place, but at last it has been decided, and the Mill river site on the Fair Haven side of the harbor, near Chapel Street Bridge, has been pitched upon. Something substantial is thought of as to the construction of the house, a foundation of stone with a neat wooden superstructure. The Collegiate Professors have taken a proper interest in the matter, and it is hoped that the money necessary for the undertaking will be furnished. It would be most desirable that the boat-house should be finished at an early season, as there is nothing more disagreeable than for a boating crew to get into training without some proper attention being paid to their creature comforts. There is every reason to suppose that the season of 1874 will be a most active boating one. A great many excellent men are anxious to be included in our University crew. As yet it is too early to determine who will be the lucky ones, but it looks as if J. Kennedy, G. L. Brownell, C. N. Fowler, C. B. Rockwood, M. G. Nixon, and F. Wood would be in the winning boat. If Yale should win, of course Capt. Cook is included. We have hopes of getting early at work next season. THOLE.

—The Yale University crew has been selected, and is practicing daily in the college gymnasium. The crew at present consists of Cook and Fowler, '76; Kennedy, Brownwell, Wood and Nixon, of the Scientific School.

—The following doggerel, which we take from the London *Field*, is quite good, and might be of use to our yachtsmen in preventing a collision:—

When both side lights you see ahead,
Port your helm, and show your red;
Green to green, or red to red,
Perfect safety, go ahead.

If to your starboard red appear,
'Tis your duty to keep clear;
To act as judgment says is proper,
To port or starboard, back or stop her.

But if upon your port is seen
A steamer's starboard light of green,
There's not so much for you to do,
For green to port keeps clear of you.

Both in safety and in doubt
Always keep a good look out;
In danger, with no room to turn,
Ease her, stop her, go astern.

New Publications.

[Publications sent to this office, treating upon subjects that come within the scope of the paper, will receive special attention. The receipt of all books delivered at our Editorial Rooms will be promptly acknowledged in the next issue. Publishers will confer a favor by promptly advising us of any omission in this respect. Prices of books inserted when desired.]

FANNY FERN. A memorial volume, containing selections from her writings, and a memoir. By James Parton. With illustrations. N. Y.: G. W. Carleton & Co.

Of this gifted authoress it is pleasant for us to speak. It was our good fortune to have personally known "Fanny Fern," and in speaking of this memoir by James Parton we do not intend to go into a lengthy literary criticism of a work that will, like others containing her brilliant thought, short, caustic home truths and gems by the way, be like them another household treasure, added to those which have gone before. Jas. Parton has done only simple justice to the great literary ability of Sara Willis. And the Carletons have placed this valuable work before the public in an elegant and substantial form.

GAZETTEER OF THE STATE OF MASSACHUSETTS. By Rev. Elias Nason. Boston: B. B. Russell.

This work is the last and most concise work published. Her citizens have long felt the want of a correct and reliable gazetteer of the Old Bay State. There is a real freshness about this record of the past and the present that is not lessened by its minuteness of detail, its pictorial illustrations and a general fullness of historical and statistical notices and facts. Our friends will understand when we speak of this work we are not romancing over the pages of a novel. We are talking sober prose over a State gazetteer; yet it is a live book and full of the very poetry of fact. Procure the book, and see if we do not tell you the truth. shape. It has been prepared, as the author states, with the co-operation of Prof. Marsh of Yale College, our highest authority on this branch of the subject.

BULWER'S NOVELS.—Some men's fame die with them. With their mortal remains are buried all the memories that pertain to them; the memories of others live ever after them in their thoughts uttered and written. Such will ever be the case, we believe, with Lord Lytton. His name and fame lives still with a new renewal of intellectual life. We are happy to announce, in illustration of this fact, that the well known publishing house of Lippincott & Co. are about to issue an American edition of Bulwer's novels, that shall meet the wants of the times. This new claimant for the good will of the general public and the admirers of this popular series of novels will be delighted with the first book issued. "Kenelm Chillingly" leads the set, of which about twenty-five volumes will make complete, is elegant enough to suit the most fastidious; printed in large, fair, round, open type, it can be read with ease by old as well as young, and this fact alone will much enhance the value and increase the sale of this work.

KEY TO NORTH AMERICAN BIRDS. Containing a concise account of every species of Living and Fossil Bird at present known from the continent north of the United States and Mexican boundary. Illustrated by six steel plates and upward of 250 wood cuts. By Dr. Elliott Coues, U. S. A. Salem: Naturalist's Agency, Boston. Estes & Laureat, New York: Dodd & Mead. Large 8vo. pp. 361.

The various highly commendatory notices of the press which this work has received, have induced us to look closely into it, to ascertain whether it is really worthy of the compliments it has received, and whether it is all we could expect from an author of Dr. Coues' acknowledged position. After mature examination we have no hesitation in endorsing it as a valuable contribution to Ornithology, and one which, moreover, satisfactorily fills a place in the literature of the science hitherto entirely unoccupied.

The author's idea in preparing the volume appears to have been the production of a text book on the subject which, while presenting a complete exposition of the present state of the science, should be adapted expressly to the needs of the beginner and the amateur. Not that the work should not take a position in the standard literature of the science as recognized and used by professional ornithologists, but that it should also put the matter before the uninitiated in a way to make them understand it, even though they have had no previous experience in ornithology whatever. No one can now be deterred from entering upon this pursuit by fear of the sesquipedalian technicalities that hedge it about; for in this work the path is smoothed and made perfectly clear.

The volume is divided into three parts. First we have an Introduction, which is a clear and concise exposition of the leading principles of the science, with a minute description of what the author calls the "topography" of a bird, to which is added, incidentally, as it were, a considerable account of anatomy; the whole representing a definition and explanation of all the terms ordinarily used in descriptive ornithology, familiarity with which is essential to understanding of the subject. A student who masters these few pages can appreciatively and intelligently understand pretty much anything he may find in the whole range of ornithological literature.

The "Key" proper is a continuous artificial analytical table of some half-dozen pages, similar in plan to those which have been found so useful in Botany, by means of which any specimen of North American bird may immediately be referred to its proper species, genus and family. Nothing is required to use this Key with facility and success, but the "little learning" that the Introduction supplies. Although apparently intricate, this Key, entirely original with the author, is as simple as possible, the student being only required to decide for himself in each instance, whether the specimen he has in his hand shows or does not show a given character. By this process of elimination he arrives at length at the name of a genus, which is that to which the specimen belongs, and is readily found in the body of the work.

The main body of the work is what is modestly called merely a Synopsis of North American Birds; but it is really an extended treatise on the subject. A synopsis might have been prepared fully up to the requirements implied in such a name, with only a brief definition of each species. But we have much more than this. Under head of each species a complete and lucid description is given, often including the various plumages depending upon sex, age and season; the scientific and vernacular names are presented; the geographical distribution is given in every instance, as are also references to various standard authors, as Wilson, Nuttall, Audubon and Baird, &c., as well as various late memoirs of importance, scattered through the publications of our scientific societies. Although the plan of the work does not include biographies of the birds, many terse and pointed indications of habits and other peculiarities are inserted. The author seems to have been continually struggling with himself to keep out things that he would gladly have enlarged upon, but which the limits he had set for himself forbade.

The Synopsis has another and very important feature, the absence of which from a "synopsis" might have been deplored, but could not have been charged as a defect to the author. We refer to the excellent characterization of the families and higher groups. Each such group is trenchantly defined, in every case in which the present state of the science admits of such definition, and the definitions are based not only upon American forms, but upon exotic as well. The leading characteristics of the groups are sketched with a bold, free hand, giving the student further insight into the subject, and making him acquainted with the groups at large, as well as with their special American representatives. These characterizations have been pronounced by high European authority to be the best that have appeared, especially in so far as they relate to the difficulties and uncertainties of classification. To the professional ornithologist the synopsis is especially valuable, since in it almost for the first time in a general work, critical discrimination is made between "species" and mere geographical "varieties"—a distinction long needed, yet owing partly to the cramping of ideas by the binomial nomenclature, a reform late in coming.

We should not omit to add that the volume contains an account of the Fossil birds of this country, now for the first time presented in connected

ANNOUNCEMENTS.

THE LIFE OF JOHN WARREN, M. D., Surgeon-General during the War of the Revolution. First Professor of Anatomy and Surgery in Harvard College. By Edward Warren, M. D. Boston: Noyes, Holmes & Co.

KINDERGARTEN CULTURE. By W. N. Hailman. Cincinnati: Wilson, Hinkle & Co.

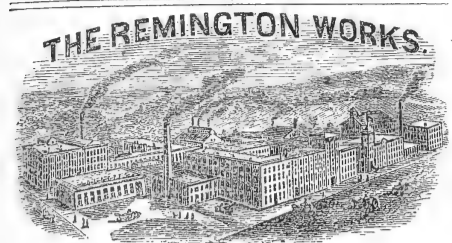

MRS. MAINWARING'S JOURNAL. By Mrs. Emma Marshall. N. Y.: E. P. Dutton & Co.

THE PRIDE OF LEXINGTON. A Tale of the Revolution. By William Seaton. N. Y.: P. O'Shea.

WILLIE BURKE. A Story of an Irish Orphan in America; and THE CROSS AND THE SHAMROCK, an Irish-American Tale of Real Life. Both books of an interesting character. Boston: Patrick Donahue.

CANADIAN STATISTICS.—The following statistics in regard to the population of Canada, taken from the *Canadian Monthly*, are interesting:—In 1861 the population of what is now the Dominion of Canada, exclusive of Prince Edward's Island, was 3,090,561; in 1871 it was found to be 3,485,761, or about an increase of 12.21 per cent., or of about 1.22 per cent. per annum. This shows that emigration has been directed from Canada to the United States. The area of the Dominion of Canada was 215,892,020 acres in 1871, but since that time has been extended. There is ample room in it for 200,000,000 people. In 1871 it was occupied by 622,719 families, living in 572,713 houses. There were 1,764,311 males and 1,721,450 females in 1871, showing an excess of 40,000 females. Of Indians, according to the census of 1871, there were 23,035, showing an increase of 51 per cent. in the last ten years, which is a lesson in which the United States might profit by knowing how it was done. It seems that the augmentation, though really due in some respects to a natural increase, is rather due to a more careful counting of the Indians. Of negroes, in 1861, there were 18,921 persons; in 1871 our African cousins had increased to 21,496. Of the whole white population 31.1 of them are of French origin, 24.2 of Irish, 20.2 of English, 15.8 of Scotch, and 6.6 of German or Dutch origin. In 1872 6,591,339 tons of shipping entered the Dominion, being nearly two tons to each inhabitant.

PEERLESS & PLAIN
FINE CUT CHEWING,
Vanity Fair
Cut Cavendish Smoking.
Ask your Dealer, or send direct to our
works for a supply of PURE Tobacco.

VIENNA, AUSTRIA, Nov. 30, 1873.
Messrs. Wm. S. Kimball & Co.:
Sirs—A friend of mine sent me, with a transport
of Indian Shells, two pounds of "Vanity Fair," which I declare
to be the best Tobacco I ever smoked. We have very good
tobacco in Vienna—Turkish and Hungarian, but "Vanity Fair"
is the King of all, by its aromatic flavor and the right sort of
strength. My friend in New York got an appointment in
California, by that reason I apply immediately to you, begging
you to send me for the enclosed ten dollars, a supply of "Vanity
Fair," and send with the next steamer to Germany. If there
is a German firm that sells your excellent "Vanity Fair," I
beg you to enclose me the address.
Dr. Jos. Hyrtl.

Professor of Anatomy in the University of Vienna.

TO GUNSMITHS.
The celebrated Black and White BRONZING PRO-
CESS, such as is used upon Scott, Greener & Co.

Sportsmen's Goods.

This Rifle, after being tested in the severest man-
ner by the late Board of U. S. Officers, appointed by
the Government to select the best arm for the service;
and after examining over one hundred different sys-
tems, including the best guns of Europe, say of it,
"that it is the best rifle they have seen, or of which
they have any knowledge. They therefore recom-
mend it for trial in the hands of the troops. A seven
pound carbine on this plan, with coarse military sights,
has made better targets at Creedmoor the past sum-
mer, than the best English and American target
Rifles weighing 10 pounds and having peep and globe
sights.We are now making these guns to supply the nu-
merous demands, and will soon have them in the
market.The following is our scale of prices:—
SPECIAL MAGAZINE RIFLE for large game,
carrying from 3 to 8 cartridges, 70 to 85 grs. of
powder, 350 to 400 grs. of lead, 8 to 10 lbs.
weight, according to finish. \$60.00SPECIAL LONG RANGE MAGAZINE RIFLE
for Creedmoor shooting, 90 grs. of powder, 480
grs. of lead, carrying 3 to 8 charges, weight, 10
lbs. from \$100 and upwards.MAGAZINE RIFLES for general use. Carry 3
to 9 cartridges. 60 grs. powder, 350 grs. lead
from \$40.00 and upwards.SINGLE BREECH LOADERS for long range
Creedmoor shooting, 90 grs. powder; lead, 480
grs., from \$60.00 and upwards.SINGLE BREECH LOADERS for general use, 6
to 7 lbs., 60 grs. powder, 350 grs. lead, from \$30.00
and upwards.The calibre of all our rifles, unless otherwise or-
dered, will be .45-100.All communications should be addressed to
BETHEL BURTON,
Care Ward & Co., 54 Wall St., N. Y.

Paper Shell Creaser.

NEW, SIMPLE AND EFFECTIVE. It fastens the
shot wad firmly, lessens recoil, and improves the pat-
tern. Can also be used as a loader, and is easily car-
ried in the pocket.

ENOCH ARDEN.

For Forest and Stream.

HIS LETTER.

So you've "found I'm alive," and you tell me
You've doubled up agin?
Thought the old man had petered?
Which allow me to say is thin.

You say how I never writ you,
As is true enough I allow,
Being busy one way or another;
No matter—I'm writing now.

I hadn't no sort of notion,
When I started fust out here
That I shouldn't a seed you sooner
Than four and twenty year.

But the cards they was stocked agin me,
And the best of luck will fail;
Was down of aguey and typus.
And part of a year in jail.

Which was simple parsecution,
For the corpse wan't robbed or stript!
Then I lost an eye at a party,
But his widder allowed I whipped.

Yes, I hev had a gay experience.
But I allus sighed for hum,
Allus did pine for the fireside,
And the old New England rum.

You kin sort out the cubs of the stranger
And gin a good fair start;
I might be called weak to spare 'em,
If I hadn't a parent's heart.

I'm glad he's made over his plunder,
And done the square thing by you;
I could almost forgive the critter
If his name warn't Number Two.

Tell him I'm coming easy,
Me and a smooth-bore gun:
Tell him to pack his coffin,
And look out for Number One.

J. J. ROCHE.

For Forest and Stream.

Notes From Cape Breton.

SALMON FISHING ON THE MARGAREE.

EACH succeeding number of your most welcome paper reminds me of my unfulfilled promise to give your readers some notes of a trip made last summer to the island of Cape Breton which may be of interest to some who may be already laying out their plans as to how and where they will spend their next summer vacation. Last July I would have eagerly welcomed a plain, unvarnished tale, such as I now propose to give, as a great assistance in enabling me to decide the question, "Shall my vacation be spent at Cape Breton or not?"

I left Toronto in company with two friends on the morning of Monday, July 8, reaching Portland on Tuesday afternoon, a few hours before the departure of the steamer Falmouth for Halifax. We ought to have made Halifax the next night about 11 o'clock, but in consequence of a heavy fog which came on during the afternoon, we had to lay to outside until the morning, and therefore did not get into Halifax before the departure of the morning train for Pictou, and this lack of connection caused us to miss the Thursday's steamer from Pictou to Hawksberry, and threw us over until the next Tuesday. This was a serious disappointment, but we made the best of the situation by taking a carriage next morning from Pictou to the west branch of the St. John river, about eighteen miles distant, where we camped out beside the little rippling brook until the following Monday afternoon. Here we had a most enjoyable time. Our tent was pitched on a knoll about two hundred yards from a farm house, whose occupants furnished us most kindly with daily supplies of bread, delicious butter, milk and porridge, with occasional feasts of wild strawberries, "smothered in cream." In this little retreat we took somewhere about 400 or 500 brook trout with the

fly, surprising the natives there by our success, for until then they had no idea that the fish were in such abundance.

On Monday afternoon we returned to Pictou, and at noon on the following day took the steamer Princess of Wales for Hawksberry on the Gut of Canso, which we reached about 6 o'clock that same afternoon. We had arranged that one of our party should undertake to secure our seats in the stage, but we needed not to have been so anxious as on our arrival we found fifteen or sixteen stages and a host of vociferous drivers soliciting fares. One John McIntosh, a Highland Scotchman, secured our party of three, and two others filling up his old-fashioned coach, which like all the others was built with the body swinging upon leather straps, as experience proves these to be better adapted to mountain travel than any other form.

Away then we started about 7 P. M., the second of a long procession of stages, our route lying over the mountains of the west side of Cape Breton Island for thirteen miles to the west bay of Lake Bras d'Or. John McIntosh was determined to keep his advanced post, and rattled us up hill and down over the narrow bridges and around short curves of the gloomy road which appeared like a long avenue between the green firs, at a pace which kept my hair on end until we at last reached the tavern at West Bay. Here we found there was no accommodation, and therefore made for the little steamer Neptune and took possession of the main cabin, (size, 15x8 feet,) which was soon filled up, table, seats and floor, by the tired travelers, until 5 A. M., when we started to traverse Bras d'Or Lake.

We arrived at Baddeck on the north shore of Bras d'Or Lake about noon. Here we took dinner at the comfortable inn kept by Mr. Cowdis, and soon after started in his stage for the northeast Margaree. Our route lay across the mountains in a northeast direction, crossing over first the Baddeck river, which affords excellent trouting, but up which salmon do not run until September; then over Middle river, where gold has been found in limited quantities; then skirting the western side of a little stream, and of a long, narrow lake called "Lug-a-low," or Lake of Law, (which name, if either, was correct, I could not determine,) which lay between us and the magnificent mountains on the other side of the valley, until by an almost imperceptible ascent we reached the height of land, after traversing which about a mile we descended a steep hill, and found ourselves at our destination in the Margaree settlement, about thirty miles from Baddeck. The evening shades had commenced to close around us, and right glad were we to find shelter from the pouring rain and the drenching mists which had enveloped us during our whole journey, drenching us to the skin, and much impairing the enjoyment of the wondrously beautiful scenery, although the clouds of mist rolling over the mountain tops and down the lovely valleys, invested them with a grandeur and sublimity which fair weather and sunny skies would have failed to produce. The next two days, Thursday and Friday, continued so gloomy and wet that we were unable to perceive the beauty of the valley, and although in our eagerness we several times vainly attempted to entice a salmon out of the swollen and muddy river, we were glad to take refuge from the storm, and beside the cosy fire await the subsidence of the torrent and the return of bright weather.

On Saturday it cleared up, but the river was still too swollen for sport, so that we had ample time to take note of our surroundings. The Margaree settlement occupies a level valley about seven miles long and three broad, which is surrounded by mountains covered with evergreens, scarcely, if at all, marred by the ruthless hand of civilization. To the south this valley is closed in by a rounded "sugar loaf" mountain, separating it from a settlement called "The Big Interval," while to the north it curves eastward, and is bounded by a narrow gorge, through which the river runs to join, about three miles below, with the western Margaree, descending from Lake Ainslee. This valley is dotted over with farm houses, small but comfortable, inhabited by a simple, hospitable people, mainly of Scotch and American descent, whose forefathers settled

here nearly one hundred years ago, and who, shut out until quite recently from all intercourse with the civilized world, have been content with mere existence, and have allowed their fertile plain to run to decay, until now their farms consist merely of broad fields of stunted grass, smothered with daisies and "rattle grass." Here and there may be seen small patches of oats, but besides these not another crop—no orchards, nor gardens, nor roots. Numerous shade trees, principally elms and evergreens, stud the plain, and through these winds the Margaree River, the perfection of a salmon river, inasmuch as it presents a succession of deep pools and shallow rapids, with pebble bottom as clear as crystal, sheltered by trees, but without any impediment anywhere to the casting of a line or to the landing of a fish, and above all, totally free from the *bête noir* of the angler, the black fly or the mosquito.

The importance of this latter recommendation will be appreciated by any salmon fisherman whose enjoyment has been marred or nearly annihilated by the persistent attacks of these ferocious insects. I know of no other river on this continent where a gentleman can find the shelter of a comfortable farm house, within half a mile from a salmon pool, on the banks of which his wife or daughter may repose and join in the intense excitement of hooking and landing a twelve or twenty pounder without any alloy from black fly or mosquito. This is as it might be, but I am sorry to be obliged to add that so little do the inhabitants appreciate the advantages which they might derive from protection of the salmon that they all, with few exceptions, are in the habit of regularly spearing and netting the pools, to the unutterable disgust of sportsmen who have journeyed many hundreds of miles in search of health and recreation, and who would spend in the valley ten fold more than is realized by the unlawful spearing. Four times did these stupid people, with blackened faces, launch their boats miles up the river and spear every pool down to the very end of the valley, even in the pool at which I was located with a gentleman who for three or four years had been accustomed to spend the salmon season there. I tried to impress upon the inhabitants that they were "killing the goose that laid the golden egg," and that if they would stop their unlawful practice, advertise the advantages of the locality and routes of travel, and extend a welcome to sportsmen, every house in the valley might be filled with gentlemen whose expenditures would amply repay them for the value of the fish they so unworthily killed, and whose presence would stimulate them to improvement in every respect.

Some allowance must be made for the poor people, however, for when the patents for their lands were issued fishing rights were secured to them, and as hitherto the large majority of sportsmen have located in tents around the forks of the river, three or four miles below the settlement, spending little or nothing among the settlers, these naturally feel that protection of the salmon in no way interests them, but merely protects the sport of those transient pleasure seekers. I urged upon them, also, to try and obtain from the government, by purchase if necessary, control of the river, so that they might (which I think every sportsman must admit to be reasonable) issue licenses for rod fishing, and so they would have an incentive for the protection of the fish. With these exceptions, I am glad to bear my evidence to the hospitality which I received, while I lament the supineness which has allowed their beautiful valley to run into such deplorable decay. It is to be hoped that the opening up of the Sidney coal fields, and increasing facilities of market with the influx of pleasure and health seekers, will stimulate the Margaree people to make this valley as it ought to be—a little paradise.

It was too late in the season for good fishing when I arrived there; nevertheless, on the Monday after the river subsided, so that the water reached its proper condition, I, a comparative novice with salmon, secured three fish of the respective weights of twelve, fifteen, and twenty pounds. I took afterwards three more, and lost several from unskillful handling, so that I had no reason to complain when many inexperienced fishermen are not even so successful.

If spearing had not been so unremittingly practiced, I am confident I would have taken three times the number, but so disgusted was I that for days I never wetted my line. As to flies suited to the river, I found that at that season small dull flies succeeded best. Of my collection, made by Forest & Sons, Kelso, Scotland, who, I think, make the perfection of salmon flies, the fairy, fiery brown, and dun wing were the most taking, although the last salmon caught on the morning I left for home was allured by a Jock Scott.

I fear I have spun out this prosy letter to a tiresome length, but before concluding I must correct an error which I find in your most readable book "The Fishing Tourist."* Your statement would imply that the west branch of the Margaree, that which descends from Lake Ainslie, is the important fishing ground, and this idea is confirmed by the maps, which represent the northeast branch as an insignificant tributary. The fact is, that the northeast Margaree is the main river, running down nearly the whole extent of the northeast angle of the Island from near Cape North, and is a clear stony stream, while the west Margaree is small and muddy, and comparatively unfrequented by salmon. The best fishing ground is at the forks. When I arrived there were no less than ten tents within a radius of ten miles at the forks, one of whose occupants took no less than sixty-six salmon with his single rod, another thirty-six, and another thirty-three. These sportsmen locate themselves there in the beginning of June, and await the run of the fish, and it is the understood practice that when a pool was settled upon it became the right of the settler, so that I was deterred from setting up my tent then. Before I left, however, the forks were completely deserted, and I tried my hand there on my way back from a trip to the mouth of the river. Within a quarter of an hour I had hooked a fish of fourteen pounds in what is known as Biscoe's pool, and which had been regularly fished most successfully for the whole season. I was unfortunate in breaking the end of my rod as I was fishing with a long line in mid-stream, and, never expecting that a fish would lie near the shore, I drew up too quickly to make a fresh cast, when just then my fish struck and away went my tip. I was bothered, but succeeded in landing my fish, and as it was late I went up to the house to mend my rod.

I expected rare sport the next morning, as the salmon were jumping in all directions in the pool, but could not get a rise. When I went up to the house one of the men remarked that he feared I would not have much sport, as the pool had been speared during the night. On enquiry, it turned out that between fifty and sixty salmon had been speared out of that pool, which was only about two hundred yards long, so I packed up my rod in disgust and drove back forthwith to Eldridge's, where I was lodging, and would not put my rod together until the morning I left for home, when, as I stated before, I took a fifteen pound fish with a Jock Scott. I nearly lost this fine fellow, for being anxious to start, with my mind preoccupied by thoughts of home and dear ones there, I was mechanically casting away in a splendid pool where a small brook joins the main stream, when I was startled by the sudden spring of my rod and the scolding of my friend as the fish made his run. I almost lost him, but recovered my presence of mind in time, and after a short but vigorous fight for life my beauty was gaffed for me by my friend.

Thus ended my season's sport, and within an hour afterwards I was en route for home.

You are quite correct in stating that the Margaree is one of the best stocked salmon rivers in the world. Notwithstanding the immense number taken in nets at the mouth, and used by the canning establishment there, the large numbers taken by rod fishermen during the season, and the almost fabulous numbers that are speared and netted higher up as they are spawning, still they are apparently undiminished, and this year were more abundant than for many years previously.

One word as to cost of transit. From Portland to Halifax and return, \$10; to Pictou and return, \$6; to Hawkeberry and return, \$6; to West Bay and return, \$2; to Baddeck and return, \$2; to Margaree and return, \$6. To these items add staterooms, meals, and incidental expenses, and an estimate can be formed of the cost of travel. Once there the cost of living is very moderate. Yours truly,

J. H. R.

*The "Fishing Tourist" has selected the route via Ainslie Lake as the most practicable and avoiding tedious journeys by stage, and not because the fishing of the West Branch is the best. We prefer to take the Port Hood route.—ED.

MAY SHOOTING AT ATLANTIC CITY, N. J.

EDITOR FOREST AND STREAM:—

There is a period of the year when the sportsman has nothing to occupy him until July when woodcock are sought for, (unless he be a lover of the "gentle art,") and this period is May and June. There is nothing now in season excepting "baybirds," and under this head are included the curlews, godwits, tattlers, and rovers, the only true snipe in the region being the *scelopax noveboracensis*, or quail snipe, grayback and dowitcher, as it is called in different localities.

When the greater portion of these species which visit our coast in the spring have passed north to their breeding grounds, last of all comes the red-breasted sand piper, or robin snipe, as I will call him for familiarity's sake.

After I have "wet my line" in my favorite trout stream to abate the fever which May always brings to me, I prepare for a short shooting trip either to Atlantic City, West

Creek or Long Branch, and about the 20th to the 25th of the month find the robin snipe have arrived and taken up their quarters on the innumerable bars and meadow islands for which the New Jersey coast is noted.

Last May having invited my friend George C—n to join me, I determined to initiate him into the mysteries of robin snipe shooting, when the sun was pouring down his rays to be reflected from the meadow, and making it anything but pleasant for a man of florid complexion. We had engaged Joel Conover as our baymen, by letter, and reaching Atlantic City, stopped at Shauler's hotel, the headquarters for sportsmen, and found two parties of gentlemen bent on the same amusement as ourselves, and from them received very flattering accounts of what we might expect on the morrow.

At early dawn we were awakened and found breakfast awaiting us, and Joel fully prepared. The inlet being but a short distance from the hotel, we were soon under way with a good breeze, and shortly found ourselves at the shooting ground. As the sun rose, we saw countless numbers of robin snipe and bullhead plover, moving from the bars and flats which they had been "using," as the baymen term it, the rising tide driving them to the meadows to feed. Had it been low water, we would have shot from the bars, but as the tide would soon cover them, we collected together a quantity of sea weed and formed an oval blind sufficiently high to hide us when on our backs awaiting the near approach of the birds. Spreading an india rubber blanket in our hiding place on which to lie, our stool birds having been artistically arranged ten or fifteen yards from us, we prepared ourselves for the robin snipe which were passing and repassing, and showing every inclination to "use" the shallow pond near by on the meadow.

We were scarcely settled side by side when seven plover came to us, and all but one were killed, C—n and Joel doing the shooting, as I had not as yet fully prepared myself. Flock after flock of robin snipe were whistled up to our decoys, and great havoc was made each time in their ranks. And here let me describe a whistle I use for calling plover and robin snipe, with which a most perfect imitation can be made. It is nothing more than the school boy's penny whistle of tin, two pieces of round shape, an inch in diameter, soldered together at the edges, leaving a space in the centre, and two small holes punched through the sides at the middle; this is placed in the mouth, and the drawing in of the air and expelling it with some modulation of course, resembles the note of the bird you wish to call, and it can be heard at a great distance.

Before evening we were glad to start for home, and could count our game by scores. The sun, however, punished us fearfully, and my friend presented a sorry appearance indeed, but was not prevented from trying a second day.

All the Conovers, Will, Adam and Joel are good men, but I am inclined to favor Will, as he is a hard worker, and although not so good a whistler as Adam, I would engage him nevertheless, for my tin toy fills the gap, and is generally looked to as the caller. The coming May, should I try the robin snipe I shall wear a light mask of some kind to protect myself from the sun, which on these meadows is powerful, and peculiarly dazzling to the eyes, and I have no doubt something of the kind would answer admirably. In May the mosquitoes have not made their appearance, and the only drawback to the pleasure is the one I have mentioned. In September, when the baybirds have returned from the north with their young, it is the middle of the musquito crop, and we find no enjoyment at that time. So if one wishes to choose his season and is desirous of trying Bay shooting, let him take May by all means.

"Homo."

For Forest and Stream.

CUPID ON SKATES.

A PEEP AT A CANADIAN RINK.

WITH love making in the tropics the majority of readers are doubtless more or less familiar. Vows are whispered in the "balmy, soft-breathing night." There are orange groves, sweet violets and magnolias; a faithful slave or two, and an old time plantation house. But these and other "properties" have figured so often in light literature that they may be classically described as "played out." Ditto with regard to stories of the war. Yet people must write. That iron monster, the "six-cylinder," is insatiable. His attendant minions are ever clamoring for "copy." You have heard no doubt now geese are penned up before a hot fire to increase the size of their livers for the making of *paté de foie gras*? A somewhat similar process is observed in feeding a six cylinder. If you ever have occasion to visit a newspaper office you will notice cooped up in small apartments or chained to desks or tables, a number of unhappy looking men. These are the victims of the insatiate six-cylinder. They are required to furnish a certain amount of brains each day in the form of "copy," with which to feed the monster; and after they become worn out they are thrown upon the mercies of a cold and uncharitable world. Far better be a goose and be killed for your liver.

But I fear I am wandering from my subject, though the ill-natured will readily perceive the analogy between geese and lovers. My intention, however, is to present some sketches of love-making in the frozen north.

Do you know what a rink is? Ten to one you never heard the word before, unless you or your forefathers came from the Land o' Cakes. There is a Scottish game called "curling," which is played upon the ice with smooth stones, and the place where the game takes place is a rink. In

Canada a rink is a large building of brick or wood, enclosing an artificial pond. The water is let in gradually at the beginning of winter, and frozen to the depth of three or four feet. As it is worn away by the skaters, and becomes rough, more water is let on from time to time, and so despite rain-storms or snow-storms good skating may be had until warm weather arrives. There are dressing and refreshment rooms, and galleries and promenades for lookers on, due provision being made for those who have to play the unenviable role of chaperon.

Let us enter. You pull at the bell handle; the outer door is opened by a servant in livery, (this is a rink frequented only by the *creme de la creme*, and its portals are sacredly guarded,) and you stand in a narrow hall. A confused sound reaches your ears. It is as though many hundred scythes were being sharpened on as many grindstones, while other scythes were laying low heavy swaths of rustling grass. The air is damp as at the portal of an ice house. As an inner door is opened the noise increases, and becomes more confused; a strong breeze, created by the skaters as they sweep rapidly round and round, reminds you of your rheumatic tendencies; while all that you discern is a number of dusky, half indistinct figures moving to and fro with marvellous swiftness. In a second or two you regain your wonted composure and see things more clearly. You stand upon a platform extending from one side of the rink to the other, and from which open dressing and refreshment rooms. Next to the ice are wooden benches for the chaperones, who—bless their dear old frozen souls—sit patiently for hours to protect their darlings from young men who are not "eligible," the word signifying money, and not applying in the remotest degree to brain, morals or good looks. But as we shall see hereafter, the chaperone's power ends where the ice begins, and the "flirtation boxes" are beyond her reach. These "flirtation boxes" are simply the niches between the timbers supporting the roof, in which seats have been placed. They are only accessible from the ice, and are therefore nice places for an undisturbed conversation. As many of the timbers are of very considerable thickness, those occupying the seats are quite excluded from the gaze of the chaperones on the platform. Opposite the entrance, at the far end of the rink, is a platform for the band, occupied two or three times a week, when quadrilles and lancers are danced upon skates, even more gracefully than in a ball room. The costumes of the ladies vary of course, and a general description of their toilets must suffice. On the head is worn a small, round fur cap; the skating jacket or sack is often of blue or scarlet cloth, with brass buttons, and variously trimmed; a grey or brown tweed dress is looped over a gay-colored balmoral, beneath which are Knickerbockers, or Turkish trousers, which, when the wearer has clumsy ankles, come quite down to the stout laced boots (and when the reverse is the case, are often dispensed with)—add a large muff and fur mittens, and you have the costume of the fair skater. Such is the dress of the young lady who now appears at the door of the dressing-room, with her skates already buckled, and prepares to walk across the platform to the ice. She has a sweet face, and is altogether one of the most attractive ladies you have ever seen. At least, so thinks that lithe, slender youth, with the regular features, black curly hair, and magnificent eyes, who is twirling about listlessly at the far end of the rink. No sooner does he see the well-known figure at the dressing-room door than he gathers himself together as does a horse preparatory to making a leap, and bounds forward as an arrow speeds from the bow. In a trice he is at the young lady's feet, and busy over her skate-straps. They always do need tightening when Will Sweet appears, no matter how tight they may have been drawn before. Rose now gives the tip of her mitten to Will, (not, however, giving him the "mitten" in an unpleasant sense,) a few steps further and she is on the ice. The band strikes up a lively air, and away the couple glide, hand in hand, now fast now slow, keeping excellent time with the music, and dexterously avoiding collisions with less experienced skaters, though to do this it is sometimes necessary to loose hands for a moment.

Look! Now they are doing the "outside edge" inclining at an angle of forty-five degrees, first on one skate iron, then on the other, the opposite foot being held in advance of and over the one which rests upon the ice. Both figures move as one, and their rapid onward motion is not checked in the least. Not so graceful is the "Dutch roll," which is neither bread, cake or sausage, but a performance on skates which baffles my powers of description. The same may be said of many other feats on skates, (no pun is intended,) in which fair skaters contest the palm with the ruder sex.

As the music ceases Will lands his partner among the chaperones. She will not be persuaded into the flirtation boxes, and her chaperon on this occasion is decidedly vinegarish and lynx-eyed. Besides there is Lieut. Fitz Poodles (who is "eligible," having £500 a year besides his pay,) waiting to secure her for a partner. He is rather unsteady on his pins, not being by any means an accomplished skater, and in attempting to salute Miss Budd he precipitates himself head first into the lap of an old lady. He stammers out a "beg pawdon," as he recovers himself, and extends his hand to Rose with an "Aw, pleasure of skating with you, Mith Budd?" The young lady in question does not notice the extended hand, but demurely pleads fatigue. Fitz Poodles thinks he will wait until she is rested, which he is pretty sure will be when the band strikes up again. Will is as usual at the other end of the rink. The leader of the band raises his baton, but before it can fall Will is beside

Rose and claims her hand just as the first notes of the music fall upon the ear. Before Fitz Poodles recovers from his astonishment, his wished for partner is gliding round and round the rink with his hated rival. He grinds his teeth savagely beneath his blonde mustache, and the blood mantles under his fair skin to the roots of his yellow hair. But he has no resource, so he breathes a wish that Will may come to grief in some of his skillful evolutions, for he is jealous also of his rival's proficiency as a skater. The fates are kind to Will, however, as they always are to the brave and skillful, and no such calamity occurs.

Fitz Poodles is intensely disgusted. He unbuckles his skates, and having refreshed himself with a glass of brandy and water, lights his short clay pipe, and sets out for his barracks, leaving the field to his rival, as well he may.

Shortly after, the odious chaperon, blue with cold, wraps her furs about her and steps into her sleigh to be driven home. Rose promises to leave immediately, but declines a seat in the sleigh. As she emerges from the dressing room with her skates on her arm she bestows a side glance on Will, who, apparently all unconscious, is doing the figure eight in the centre of the rink. But he is far from being unconscious, and counts the seconds after the door closes behind her until he thinks a sufficient time has elapsed to prevent the gossips connecting his departure with that of the young lady. He darts down the rink at lightning speed, not slackening his speed in the least as he nears the platform, but clearing it at a bound lands at the door of the dressing room. In a twinkling his skates are unstrapped, and he is out at the door. A well known figure is just disappearing around a corner. He walks rapidly on with a nervous, eager tread, the crisp snow crushing beneath his feet in the frosty atmosphere. He draws nearer and nearer, but the one of whom he is in pursuit never turns her head, though she well knows whose are the footsteps behind her. Soon he comes up with her, and receives a shy greeting. He takes the skates from her arm, and so they walk homeward together, saying little perhaps, but thinking much.

But the Cupid of high latitude does not confine himself solely to rinks during the season of ice and snow. He also spreads his wings and shoots his arrows, on bright, sunshiny winter days, on the glossy surface of crystal lakes, lying in meadows or embedded among fir-clad hills. Such a lake I see before me now. It is some three miles in length, by one in breadth. Save at one cleared spot the dark fir trees come down the hillsides to the very edge of the ice. It is a clear, bright, bracing winter's day, and the ice is hard and smooth as glass, reflecting, as in a mirror, the surrounding woods and the skaters gliding over it.

Rose is well provided with chaperones to day. She is accompanied by her two brothers, an uncle and a cousin, the latter a wordly-wise young lady, with a horror of flirtations, to which, owing to her plain features and not over agreeable manners, she is never a party. She has a holy horror of admirers who are not eligible, and Will is as poor as a church mouse. He was just behind the party on the road to the lake, but made a short cut through the woods and was on the ice before them. With such a body-guard around his ladylove his chances look poorly enough, but he does not despair. "Brave heart," you know. The old gentleman does not skate, but stands upon the bank and draws such comfort as he may from his cigar. He at least is out of the way. But the cousin and the two brothers do skate, and move off together. Will is never far away, and does not lose sight of them for a moment. Finally the party encounters one of Fitz Poodles' brother officers, whom rumor reports to be looking for a rich wife. He has been deucedly unlucky in horseflesh of late, and the "aged" has refused to pony up anything beyond his usual allowance. Miss Palaver has money and is not insensible to the blandishments of the "tall military gent," as the small boys describe Captain Nocash, and she accepts his proffered escort, leaving Rose to her brothers and—her fate.

Rose turns towards the head of the lake and skates quickly on, with her brothers on either side, and but a few rods away. Soon the ring of skate-irons is heard behind them, and ere many minutes elapse Will is beside the girl he loves. They skate steadily on without exchanging a word, leaving all the other skaters behind them. Finally one of the brothers halts and motions to the other. He hesitates a moment, then wheels to the right about. Considerate brothers!

The lovers are now left to the enjoyment of their own society. Will extends his hand and Rose rests in it the tips of her gloved fingers. They shoot on until the head of the lake is reached. No one is near, and we are fain to believe that Will seized the opportunity for "breaking the ice." At all events the faces of both were unusually rosy as they rejoined the other skaters near the landing: and Will caring nothing for the cold looks of the party he had invaded, accompanied Rose to her own door.

They are not married yet, but they will be some day I am sure, for they are as true as steel to each other, and cold as ice to the rest of the world.

CHARLES A. PILSBURY.

"—Nothing is more sad than a landscape without birds. The well known forest of Fontainebleau, so varied in its aspect, so majestic in its wooded glades, is always melancholy; not the song of a single bird breaks the silence. Destitute of water, for the sandy soil drinks up all the rain, having no spring nor stream, it is deadly for the bird, which flies away as from a land under a curse. Under the first impression you admire it, but by degrees the feeling of sadness oppresses you, and at last renders you insensible to its beauties."

COAXING A DRUMFISH.

A CRUISE OFF THE AFRICAN COAST.

A CRUISE on the west coast of Africa in the olden time, when the "ebony trade" was brisk, was almost without incident to relieve its dull monotony, and, looked back to in after days, the three long years seem almost a blank. Cruising, we but stood up and down, backward and forward, under easy sail or low steam, and while from aloft the lookout scanned the horizon, and wearied his eyes in watching the strip of white that to the eastward marked the sandy beach of a desert coast, to us on deck invisible, we killed our time as best we might with pipes and books, with chess and chat, taught our docile parrots new tricks and phrases, or lazily dozed away the hours—the weary hours of mid-day calm.

Exercise seemed impossible. The great red sun drove his ardent rays through and through our well worn awnings, the white decks steamed, the paint work blistered, and the black lines of pitch lost their tape-like symmetry and oozed meltingly into little tacky puddles, the brass rails glowed with the fervent heat, and even the great shark, lying perchance deep under our counter, seemed to pant and gasp, and turned loathingly from the chunk of pork, which in seeming innocence dangled listlessly by his very nose.

Rolling gently to an fro on the ever breathing sea, sails flapping, ropes rattling, yards creaking, ladders squeaking, we exist and wait for air. Presently a little puff from the northwest, again another, then a gentle breeze; the tired mercury sinks in its tube and life again comes to us, for the sea breeze has made. Now we look for a prize. There is a river breaks the contour of that strip of sand to the eastward—the noble Congo—and somewhere up in its mysterious fastnesses are trim vessels, laden with human flesh and blood for freight, watching the chance to slip out. This late strong sea breeze is what they need, and taking the chances of the distant cruiser's failing to discover her in time, out one slips. Pressing along with the northwest wind, keeping from going to the northward—the speck to leeward, which her captain's trained eye sees at once is an enemy, keeps him from running off—and so, with all canvass spread, he hugs the wind and trusts to his heels.

Sail ho! from aloft, and we crowd on all sail in pursuit. No sleepiness now. We must bring her within gun shot ere she crosses our bow, or we lose her. Rapidly we near each other on converging lines, but night, too, is approaching fast, and in that latitude there is little twilight. It was in her captain's calculations, and for this moonless night, so near at hand, he has patiently awaited.

Onward comes the slaver, seemingly rushing to certain destruction; but the breeze grows fainter, our heavy canvass flaps to the mast, while the swift-heeled clipper, with her light cotton topsails swelling against the buntlines, plump and full like a Breton "swell front" house, darts out from our very grasp, and driving off with the trade wind disappears in the darkness, a fading pyramid of spectral white, and until she reaches the shores of Cuba with her starving, sick, tortured, and festering mass of humanity, she is safe; and then, with an honored flag at her peak, she claims the immunity which that flag, rightfully carried, should always give.

Such was our general fortune. At long intervals better luck awaited us, and a captured cargo involved upon us a trip to Monrovia, where we were welcome visitors to the lazy darkies, who, in white jackets and indolence, are civilizing Africa by teaching the natives how not to do it. Distributed among them as field hands, and taught to raise manioc and prepare cassava enough for their own needs and their master's, our poor Africans are not perceptibly better off than in slavery.

But I am wandering from my intentions, and will endeavor to make amends by changing the topic to one more in consonance with the columns of FOREST AND STREAM. I propose to tell you of the capture of a "drum fish," and to show you how we worked it so that the fate of the other "drum fisherman," poetically recorded in one of your late numbers, did not befall me.

We were lying in the harbor of Benguela, a little white-washed, dirty Portuguese city in the sand, to the southward of St. Paul de Loando. It was a hot and sultry night, following a hotter day, during which we had drifted into port. Stretched about the decks, in light and airy costumes, and in uneasy postures, we rolled and shifted to the full extent of our Loando mats in vain search of a softer plank or cooler spot. Save for the occasional sound of a well beaten "tom tom," or the higher screech of some native songster, perhaps serenading some dusky innamorata, or more likely working off the effects of New England rum, all was silent both on shore and sea, when suddenly, from the depths beneath us, an unearthly groan startled us from repose. Beginning low, it gradually rose in volume and cadence till the whole ship seemed to vibrate; then it died away, and we speculated. Again it boomed upon our ears, and with a ventriloquial effect, for the sailor on the fore-castle and officer on the poop were each equally sure that the sound was just beneath him. And so through the long night we were entertained with this subaqueous concert, than which a forty horse power steam frog could not have done better. The breakfast hour brought its usual assemblage of wisdom, and many were the oracular opinions and Bunsbrian explanations of the night's phenomena.

For Forest and Stream.

Bumboat Tom was brought into our councils, and elucidated the mystery. "Oh, sar, dat was larshe feesh, sar; he very larshe, very bono for eat him, sar; malo for catch him; we call him drum fish, sar."

Tom said that they were plentiful, that they fed only at night, and that the proper bait for them was sardines. I made up my mind that on another night I should make closer acquaintance with this musical genius, and to that end cultivated the armorer and captain of the fore top. The former forged me a fine, large hook, well tempered, and big enough for a halibut, and the latter, with a little wrench he had, laid me up a long strong line from a dozen of the best that I could procure—wire laid in for a fathom from the hook, guarded against sharp teeth. At supper time Tom brought me a pail of live "sardines." He called them so, but they were a foot long, and more like chubs.

Night came, and I could hardly wait for the sound that was to signalize the approaching fray. Presently it began, and slipping over the port gangway I took possession of the dinghy which lay moored at the booms, and in company with Johnny Shea, a tight little foretop boy, who was always my right hand in my shooting and fishing trips, I prepared for action. Seeing everything clear, I lowered away over the boat's quarter, and way down below the dancing sparks that the ripples produced in the phosphorescent sea my line became a beam of light, flashing as carried to and fro by the struggles of my lively bait. I had not long to wait.

Suddenly a mass of light appeared from under the ship, turned into fire as it surrounded and encompassed my hook, and then came a pull, not a tug or jerk, but as though my hook had caught firmly in the coral reefs, the bottom slowly settling away from me. Quickly I hove out a bight of the line, that he might gorge the bait, then trembling with anxiety I struck.

"Have you got him, sir?" screamed Johnny.

Got him! I might as well have got a locomotive. Johnny's cry brought a row of heads above the hammock rail, and the officer of the deck forgot dignity and gave me an encouraging word; but I hardly heeded them. Twenty fathoms of that line flew through my cut and bleeding fingers before I realized that I was in for it. Then, the first mad rush over, he pointed seaward, and struck out more slowly but irresistibly, and fathom after fathom he took my line; half gone—two thirds—and no let up. I hove a turn around the shank of the brass row lock, and while I eased away as slowly as possible Johnny bent the end of his line to mine, and I had another hundred feet. I didn't play that fish—it was all business, and he had the managing of it. Would he never stop? At last! I risked checking him, and, heaving a second turn around the row lock, held on. As I did so the pull nearly at right angles started the boat, and slowly her stern slewed into the direction of the strain. This suggested a plan, and quickly as possible I jumped forward. Johnny cast off the painter, and assisting with an oar pointed the boat, and then, with the boy at the helm, and I with a turn around the stem head, easing off as required, we started on a grand old ride, and surely old Neptune, with his dolphin team, was no better off. His steeds were tame; ours was not. But weight tells, and our heavy boat soon tired him; the line slackened, and then a swishing curve showed that he had taken a new departure, and for a time, freed from our weight, with increased speed he dashed across our bows. But a stroke of the oar, as the line tautened, brought him in line ahead again, and he had another straight forward pull before him. He did not seem to fancy this, but turned and came slowly toward the boat, as though willing to risk the future to avoid the present pain. I rounded in my line, and still he came till alongside, but too deep for us to strike him, and at the upward pull he again shot off, and so for a good half hour more we worked. Once we had him alongside, and Johnny struck him with the gaff, but, as might have been expected, this only startled him, and with spasmodic vigor he made one more grand struggle for life. But it was not to be. The great hook was buried deep in his vitals, and his strength was going fast. Finally the end came, and he lay exhausted and quiet by our side, while we each slid our gaffs beneath him; then a quick upward stroke together and the trouble began again. Only for a moment, though, for with gaffs and line, and, when we could reach, our hands and arms and legs, we somehow twisted him into the boat, which, by our united weights, was careened nearly to the water's edge. And then, used up, we sat and gazed at our conquest, for the silvery sheen of his side, and the phosphorescent drops which clung to his scales, marked even in the darkness his grand proportions, and we were two proud and happy boys. Our united weights would perhaps reach two hundred pounds, and there, gasping and groaning on the thwarts, lay a magnificent fish greater than we two together. Six feet five inches from tip to tip, and broad in fair proportion, a shapely gamey fish of at least three hundred pounds, gave fair promise, which he well fulfilled, of glorious chowders, broils, and fries; and two hundred men can testify to the delicious quality of his flesh.

As we rowed back to the ship—for, whether towed or drifted I cannot say—we found ourselves a good half mile away, I certainly felt more pride in my achievement than any event had ever before caused me. Once since, though, when I brought a noble three pound brook trout to my basket, I have felt the same sensation, and for this last pleasure I am indebted to

PISCO.

For Forest and Stream.

AN OPEN SECRET.

(FROM THE GERMAN.)
E. C. G.

SHE stood among the roses red,
As I came through the waving field:
"A happy day!" was all I said;
She looked to earth, her face to shield,
In silence safest welcome lies,
For wood has ears and field has eyes!

She plucked a rosebud from off the tree,
The sweetest in the sunny land,
And as she blushing gave it me,
I kissed it from her lovely hand.
The rose I kissed, no harm there lies,
For wood has ears and field has eyes.

Alas, that I have grown so white!
My cheek all pale does love reveal!
Who sees me now will guess at sight
What all my secret heart does feel,
And where my love and longing lies,
For wood has ears and field has eyes.

For Forest and Stream.

OTHER DAYS.

BY MRS. EUNICE B. LAMBERTON.

COME sing to me of the sad sea waves
That sigh on a pebbly shore,
That foam and surge with a solemn wall
For days that will come no more.

Bring to mine ear as the night shades fall
Echoes from caverns so deep,
Under the sea, the beautiful sea,
Green dells where the mermaids sleep.

Twine me a wreath of the coral rare,
Branching like spray 'mid the wave,
Pure as crystals that gleam on the shores,
Shores that the wide waters lave.

Tell of the ships that go sailing on,
With canvass spread to the breeze,
The lonely wife and the sailor's bairns,
Ah! whisper me not of these.

For winds will howl and the breakers roar,
And sea gulls scream in adrift;
God pities them when the fire burns low,
And the storm fiend walks the night.

Linger in dreams sweet airs of my youth,
Fragrant of spices that are fled,
Wafting sweet incense over the graves,
Low graves of the early dead.

Vision return of a sandy cliff.
A light-house towering high,
Of tangled moss and the tiny shells,
And boats that are stranded nigh.

Come chant again to the weary soul
Nature's melodious lays,
A silvery sound, an ocean's breath,
Sweet anthem of other days.

ROCHESTER, N. Y., January 21, 1874.

OUR WINTER BIRDS.

IT is generally taken for granted that we have none of our feathered friends left us when the wild winds of winter have sent the last of our songsters hurrying from our presence in town and city. The majority of city folk, ay, and of the country too, seem to think that our forests and fields are annually depopulated with the falling of leaves and the appearance of snow. That such is not the case only those who have studied the habits of birds in open air can testify. Our woods and fields are alive with a vast host, busily searching trees and shrubs, weeds and grass, for insects and seeds. Along our coast, however, are birds the most abundant, principally visitors from the north, to whom our winter winds are as balmy zephyrs, and our storms and ice but small inconvenience. From that vast "liquid magazine of nature," the Atlantic, they draw their food, and upon its surface assemble in noisy flocks.

March is a good month in which to take a review of the winter, that is, for us who are interested in birds, as in that month most of our winter birds depart for the north, and the first harbingers of spring put in appearance from the south. Of the three hundred species known to have been found in New England, about one hundred remain through the winter, some of them residing here throughout the year, but the majority coming from the north in autumn, departing in the spring. That the readers of the FOREST AND STREAM may have a general acquaintance with them, I purpose to mention briefly the species, speaking chiefly from my own observation.

The robin is the best known of our early arrivals; the last of February brings a few from the south, but March sends a hundred for every one of February, and the air is vocal with their music by the last of that month. Though generally supposed to pass the winter in warmer climes, it can be found nearly every month in the year by a close observer. The last week of January I saw a flock of thirty-five flying high in the air. They frequent the woods in cold weather, subsisting upon such berries and grubs as they can find.

The blue bird, in his cerulean coat, and with his pleasing warble, is a welcome arrival about the same time as the robin. If there is any one bird that brings a blessing with it, 'tis the blue bird.

There is a little fellow who stays with us the year round, and who does a vast amount of good in his silent, unobtrusive way. I mean the chickadee, black cap. Titmouse is his proper name, but his well known name of chickadee is more simple and appropriate, as it is so called from his cheerful song. Almost any day in winter you may see him

gleaming among your apple trees, now hanging head down, now flying by the window with a glad chirp and a glance of his bright black eye. He is a merry fellow, this little downy chickadee, and winter would be dreary enough without him.

Another member of his family is here, the creeper, but not very often seen, though he and the nuthatches are busily at work upon the bark of the trees, dodging around them in their queer way, not letting a single obtainable grub escape.

If the month be very mild the white-bellied swallow sometimes, though erroneously called martin, will gladden us with his presence. He is the one with whom the blue birds have such comical squabbles over the possession of the martin houses.

It is rarely that the cedar bird leaves with us a single representative during winter, but he has been known to do so. Of course you know the bird, with its cinnamon-colored coat and yellow tipped tail, its wings with tips of red, like sealing wax.

Perhaps, if everything be favorable, his cousin, the wax-wing, may be seen, but it is hardly possible, as he is a rare bird and prefers the air of Greenland and Hudson's Bay to ours.

If you are an observer of birds, you may have noticed one about the size of the robin, though with a longer tail, of a gray color, and having a sharp, hooked bill, following the flocks of small birds and preying upon them. It is the shrike, or "butcher bird," sometimes called the "nine-killer," from an idea that he always kills just nine birds, beetles, etc., before eating any. Whether he does kill that exact number or not, I would not like to say; but he has one peculiarity that renders him especially noticeable; after killing anything he hangs it up to dry upon a thorn or whatever is convenient, leaving it until he feels like eating it. I know of one kept in a cage who retained this habit, always hanging up the raw meat given him on some part of the cage.

The pine grosbeak is sometimes found in spruce and fir thickets, some winters being of quite common occurrence, and others not arriving from the ice fields of the north at all. It subsists upon the seeds of the pine and other cones, and has a thick strong beak for the purpose of tearing them apart. The crossbills, however, beat the grosbeak in the manner of beaks, their mandibles crossing one another, and having a peculiar twist that enables them to extract the seeds in an admirable manner. There are two species of the latter, the red and the white winged, and they both stay when they come all winter. The red crossbill has been known to breed in Maine as early as February.

Some of the goldfinches remain with us, and the fields are often visited by great flocks of red poll linnets, who do a great deal of good, eating the seeds of the many noxious weeds.

Along the shore and in old fields are immense flocks of snow buntings, their plumage of blended white, black and gray, admirably suited to their haunts, the brown weed-stalks and the gravel of the beach.

That very rare bird, the Lapland longspur, is sometimes found in these flocks.

The shorelarks, or skylarks may be found upon the islands in our bays and upon the shores of our mainland. If I only had space here, I would like to give you Audubon's description of its nest, built in barren Labrador, but this article is not intended for description but enumeration of species. With the pen of even that great naturalist, Audubon, I could not give a sufficiently accurate description; the best way to obtain a good idea of any bird is to see it alive, or well preserved. The museum at Central Park is easily accessible, where will be found most of our birds with their names attached.

The little blue snow bird is a winter resident, and comes to us in October. Rare instances are known of their breeding south of Maine. I found a young bird unfledged on the Hoosac mountain, Mass., in July, 1873.

There are four species of sparrow here in winter, the song, tree, swamp and fox sparrow. The one we see oftenest is the song sparrow. Who can forget its melodious song when the fields are dead and bare?

Of course everybody knows that audacious corn thief the red wing blackbird; he has a bad name in some localities, but in New England he can't muster in sufficient force to do the damage he does in some places. Look for him the first of March, it is his time of arrival.

The purple grackle, or crow blackbird, and his near cousin, the rusty grackle, arrive somewhere from the first to the twentieth of March. The latter is rarely seen, but the former is well known, making his presence felt by his harsh notes and sailing through the air in large flocks.

Of all noisy birds, the blue jay is the noisiest at certain seasons. He lives with us the whole year, and we may suppose he has sore need—when the fields are covered with snow—of the boards of nuts, acorns and corn which he secretes during the autumn months. He and his hated neighbor the crow, are equally hated by the farmer, though, I think, without cause. Weighed in the balance, the good and evil they perform, I am confident the latter would kick the beam. The crows that winter here are probably from the north, our summer crow moving south as winter comes on, giving room to these. It's a hard living they get, when even the traditional "old horse" is frozen solid.

The last of March we hear the pewee or phebe, "phebe! phebe!" The wintry winds seem to lose some of their rigorous cold when these sweet simple notes are borne to

our ears. It is among the first of our birds to set up house-keeping in spring.

The rattle of the kingfisher is heard along our shore the last of the month.

There are two species of woodpeckers resident here, called the downy and hairy woodpeckers from the texture of their feathers. They are both black and white, the males with a scarlet crescent adorning the backs of their heads. The downy is the smaller species, being the smallest woodpecker we have. The three-toed woodpeckers sometimes occur, though rarely. The golden wing woodpecker is the most common as well as the handsomest of the family; he is best known by his local names, such as, "flicker," "yellow hammer," etc. Though a very few may winter here, March is as early as any are generally seen.

Of the eight or nine species of owls found in New England, probably the most common are the mottled and great horned*. The former is the "screech owl," so dreaded by the children who have heard it cry. The latter visits the farm and barn yards during the night, and takes as lawful prey such hens and chickens as he may find. The Acadian, or "saw-whet owl," is the smallest species we have, and in some localities the most plentiful. His cry resembles the filing of a saw. Along the coast, among the sand hills, may be found the snowy or arctic owl, the largest of the family and a rare prize.

If you live long enough and search diligently you may possibly find the golden eagle, for he sometimes comes down from his mountain fastnesses during winter. The white headed eagle, however, is not so rare and may be frequently seen on the coast during winter. He is a mean bird, with not half the noble qualities of the fish-hawk he so often robs. Now that his purveyor, the fish-hawk, is absent, he lives on dead fish and carrion; he may be easily induced to show himself for a dead horse left on the beach or in the pastures.

There are six species of hawks, any one of which is worth looking for. The most common are the red-tailed and red-shouldered, generally known as "hen hawks," from the havoc they commit in the poultry yards. They sometimes lay their eggs by the last of this month. Though rarely seen, the smallest of the family, the sparrow, and the next in size, the pigeon hawks, are residents in winter. The gos-hawk is abundant in some places, while the noble jer-falcon is so rare as to be considered an accidental visitor.

Who has not heard the whirr and drumming of the grouse in autumn? The ruffed grouse is the only representative left us, excepting a few, very few, of the pinnated grouse or "prairie chickens." It is a resident here all the year, and subsists in winter upon berries and leaves.

The little quail is becoming more plentiful every year, and if protected will soon be as abundant as twenty years ago, before the great snow storm buried so many of them.

Towards the last of March the wild geese are seen steering northward; high over head, in wedge-like columns, they cleave the air, speeding towards their summer homes in far off Labrador or Greenland. They have been known to breed in Massachusetts.

"Black duck," sprig-tail," "old wife," "golden eye," "dipper," "harlequin," and half a dozen others of the duck family, including the famous eider, pass the winter in our waters.

The "gannet" and cormorant are sometimes seen off the capes.

Of the plovers but one species, the "rock plover," or purple sandpiper, remains.

Six species of gulls, the vulture of the ocean, may be found, picturesque elements in a winter scene, upon our marshes, and about our rocky headlands.

"Mother Carey's chickens," or petrel, two species, play about our coast all winter.

The great northern diver, or loon, is an inhabitant of our waters throughout the year, but his startling, quavering cry is not heard at this season.

Two kinds of grebes, or "devil divers," exercise their arts to the discomfiture of gunners. They join the throng that hies to the north at the opening of spring. I wish I could include in the list that prince of divers, the great auk, but as he is supposed to be extinct, 'twill be best to omit him. He used to frequent our waters though. The puffins, guillemots and murre, and divers other divers, are well versed in the art of navigation, and visit our shores annually, when the ice fields north of Scotia get uncomfortably thick.

Our list closes with the last and least of the divers, the sea dove, or little auk, who is sometimes blown out of his latitude, and left to the mercy of the inhabitants of the coast.

This catalogue is necessarily meagre, covering as it does so much ground; but after this introduction, I hope to be able to present a fuller and more interesting account of the arrival and departure and time of nesting of our birds.

F. B.

*This owl lays his eggs in Massachusetts as early as February.

—St. Augustine, Florida, has on exhibition a remarkable fragment of stone, taken from the ruins of an ancient structure on Observation Island, in Lake Okeechobee. It is of immense weight and solidity, and, what is most remarkable, unlike any rock on this continent. It resembles granite more nearly than any other, and is of a remarkably beautiful appearance in its structure. It looks like granite granulated with innumerable particles of a glittering substance resembling gold. This fragment may develop something startling in the history of that part of the continent. The Indians have reported frequently that there were ruins of an ancient building on one of the islands of that lake, and this confirms it.

DRIVING A BUCK.

BY THE DOMINIE.

"DRIVING deer" is a very common expression in the Adirondacks, used by almost every body you meet, by some "knowingly," and by others for the sake of appearing "to be knowing. Many readers of FOREST AND STREAM, however, I suppose, do not know, and therefore will not resent it if I say, by way of explanation, that "driving deer" is usually understood to mean putting hounds on their track, and forcing them sooner or later to take to the water, in which they are sometimes killed and sometimes not. There are people who pretend to disclaim against this practice as being very "cruel," "unsportsman-like," &c.—for example: the Rev. Mr. Murray, who, however, does not hesitate in July to allow himself to be paddled up amid the thick darkness of night to deer feeding along the shore, and under the strong light of a "jack," take deadly aim, and kill and talk about it as quite a great achievement.

It is, however, in a particular and not general way that I am writing about "driving a buck," and a sight well worth seeing it was. On a certain morning, in September last, an early breakfast having been dispatched, we started down to the landing place to take our boats and row to the watch-grounds that had been agreed on the night before. There were four of us—the "Executive," "Jeemes," "Louis," and the writer. The Doctor, who had been with us, had fled that very morning at earliest dawn to Canada—forced away by superabundance of "tin." Quite an unusual experience—the scarcity of the article generally being the difficulty in extended tours. But he went, chanting, I have no doubt, according to Tennyson,

"Tin to the right of me,
Tin to the left of me."

I could tell you a good many stories about the Doctor—how he got caught in a gale on "Big Tupper," and in a dense fog on Saranac—but he fled on! on! never stopping until Montreal was reached; and there, at a hotel, in the middle of the night a committee waited on him, and waked him, worn out as he was, to ask permission to examine into his general health, that the cause of such unusual "bass" might be known and remedies applied. The Doctor looked at them in disgust, murmured tin, turned over and went to snoring again. I could tell other stories, but I forbear, for I must be after the buck we started for. The scene is on "Little Tupper"—the mists are driving away toward the east, before the first breathings of a northwester, that proved to us before night got around what a rumpus it would kick up! and what an angry fret "Little Tupper" could work itself into! The morning was not a poetic one, so I cannot stop to sigh and sparkle over it. On the contrary, it was intensely practical—chill and rough; it was a true harbinger of the cold, snowy, rainy, haily winter day that followed. "Jeemes" is to go to Stoney Pond, so he and "Ted" are first off. As their boat gets from under the lee of Sand Point, she pitches and jumps about in a way most lively and suggestive of a soaking; but "Jeemes" is a philosopher, and merely smokes the harder, while "Ted" pulls the harder, and away they dance like a cork across the lake. Louis and his solemn storytelling guide start for the foot of the lake. The "Executive's" man had crossed the lake to put out the dogs, so I invited the "Executive" to go with me on my watch ground, which was to be "Sand Island," or, as I shall always prefer to call it, "Cranberry Island," for here, when tired of watching, I relieved the tedium by crawling about, and picking cranberries, an abundance of which grew on the island. Cranberry Island lies well out in the lake, but is only a small heap of rock and sand, with a few scrubby bushes, and a single tree growing upon it. After a thorough shaking up on the lake our heavily laden boat got safely to the island, where after due preparation we proceeded to watch. It was perhaps 8 o'clock, a. m., when we began this interesting vigil. Will. Moodie "went up a tree," and looked blue at the angry lake, but the lake did not seem to mind it. The "Executive" and I dug holes in the sand and spreading our rubber blankets watched with all our eyes, and with all the extra one we could muster. "Sparrowgrass" says that a "man is a good thing to have in the house." Well, the "Executive" is a good man to have with you on a watch. He never sleeps, has plenty of stories to tell and is generally lively. So he talked, and I, as became one of my profession, smoked, listened and meditated gravely—now and then crawling after cranberries. "Will." had said to me, as we landed, that as the lake was so very rough, if a deer came in at any considerable distance from the island, he would not be able to go after him with either of us in the boat; but he would go alone and try to drive it past the island, within shooting distance, if possible. The boat was pulled up on the sand, emptied of every thing except a rifle and the oars. And then we watched. What an endless number of names I traced on the sand that day! What canals I dug! What elaborate geometric and mathematical figures I marked out, and which the mimic waves washed out! What lines of poetry I composed! all now lost to posterity, for which I have no doubt posterity will be forever grateful. The "Executive" was, I think, in the midst of a discussion concerning the proper method of regularly opening a certain street at home, called fourth, in which, for various personal reasons, he was very much interested, when all at once he stopped. "I see a deer swimming," said he—(this was about 2 o'clock, p. m.)—I jumped, as one can, under such circumstances, and looked, but thought the "Executive" had seen a loon. We were discussing this difference of opinion, and looking first with nature's eyes, and then with

glasses, when we were started by a rush, a jump, and a surge behind us, and turned to see Will. Moodie come down out of his perch "like an Indian in the wake of a scalp," as old Cap. would say. He rushed at the boat, and with a tremendous "send" pushed it out into the lake, jumping in himself with not a word to us! He quickly got his seat and his oars, and then, that light boat sped over the waves and right before the gale like a thing of life indeed! We guessed where the deer must be from the direction in which the boat had gone. But for some moments could see nothing. At length, rising upon a huge wave, I caught sight of a pair of horns more than a mile away. A buck! and a big one evidently, was trying to cross the lake, and had accomplished two-thirds the distance when "Will." caught sight of him. I watched the boat through a capital field glass. A hard job "Will." had to turn that buck so near to shore as he was, and to force him to swim right in the teeth of that gale and those waves to our island! But at length I saw the buck "coming for us," with the boat two or three lengths behind him, with Moodie taking it leisurely. As they came near enough to enable us to distinguish them clearly, what a sight it was! The buck (a five year old one, as he proved to be,) strong and active, with a magnificent pair of antlers, breasted the wind and sea most gallantly! He seemed to swim on the top of the crest of the waves as they rolled by him, blowing out the water from his nostrils in little clouds of mist! Glorious old buck! How he rose on the wave with proud shake of his head, striking out boldly for liberty. Little did he know what eyes on his death intent were watching and admiring him from the shore he was struggling so bravely to reach! The boat following him was equally interesting to watch; very light at either end, the waves as they rushed under the bow would lift it up, and almost stand it on its stern for an instant, and then would let it fall into a seething shower of spray! And this continued all the way as deer and man struggled up to us! The "Executive" had never shot a deer! And we needed the venison very much, for there was next to nothing in camp in the way of meat! I really felt badly that there was a necessity to kill that buck. If ever buck had earned an escape he had! But there is little time to moralize about the matter, for here he comes within shot, and 'tis settled the "Executive" is to shoot him. We stepped out from the cover, "E." in advance, and as the buck caught sight of him he stopped and stared at him, and I mentally introduced the strangers—"Mr. Executive—Mr. Buck; Mr. Buck—Mr. Executive." They eyed each other for a moment; and the deer turning to swim off, up went the gun—a sharp report followed—the proud, defiant head fell, and it was all over. The "Executive" had made a sure shot and killed his deer without murdering it. Soon "Will." rowed up and then we finished the work. There was no beating that deer to death—no "tailing" him, and then shooting him, as a Brooklyn artist did. We needed the meat, and we used it. I do not feel ashamed of the work under such circumstances, nor does the "Executive," who has since decorated his dining room with head and horns of his first buck!

Late in the afternoon we returned to camp. "Jeemes," as philosophical as ever, had just got in, but had not seen nor heard of deer or dog that day. Louis had seen a buck, and pursued him in his boat, had shot at and wounded him but had failed to get him. But I have no doubt Louis found comfort in paraphrasing to suit himself the couplet—

"Better to have loved and lost
Than not to have loved at all!"

Woodland, Lawn and Garden.

WINDOW OR PARLOR GARDENING.

NUMBER VI.—THE FINISHED BAY WINDOW.

"Bring orchis—bring the foxglove spire,
The little speedwell's darling blue,
Deep tulips dashed with fairy dew,
Laburnums, dropping walls of fire."

WE again take up the subject matter of our last paper—"No. 5; or, Box Culture in the Bay Window"—on a more elaborate and varied form, and in this design show how for a small outlay any one may surround himself with plants of varying and changing foliage, giving the most beautiful contrasts. Our aim in the filling and grouping of this second box is to present a harmonious, unique, and somewhat novel and picturesque arrangement of quite a number of our common and rare plants—to associate together the broad leaf of the subtropical plant with the quieter denizens of the woods and gardens, and by a proper adjustment of soils and atmosphere make our own little family perfectly at home in their several relations.

We do not expect you will be able to do so with a first or even a second effort, for there is, we frankly tell you, not only considerable knowledge, but much careful patience, necessary to perfect success. Our own attempts to organize and unite a "happy family" of plants succeeded only after numerous trials, attended at first with indifferent success; but we in the end produced a pleasing and quite satisfactory result. You can do the same, and in order to aid you in the cultivation of these plants we give you the best results of our patient study.

In the culture of the parlor plants, and the peculiar arrangement of the same, our German gardeners, in many points, excel in their *modus operandi* almost any other nation. In conversation with a great lover of flowers, a successful German cultivator, he said:—"We make in Germany a very pretty garden in our deep windows with the

very commonest flowers, yet we gain one very grand effect with the different kinds of high colored foliage." I found upon further conversation with my German friend that he placed "all the good work," as he called successful plant growing, in a competent knowledge of how to prepare the soils. "Soils," said he, "lime, is everything to the flower," and although he could not speak good English, I found him to be a proficient in German gardening.

I had acted in accordance with the plan of German authority, although without having had any previous knowledge of their style of plant arrangement other than my own self-taught experience. I could therefore go on in renewed confidence with my own plan of contrasting strong colors with each other, being only mindful of the harmony of colors as given in paper No. 5.

At one end of this second box, near the cactus gallery, I placed a strong, small, fine root of the *maurandia* climbing vine; this should be well trimmed, as should all vines previous to planting. In the other end place a good plant of the Mexican colea, or, if you prefer, a small English ivy. Both these vines you can train over wires, arranged on the sides of the window, with fine effect. The further aim being to still keep up the contrast, you can place *pelargoniums* and *heliotropes*, and if you would have a grand effect place in the centre of your box of earth a *calladium*, and at its sides lower sized plants. There can be no grander sight in a parlor window than a choice *calladium* in the centre, flanked on each side with a vigorous growing *calla lily*. This accomplished, you can still very much heighten the picturesque effect by adding to your collection a few of the low growing *zonal* geraniums. Of these I would recommend the *Azucena*, salmon color; *Cylister*, bright scarlet; *Snowball*, pure white; *Lady Cullum*, and *Mrs. Pollock*, zone of red. These six flowers I have used as I have named, and blossoming, as they did, at nearly the same time, under the broad, expanded leaves of the *calladium* and *callas*, the beautiful effect can scarcely be conceived without being seen.

You can add much to the fine effect of your window plants, as they now stand, by procuring and placing in the second background a fine healthy root of the *Papaver orientale* and the *Papaver rhoeas*, oriental and French poppies. The manner of procuring these plants of the poppy for the winter window will be best attained by planting the seeds in small pots in the latter part of summer and growing them until cold weather, occasionally thinning out the plants; they can then, with care, be placed in the pots where they are designed to grow.

The oriental poppy makes a very grand show, and with care can be grown in the window to perfection, sending up a goodly sized clean stock, and developing into a magnificent flower, this root can be procured of the florists in the fall, and should be obtained at that time, as it is impatient of transplanting, though a hardy plant.

The French poppy, though rather an article cultivated for the opium of commerce, is nevertheless a very showy plant. The whole tribe, of which there are many, and very diversified in color, have the highly narcotic quality of giving sleep in a greater or less degree. It is this peculiar quality of the plant to which Shakespeare refers when he says—

"Not poppy, nor mandragora,
Nor all the drowsy syrups of the world,
Shall ever medicine thee to that sweet sleep
Which thou ow'st yesterday."

You will add the *Erimula chinensis* to your collection, or it will be incomplete. It is of all colors, and blossoms several months in the year. You will notice you are to keep the plants, all of them, in subordination to your middle, tall plants, as the *calladium* and *callas*. These should stand with their peculiar foliage above, and overtopping the whole of your box. Low plants, as the *sedum*, and a very pretty plant called "house leek" by the ladies, and all low creeping plants, can be used to good advantage in such positions, being always careful not to mass the plants in too great numbers, or have them all nearly of a height. Your window should allow you to look under the plants as upon their foliage. Here, just in this place, is where you will probably require the most care. If you fail, and the grouping does not suit your taste, try again, and if a second or third trial does not give you the desired satisfaction try again the fourth time, as it is a healthful sign that your taste for the beautiful and true is improving, and at last you must succeed, as you surely will. I could tell you how to produce a very pleasing effect at once, and you would do it undoubtedly, and then forget it immediately. It would not be desirable for me to make you a mere copyist when my desire is to make you a self-reliant florist.

Having filled to your satisfaction these two upper boxes, you can now proceed to place in the lower box, which we will suppose rests upon the floor, or but little raised from the same a larger class of plants, as monthly roses, azalias, and others, always putting the latter ones farthest from the front of the room, and the tallest of these you will in no instance permit to be of more than two feet four inches in height, so as not to cover up your plants from view in the second box. In this arrangement you can use the *lantanas* and some choice specimens of *carnation*. *Achyranthus* are, as a window garden decoration, a splendid addition to our green leaved plants. They are easily cultivated, thriving well at a temperature of from fifty to seventy-five degrees, and as your glass is always hanging at your window this is easily regulated. The *Linden* has the most splendid deep red foliage, each leaf being a study of itself, and there are few plants surpassing it in beauty.

You can now turn your attention, if you please, to the *Begonia* family, and here you may revel in a garden of de-

light. This may be called a wonderful combination of rare, curious, and unique flowers. They are of all kinds, shapes, and colors, and you have only to visit the florist to find ready potted for use any variety you may desire to place within your now nearly completed window garden. *Begonia rex* is the best variety grown in this country, being a very showy and picturesque plant, and is equally well grown in the parlor, conservatory, or greenhouse. Its leaves sometimes attain to a large size, and are beautifully marked with crimson. Some of them have broad, irregular silvery zones and curious spots, rendering them truly a most wonderful plant for the parlor, and worthy of all our care and attention.

In arranging this lower box much care must be had in keeping it open, so that you can let the very largest plants have ample room to develop themselves like trees in miniature, so that you can look under their leaves. If you wish to add in front some of the smaller plants, as violets and the like, you could probably find no finer study than the violets and mosses would yield you. Try it, and do not forget the rules of harmony of color, room, soils adapted to your plants, and untiring watchfulness.

In our next we will tell you something about sub-tropical plants and the aquarium as a study and an amusement.

OLLIPOD QUILL.

A GREAT CANAL.—The Grangers of California have devised a grand scheme of irrigation. It is proposed to construct a canal, commencing where the San Joaquin debouches from the Sierra Nevada, and carry it along the foothills, as high up as practicable, to Stockton. The object primarily to be obtained is the affording of a sufficiency of water to irrigate all the land intervening between the canal and the San Joaquin river, and at the same time to furnish a means of cheap transportation for the produce the large area of land will give to the country as a result of the irrigation. The great canal is proposed to be made 100 feet wide by as much as eight feet deep, large enough to carry boats of 100 tons capacity, and will be supplied with its waters from the following streams, which are situated as follows: 1. San Joaquin; 2. Fresno, about twenty miles; 3. Chowchilli, ten miles; 4. Mariposa, ten miles; 5. Bear Creek, eight miles; 6. Merced, fifteen miles; 7. Toulumne, twenty miles; 8. Stanislaus, nine miles; thence to Stockton, twenty miles—making 112 miles in all, though the actual distance is probably about 130 miles. Taking 130 miles as the length and twenty miles as the width, there would be 2,600 sections, or 1,644,000 acres, of nominally unproductive land, that would be rendered the most productive of any body of land in the world. The cost of the canal is estimated at \$13,000,000. The State will be asked to issue her bonds for the cost of construction, and the law providing for the canal will levy an annual tax of \$1 per acre on every acre of land within the above limits, also a tonnage duty of say twenty-five cents on every ton of produce passing through the canal, to save the State from expense. Each stream crossed by the canal shall be used as a feeder, and it is suggested that flume-feeders may be used, through which the timber, lumber, and wood bordering on those streams in the mountains can be floated to the canal, and thus reach a market otherwise impossible. As it is now, the crops being uncertain, the land of the entire district is probably not worth over \$5 per acre, certainly not more than \$10, whereas certainty of a crop every year, as irrigation would make it, would enhance it to \$30. This would make the actual enhancement of the value of the land \$16,440,000, more than the cost of the canal; and in less than ten years the productiveness of the land would enhance the value to \$70 or \$80 per acre.

Natural History.

NOTES ON THE GAR PIKE.

—We are gratified to receive this prompt reply to the queries of Prof. Baird respecting the gar pike. Doctor E. will accept our thanks:—

LAKE CITY, Minnesota.

EDITOR FOREST AND STREAM:—

For many years I have endeavored to study the fish in Lake Pepin; in many cases have been successful, while in others, have only been able to form theories. Thus with the gar pike, (*Esox belone*), I have never been able to discover for a certainty their spawning month, but I have arrived at facts satisfactory to myself, but which would not perhaps do to state as scientific truths. For instance, when we first begin our fishing in June, we frequently catch while seining for minnows, very small and young gar pike, say from two to three inches long. These, I have calculated, could not be over two months old. From this fact I am led to believe that they spawn in April, perhaps as early as March. Their spawning grounds are more difficult to determine. But in this, also, I am myself satisfied with my observations. It has been generally supposed that they spawned in sloughs or in the worst waters they could find. I do not believe this to be the case. For we get many of our minnows from the sloughs in the fishing season, and never get a single fingerling of the gar pike, as far as I have observed. I have observed the very young broods of almost all our fish, but I have never seen as a brood the gar or the shovel-nosed sturgeon. From all these observations I am persuaded that the gar, also the *accipenser* spawn on muddy bottoms in deep water.

I have repeatedly put the young gar into my aquarium, but have as often become disgusted with them, for if say six inches long, they will kill all my minnows. I once had in my aquarium a gar about six inches long. He was such a curiosity that I desired to keep him, but he soon began to destroy my other fish, and for the bad deeds he had done, I resolved to punish him, so taking a piece of very small silver wire, I tied his long jaws together, leaving them just enough apart so that he could breathe well. At this treat-

ment he was very much enraged, and would dart at every fish in the tank, and would nose and root them in every conceivable way—but they soon found out that their once dreaded enemy was now harmless. Thus I kept him fourteen weeks, when he passed in his checks, and young Mr. Gar was dead. There was now a regular jubilee among the other fish—they seemed to realize that their great enemy was dead, and such playing and frolicking I had never seen before among my finny beauties.

D. C. E., M.D.

WHY ALCOHOL CURES RATTLESNAKE BITES.—The experiments of Professor Binz, of Bonn, in regard to the effects of alcohol on animals, are exceedingly interesting, in as much as he seems to have discovered the reasons why alcoholic stimulants were so useful in cases of snake poisoning. He found that when decomposed blood was introduced into the veins of the living animal, all the symptoms of putrid fever were shown, the temperature increasing until death ensued. Alcohol reduced the heat, retarded the putrid process, increasing the action of the heart. This seems to be precisely the effect of alcoholic stimulants when administered in cases of rattlesnake poisoning.

A HINT TO ZOOLOGICAL COLLECTORS.

EDITOR FOREST AND STREAM:—

There are many collectors who work hard in the field and make large collections of animals, yet for mounting purposes many of their skins are worthless. When the skins are given to the taxidermist he has to soak them in a pickle until they are soft and pliable. If skins are not properly prepared, when subjected to the pickle the hair becomes loose and falls off when handled in mounting. It is essential that collectors should pay particular attention to preparing the skins of animals, particularly their heads. Many persons leave the whole fleshy parts of the lips on the skins when drying them. The result is the flesh first becomes putrid and then dries. When a skin is prepared in this manner it appears to be a good skin, but when it is soaked by the taxidermist the hair immediately falls off around the muzzle, eyes and ears, and it is impossible to replace it. To prevent such disastrous results, skin animals as soon as possible after being killed, and clean their pelts thoroughly. Those which feed on vegetable matter, such as animals belonging to the orders *Rodentia* and *Ruminantia*, should be dressed as soon as they are taken, and skinned as soon as an opportunity offers. During the summer months the coats of all animals are naturally loose, and every means should be employed to prevent the hair from parting with the skin. Animals of the genera *Felis*, *Lynx* and *Lepus*, have thin skins, which are quickly dried and preserved. But such animals as bears, wolverines, porcupines, large marmots and the *Cervus* family, need powerful preservatives, which will penetrate the skin quickly, thus preventing putrefaction. Small animals should be skinned below the eyes to the teeth, and have the lips split and rubbed well in pulverized saltpetre and alum, and have the feet and head primed with corrosive sublimate dissolved in alcohol or hot water, and the whole skin covered with dry arsenic. If the skins are to be mounted, allow them to dry in the open air as soon as possible. When turned inside out skins thus prepared look very poor to the collector, but the taxidermist would select them for mounting in preference to skins which had been returned, filled out and brushed up to a nicety. Large animals may be prepared in the same way, but should have the skull and leg bones removed from the skin, and the lean meat should be cut away from the lips, and the dark colored flesh on the margin of the lips be split and preserved. The preservatives should be crowded between the skin and bones, at the base of the hoofs, and should also be applied on the outer or fur side of the skin in similar places. The ears of large animals should be skinned half their length, the superfluous meat removed from the base of the gristly parts and be well primed with the preservatives. Pelts may be preserved successfully as above stated, in any climate or at any season; provided they are kept from being fly-blown.

J. H. BATTY, Collector,
DR. F. V. HAYDEN In charge. U. S. G. Survey.

BALTIMORE, January 27, 1874.

EDITOR FOREST AND STREAM:—

Do quail withhold their scent? Among sportsmen of my acquaintance there is the greatest diversity of opinion. If they do, and I incline to that opinion, is it an act of will, or is it involuntary and caused by fright?

Last November, when hunting in Virginia, one of my dogs pointed a bevy of full-grown birds in some brush. I put them up, killing one with my right-hand barrel and missing with my left. However, as I marked them down in a grassy meadow, about three hundred yards off, the noise did not cause me any special unhappiness. Without any delay I walked to the spot, a solitary bush around which I had seen them drop, and hunted every yard of the ground, both dogs working carefully, and I walking it over; finally the bitch pointed, and I put up the bird within a yard of her nose. I killed that and four more, the dogs getting almost over them before pointing. At the last shot the rest of the bevy, about twelve birds got up from the ground I had been hunting over. It was not more than twenty yards square and covered with thick grass about a foot high.

Had the dogs been strangers to me I should have blamed them, but they are both good, and the bitch has a remarkably good nose.

Hoping to hear from you, I am truly yours, G. H. M.

[After a bevy of quail have been once flushed they will fly say 150 yards or so and alight, huddling together, never moving, and scarcely breathing. The scent that comes from them is not perceptible even to the delicate nose of the finest dog; but let the same bevy rest awhile, recover their nervousness as it were, and begin to move about ever so carefully and they emit a strong scent. Mark down the bevy, and always wait a few minutes, keeping the dogs "to heel" before flushing them a second time. The scent is withheld, not from any will power, but because the birds are in a state of quiescence.—Ed.]

CENTRAL PARK MENAGERIE.

DEPARTMENT OF PUBLIC PARKS,
NEW YORK, January 31, 1874.

Animals received at Central Park Menagerie for the week ending January 30:

One Togue Monkey, *Macacus pileatus*. Hab. Ceylon.
One Red-shouldered Hawk, *Buteo lineatus*. Captured in the park.
One Mottled Owl, *Scops asio*. Presented by Mr. M. I. Hoff.

W. A. CONKLIN.

FISH BREEDING AT BURGHLEY HOUSE.

YOU will be glad to hear that I have just received a good remittance of ova from Mr. Robert Roosevelt, New York, through the kindness of Sir Edward Thornton. The ova have arrived in first-rate order, and are safely deposited in my breeding-boxes. Four boxes contain the ova of the *Coregonus albus* (white-fish), four of *Salmo amethystus*

(salmon-trout), and four of *Salmo fontinalis*. The ova of the white-fish seem to travel the least well of the three kinds, as there are many dead amongst them, while the other two sorts have arrived in perfect order. I could have some "Black Bass" sent over, but am afraid of them, as Mr. Roosevelt says that "the Black Bass (*Grystes nigricans*) is a fighting American, and will swallow every British fish in your lakes. It is our champion fish, and it can whip all creation of the fish race." After this description, I think that you will advise me to have nothing to do with such a devil, if I want to get up trout and *Salmo fontinalis* in my ponds. The fish hatched from eggs sent me by Sir Edward Thornton last year are doing very well, and are growing rapidly. They are principally salmon, white and big lake trout, with a few white-fish. I hatched a good number of the latter, but, unfortunately, lost most of them, through their escaping down the waste-pipe of the lower large tank. I had a guard of perforated zinc; but the little white-fish seem to work themselves through everything, and they got away, despite all my care and that of my servant, who is a very good hand at fish-hatching. The trout appear to grow rapidly; I have taken out several over one and two pounds weight this summer, while shifting my fish from one pond to another; and one trout was nearly three pounds in weight. These fish had only been hatched a year, or a year and a-half at most. Amongst them, I took out about one dozen very pretty fish, as bright as salmon, but different in form. They are broader than salmon, flatter in the sides, and the head is of a different form from either the above-mentioned fish or the trout. The scales were like salmon scales, but rather coarser. I am sorry now that I did not take fuller particulars of the fish before turning them into the ponds, and I cannot get at them now. Not having seen a full-grown American white-fish, I am unable to say if these fish are the same; but not having any white-fish spawn sent me the year before last, I do not think that my friends can be the *Coregonus albus*. Anyhow, they are very handsome fish, and they came in the ova from the other side of the Atlantic, and were hatched in my boxes here.

Enclosed I send you the observations made by my valet (Deane), while attending to the hatching of the ova sent me from various parts. The ova from Switzerland generally turn out well; but the sender should be more careful about the packing of the ova, which are often sent in too crowded a state.

—Land & Water.

Seth Green, Esq., has kindly inclosed to us the above paragraph, remarking that "the strange fish mentioned in Lord Exeter's letter in the *Land & Water*, January 10th, as above, is a hybrid between the Great Lake Trout and White Fish. The spawn of the trout was impregnated with white-fish milt. I hope Lord Exeter will take great pains to raise them for scientific observations, and will give us a full description of what they are like through some paper."

—A large number of valuable papers on Natural History accumulated within the past fortnight, are necessarily deferred until next week.—Ed.]

Fish Culture.

PRACTICAL FISH CULTURE.—No. 4.

THE AINSWORTH SCREENS.

THIS admirable contrivance for taking spawn, in a natural manner, is the invention of the Hon. Stephen H. Ainsworth, of West Bloomfield, N. Y., who has been called the father of fish culture in America, as he was the first to engage in it, whose experiments were successful enough to attract attention. The screens were first used by him in the fall of 1868, and by the writer in the following season.

They are not patented, neither are any of the other inventions of this gentleman, who has devoted many years to studying the habits of fishes, simply from the love of it, as becomes a true angler, who, while he delights to kill his game, has an eye to its increase and protection; and it is to be regretted that his limited supply of water, and its distance from his residence, combined with his poor health, should have prevented him from further experiments for the past three years; but as I will have occasion to refer to his place again under the head of "Ponds and Water Supply," I will proceed with a description of the screens, their manufacture and mode of working.

The race is, of course, at the head of the pond and should have a flat bottom and square sides of either stone or plank; ours, at Honeoye Falls, have stone sides and a bottom of hemlock boards; the depth of water at the upper end is six, and at the lower eighteen inches. Whether this sloping bottom is of any advantage or not, I cannot say, but they were built so because some one recommended it as being the best arrangement for a race where fish of different sizes resorted to spawn, giving the small ones a chance in water too shoal to be frequented by the larger fish, which may be good in such a case, but our different sized fish are kept in separate ponds. I have noticed, however, that most of the spawn is deposited near the centre of the race.

Our races are four feet wide, and the frames for the bottom screens are made of strips of inch pine, two inches wide; the frame is made three feet long and the width of the race, with a strip in the middle dividing it lengthwise into two sections, each 32 inches by 21; these are covered with wire cloth of eight wires to the inch; three strips are then put on over the cloth, on the middle, and side strips, so that they do not interfere with a flow of water under the screens, and will not allow the screen to sag to the bottom of the race.

The upper screens are put on boxes made of inch stuff six inches wide; they are made so that two of them just cover one bottom screen, resting on the middle strip; they

are three by two feet, outside measurement; these require to be stronger as they have to sustain the weight of gravel; they are covered with cloth of four wires to the inch.

Before putting in the screens for the season the race is swept clean of sediment; then a bottom screen is put down and held in place by one person in the water, who puts his foot on it; the top screen is then lowered with its covering of clean gravel by means of iron hooks, this holds the bottom one down; its mate is then put beside it. It is well to have spaces cut in the ends of the upper boxes for the fish to pass through at the upper end of the race, where the water is so shallow that the top of the box is out of water.

The hooks for raising the top screens are made of an iron rod bent in the middle to form a handle, and the ends spread to hook into two holes in the ends of the box. It will be seen from the above description that this beautiful invention is simply an artificial nest, invitingly covered with clean gravel to attract the trout to deposit their spawn, as we make a nest for our hens where we wish them to lay by putting some nice straw in a box.

The wire cloth being on the bottom side of the lower screen there is only an inch space between the coarse and the fine wire. The trout readily accept this bed, and their spawn passes through the top screen and is caught on the lower one, where it is protected from all harm.

To gather the spawn requires two men, one of whom has on rubber boots that come to the thighs; the board covering is removed from the top of the race and one operator gets into the water below the screens; the other puts a board across the race to stand upon; they then put the hooks in each end of a box and raise it just out of water and give it a souse back to wash out any eggs that may remain caught in the gravel; it is then deposited on the top of the race; the man in the water now puts his foot on the lower screen to prevent its buoyancy from lifting it too suddenly, when the other top screen is removed.

The bottom screen is now allowed to rise so slowly as not to wash over any spawn that may lie upon it, which is collected by sweeping it with a feather from a turkey's wing into a cribble made with turned up edges like a dustpan with a few small holes in the back to allow some of the water to pass; this cribble need not be over four inches wide and three deep; it must set flat and have a handle about six inches long at right angles to the bottom; this handle should be of wood, and the iron handle of the hooks should be wound with cord for comfort on cold days. Sweep up the spawn dirt and all, for it has to be washed afterwards, no matter how particular you gather it. These screens are then replaced and the next set removed.

This is a description of the manner that I have always worked them as learned from my esteemed friend the inventor.

There has been a device patented to save the labor of lifting the gravel, which I have seen at work, but wish to investigate a little more closely before giving an opinion of its merits.

Mr. Stone, in his work, page 36, says:—"There is some difference of opinion as to the question which yields the most eggs, the artificial or the screen method, and the results of some experiments of Mr. F. Mather seem to be adverse to the Ainsworth plan." This is a mistake, either of my meaning, or a slip of the pen, for I have ever advocated the screen system.

The only known objection to the screens lies in the fact that the percentage of impregnated eggs is not so great as by the hand method; but this, in my opinion, is more than compensated for in the amount of fish that can be raised from the same number of eggs when the young are kept in confinement. I have taken spawn in both ways, and raised the young, and can therefore speak by the card. I do not pretend to say that eggs laid on screens and impregnated in a natural manner, are any better than those taken by hand, if the latter are fully ripe; but I know, from experience, that of a lot of twenty fish caught to-day, and which are ripe enough to allow the spawn to be taken, some would not have deposited it for at least three days, perhaps a longer time might elapse, but it can be taken three days ahead of time; these eggs will hatch, and seem to do well up to the time of the absorption of the sac; then those who, like Macduff, came into the world from the womb, "untimely ripped," will weaken; their stomachs do not seem to be sufficiently developed to take the food that we offer; perhaps if turned loose they might find food suited to their weak natures and in time become lusty fish; but when we confine a lot of delicate young trout just beginning to feed, and give them strange food, none but the most robust will survive. For my part, I would prefer 20,000 spawn laid in the natural manner to 50,000 taken in the ordinary way by hand—by the ordinary way, I mean taking all eggs from all fish that will strip. I believe a fish will be stronger if the egg is left until the female lays it, than if taken two, or even one day before.

I am aware that this is an unpopular idea among the practical fish culturists, and one that we have had sharp discussions over in the "American Fish Culturist's Association," where I have defended it alone, but I believe and practice it; and the fact of its being unpopular will not deter me from preaching it.

The proper food of a trout for the first month or two after the absorption of the sac, is small insects and aquatic larva, which we cannot supply in quantity, therefore, we try liver, kidney, blood, egg, &c., and keep them crowded in boxes or troughs and the weak ones must go under, and what I claim for the screens is that there are but few of these.

In the hand operation about 90 per cent. is a good working average of impregnation, that is, taking the season through, for there will sometimes be a lot lost for want of milt, or a batch that for some other reason falls below the average. In some cases there has been as high as 99½ per cent. reached, but I think about 90 will be found to be the average of a whole season. My average with the screens has been steadily increasing from 75 when I first commenced, to about 85.

We cannot, of course, count all eggs and keep a record of every unimpregnated egg, but we take a vial full of eggs and note the percentage, then take a couple more vials full out of the same lot, and so average the whole batch. Several persons have written me about my method of managing the screens and complaining that they could get few or no impregnated eggs, and these have been the rules I have given, which may be relied on as all that I know about it; never dealt in secrets, but have always been willing to impart anything that I might know that would tend to advance fish culture, at the same time taking care not to tell more:

First, have the space between the upper and lower screen as small as possible, then the milt has a better chance of contact with the eggs.

Second, make the upper screens in the form of boxes, that the current will be obstructed, and the milt will be held in an eddy and not swept away; in the streams the trout often choose an eddy below an obstruction.

Third, use gravel from the size of a black walnut to a hen's egg, according to the size of the fish, and only one layer of it, no matter if you can see the wires; the fish don't mind them, they will sweep the gravel all in one end of the box and spawn on the bare wires; this brings the male fish close to the eggs.

Fine gravel is hard for them to roll on wire cloth, it lodges in the spaces and two inches of it would hold many of the eggs. I often find the gravel all in one end of a box and the spawn all under it, with not an egg visible where the wire is bare. I do not use a water pail full of gravel in a box of the size described; and fourth, have a board running the length of the race on top of the boxes, making two separate races, this prevents much fighting. All our screens were painted at first, but it fills wire cloths so much that it is objectionable; we now use tar from the gas works, thin it with spirits turpentine and apply with a paint brush; it is as effective in preventing rust, if not more so than paint; it flows nicely and is so thin that the wire screens are merely covered; it is better to do it before putting it on the frames, so that the portion covered by the wood, which is always the first to rust, will be coated; then roll the wire upon a stick and stretch it tightly upon the frames.

There is an advantage to the trout breeder in using the screens, other than stronger fry, this is; he is in no hurry if the weather is bad, while if he takes his spawn by hand he must handle some fish every day, or two at the farthest, or lose many eggs; and those who have shivered by the side of the race-way, holding a net with numb fingers, will acknowledge that it is a very disagreeable job.

We usually take spawn once a week, and have let it run ten days for a favorable time; a week is long enough for eggs to lay in as much sediment as is found on the bottom screens; and it would be altogether too long if the embryos were farther advanced, or the unimpregnated eggs had commenced to die and grow fungous.

Norris mentions a loss of eggs from some fish spawning in the night; if this be so, then it is another argument in favor of the screens. I have never observed anything to give me an idea that the brook trout ever spawns at night, as the salmon-trout does; still it is possible that some do, or Mr. Norris would not suggest it as a possible source of loss. There is yet another item of loss in taking spawn by hand, which is from some fish finding themselves continually disturbed in the race, seeking a more favorable spot in the pond to deposit their spawn. Therefore, taking these things all together, it is doubtful if there are many more fecundated eggs obtained by one system than the other.

FRED. MATHER.

—Large numbers of black bass have been taken from the Delaware River near Easton, Pennsylvania, within the last few days, chiefly in nets, weighing from one to three and a half pounds, and supposed to be the fish that were spawned in 1870. They were congregated at the mouth of a large spring that empties into the river, on account of the spring water at this season being so much warmer than the river water; as trout in summer gather there by reason of the spring water then being so much colder. Now that the time required by law for the protection of bass in the Delaware has expired, it may be hoped that the capture of these fish in nets will be forbidden. Indeed, it is intimated in the Germantown *Telegraph* that a law will be passed by the Pennsylvania Legislature this winter to this end. It is stated that these fish can be taken in nets only at night, or when the river is high and the water muddy. At other times they have the fashion of jumping over the cork line. This is a very sensible expedient, and we can only regret that the bass cannot see at night as well as in the day time. The *Telegraph* also notices that black bass have a wonderful tenacity of life. It says that some which were taken at ten o'clock in the morning "were carried two miles to town in a basket, sold and wrapped in paper, and then left in a warm room, and were alive at five o'clock in the afternoon. One man reports his were alive and kicking seven hours after being taken from the water, even after their entrails and gills were taken out! and what is more, that man

can be believed implicitly. The moral is, that these fish should be killed forthwith after being taken from the water from motives of humanity. Their flesh also would be improved in this way, rather than by allowing them to die a lingering death of many hours in the usual way."

—Young salmon have also been taken this month in the Delaware, probably of those planted in 1872. A useful bit of information may here be given to anglers who are not familiar with the appearance of these smolts, especially as so many streams have been lately stocked with salmon fry, which are liable to be caught by those angling for trout, and by them mistaken for trout. Smolt take a fly readily, and to a casual observer appear much like six inch trout, but a more careful scrutiny will show a marked difference in their livery, the smolt having a more metallic lustre, with spots of a more livid scarlet, while the minute scales are shed freely upon contact with the hand. The smolt is more slender than the trout, and the tail a trifle more forked. Old trout have tails nearly square. All smolts caught by the fisherman or angler should be immediately returned to the water if they be not too much injured to live.

—Only a short time since a Mr. Murray Hughes, of New Haven, Connecticut, while fishing with a net for frost fish near the steamboat dock, caught a young salmon about six inches long, and which probably hailed from the Connecticut. There can be little doubt that these instances, now quite frequent along the coast from the Penobscot to the Delaware, of young salmon being caught, are the initial results of the attempts to restock our rivers, and ought to not only encourage the Fish Commissioners, but convince the skeptical and obstinate who have ridiculed or directly opposed their efforts for so many years. In two or three years more we anticipate that the great and interesting problem will not only be solved, but that the living testimony will be overwhelming.

—Last August a black bass was taken near Easton which weighed seven pounds, and is supposed to be one of the originals from the Potomac.

A QUEER FISH.—The Revue Scientifique states that the aquarium of the Paris Jardin d'Acclimation has received a singular acquisition—a medusa (a sort of umbrella-shaped polypus, that swims with a stomach, mouth, and a number of tentacula under water), that had no sooner got into the compartment allotted to it, than it got rid of all its neighbors with wonderful rapidity. On analyzing the water, it was found to be impregnated with vinegar, which had caused the death of the inmates. The medusa in question, therefore, belongs to one of the rarest species in existence, which, owing to its faculty of secreting the acid in question, is called the "vinegar polypus." The curious point in the case is, that the animal in the first instance emits alcohol, which is only afterwards acidified, owing to its becoming diluted in contact with nitrogenized matter.

Answers To Correspondents.

[We shall endeavor in this department to impart and hope to receive such information as may be of service to amateur and professional sportsmen. We will cheerfully answer all reasonable questions that fall within the scope of this paper, designating localities for good hunting, fishing, and trapping, and giving advice and instructions as to outfits, implements, routes, distances, seasons, expenses, remedies, trails, species governing rules, etc. All branches of the sportsman's craft will receive attention. Anonymous Communications not Noticed.]

B. KING, Boston, Mass.—Write to W. Bonfield, Booneville, Oneida county, New York, enclosing your letter.

R. L., New York.—You do not state what kind of hunting you wish. For general shooting Warren and Elk counties, Pennsylvania. The expenses would be about \$3 50 a day, not including the car fare.

A. B. C.—I saw at 119 Main street, Brooklyn, on January 28th, two fine brook trout labelled "All the way from Maine." Were not these exposed for sale illegally? Ans. Yes; by the laws of both Maine and New York.

W. W., New York.—What are gun cases generally lined with? Where can the material be procured? What can I use so that it will adhere to the gun case? Ans. 1. Waterproof cloth of self color. 2. Any dry goods house. 3. Gum tragacanth.

JOHN C. C.—Will you kindly answer J. C. C. in your next issue of your valuable paper (the best in the country for a sportsman, not sporting man, to subscribe to) whether in playing draw poker a straight flush will beat four of a kind or not? Ans. Write to *Wilkes Spirit of the Times*.

W. E. T., Brooklyn.—Can you tell me where Rev. W. H. H. Murray resides? Ans. At Guilford, Conn., when not in Boston. Where can I get a correct list of provisions and the quantity required by two persons for two weeks? Ans. See "Sybilline Leaves" in *FOREST AND STREAM* Oct. 16. Where can I get a lantern suitable for jack or night shooting? Ans. Ask Mr. Murray; we are wholly opposed to the use of the jack. Will a conical bullet go farther than a round one, with the same amount of powder? Ans. It will. What is the cost of flies? Ans. From \$1 to \$5 per dozen.

C. W. A., Newark, N. J.—I have a pup, cross between a setter and a pointer. What do you think of the breed? Ans. They turn out well sometimes but will not stand the cold weather in the late fall. We trust that you crossed them for some special purposes, the pointer being deficient in some instinct that the setter possessed, or vice versa. Is it right to feed them with meal and food from the kitchen? Ans. You do not state age of the puppy. If it is weaned the food you mention will answer for the next three months; after that period it must be fed regularly, and with proper food. See *FOREST AND STREAM*. What is the best manner to train them? Do you approve of the plan set forth by correspondent "Homo"? Ans. Homo is good. Purchase "Stonehenge" and follow out his instructions.

WANDERER.—Can you give me any information about the sports by field and water in California? I get very conflicting reports. Some say that the salmon and trout there will not take the fly; others say they will. But I want to know when, where, and what fly. Some tell me there is famous shooting there; others that with the exception of water fowl and a few deer there is none. From some I hear that great sport can be had coursing hares; others say it is no such thing; that there is no sport there of any kind to warrant ones going prepared for it. Now I want to know what to expect and what to prepare for. Ans. Your questions cover too wide a range. California is a vast State, some parts of which are wholly destitute of game and river fish, and others abound in numberless varieties. Salmon and trout, in some parts lack game qualities, in others they are active and take the fly readily. In our next issue we shall print a most comprehensive article on this very subject, giving valuable information of the best game section of the State—information that we have never seen in print, though often asked for by anglers and naturalists.

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INDOCTRINATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Company,

103 FULTON STREET, NEW YORK

Terms, Five Dollars a Year, Strictly in Advance.

A discount of twenty per cent. for five copies and upwards. Any person sending us two subscriptions and Ten Dollars will receive a copy of Hallock's "Fishing Tourist," postage free.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices, 50 cents per line. Advertisements in double column 25 per cent. extra. Where advertisements are inserted over 1 month, a discount of 10 per cent. will be made; over three months, 20 per cent; over six months, 30 per cent.

NEW YORK, THURSDAY, FEBRUARY 5, 1874.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal letters only, to the Manager.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited.

We cannot promise to return rejected manuscripts.

Ladies are especially invited to use our columns, which will be prepared with careful reference to their perusal and instruction.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

CHARLES HALLOCK,

Managing Editor.

THE INTERNATIONAL RIFLE MATCH.

LETTER FROM MR. A. B. LEECH, OF THE IRISH TEAM—THE IRISH CHALLENGE TO THE NATIONAL RIFLE ASSOCIATION.

AT the annual meeting of the Amateur Rifle Club, in December last, the President, Col. George W. Wingate, was directed to address Mr. A. B. Leech, of Dublin, in regard to the challenge to American riflemen, published in the *Herald*, and accordingly wrote to Mr. Leech, requesting the particulars in regard to which the proposed match was designed to be carried out, and stating that it was the desire of the Amateur Club, not so much on behalf of themselves as on behalf of the riflemen of America, that a competition of this description should be had sometime during the fall at Creedmoor, at which American riflemen using American weapons should contend against an Irish team. In reply to this communication the following letter has been received:—

DUBLIN, No. 110 GRAFTON STREET,
THURSDAY, 16th January, 1874.
IRISH RIFLE ASSOCIATION.

DEAR SIR.—I have had the honor of receiving your letter of the 26th ult., which I have submitted to friends who are co-operating with me, and I am authorized to say that a formal programme on the basis of the challenge already before you of the proposed International Rifle Match will be shortly prepared, which I will be happy to submit for approval of your association. In deference to your suggestion I will, if possible, waive the 1,100 yards range, although to do so will, I fear, detract somewhat from the great interest of the match.

When I addressed the challenge to the American nation, through the columns of the New York *Herald*, I was not aware that you had a National Rifle Association, which you will please accept as my apology for not having addressed it in the first instance. I am authorized to say that my friends are highly gratified at the flattering terms in which you write. I have always considered that we cannot know too much of one another, and that whichever side wins in this great trial of skill and judgment, we will have an agreeable opportunity of improving the acquaintance, if not securing the friendship, of those we may have the honor and pleasure of being for a time associated with in your great country. Pray accept my thanks for your courtesy. I have the honor to remain your very faithful

ARTHUR B. LEECH.

Geo. W. Wingate, Esq., Secretary National Rifle Association of America.

From reading Mr. Leech's most courteous letter, it would seem that Mr. Leech speaks of the communication addressed to him by Col. Wingate, as if it were written by him as Secretary of the National Rifle Association. This, we

think, is an error. The letter, to which Mr. Leech refers, was written by Colonel Wingate on behalf of the Amateur Rifle Club, in pursuance of a resolution passed at its annual meeting in December last, (published in the *FOREST AND STREAM* of November 27th,) at which meeting Colonel Wingate, as its President, was directed to address Mr. Leech in regard to his challenge to "American riflemen," which originally appeared in the *Herald*, the National Rifle Association having taken no action in the matter.

In taking this step the Amateur Rifle Club did not by any means claim that in their members were included the best shots in America. On the contrary, it is their present intention, as soon as a definite programme is determined on, to publish a request soliciting the co-operation of marksmen throughout America, in order to secure a "team" fit to construct against the "Irish Eight," such "team" to be selected from the best shots that can be obtained, whether members of the Amateur Rifle Club or not.

It will be recollected that competitors—(under Mr. Leech's challenge)—must be native born Americans, and using rifles of American manufacture, weighing not over ten pounds, with a trigger pull of not less than three pounds, any sights being allowed but telescopic, the distances being 800, 900 and 1,000 yards. The original challenge contemplated a match at 1,100 yards, also; but this was objected to, as our range at Creedmoor is limited to 1,000 yards.

From the great interest that has been manifested in this challenge throughout the whole country, there can be but little question but that a match can be made that will be National in all respects. Such a contest must bring together at Creedmoor during the fall a team of representative men who will, we trust, sustain the traditional reputation of America as being the home of the rifleman.

SEVENTH REPORT OF THE COMMISSIONERS OF FISHERIES OF THE STATE OF MAINE.

IF the reports of the Commissioners of the States of Pennsylvania and New Jersey, conscientiously written by the proper officers, give a truthful but rather desponding aspect of affairs, expatiating fully on the wasteful and careless acts of the fishermen, and tacitly expressing a certain want of appreciation from the community in whose midst their labors are carried on, it is pleasant, when the reviewer concludes the examination of the Maine Report, to find that in this State much of the success the Commissioners have met with has been due to the *increased interest* taken by the people at large in the efforts of the State and Government to restore the former productiveness of the streams and lakes of Maine.

Messrs. E. M. Stilwell and Henry O. Stanley, the Fishery Commissioners of Maine, possess, it is true, certain advantages. In the first place they are not only admirable as to the theory of pisciculture, combining with it a sound knowledge of ichthyology, but what is a great desideratum, these gentlemen, being thoroughly acquainted with the use of all the devices employed for the capture of the trout and salmon, in a word consummate anglers, have evidently brought their skill into play. Something, in introducing novel measures into a community, depends more or less upon the personnel of the functionaries, and in the present instance, there is no doubt but that Messrs. Stilwell and Stanley have, by their presence and eloquence, done a great deal to teach people not only the usefulness but the necessity of their calling, and have thus gained the aid and confidence of the people in the State. We have frequently thought that it would be a great adjunct to the success of State measures tending to the preservation of fish if a series of simple monographs of the most elementary character were published and distributed gratuitously, describing fish with an illustration or so, and explaining the objects of the Fish Commissioners, and giving the figures, showing how the country was getting impoverished through want of the simplest care, and how it might be enriched by the slightest modicum of common sense. We believe that some thousands of loose sheets of this character, written in a popular and lively style, would reach home, and prepare the ground most thoroughly for the future works of the Commissioners. In Maine there appears a disposition on the part of mill owners, using water from streams capable of producing and rearing fish, not to throw unnecessary impediments in the way of the Commissioners, but rather to aid them. We note then, with pleasure, that owing to the prompt energy of the Cabot Manufacturing Company, a substantial stone fish way has been erected on the Kennebec, near Brunswick, and that other manufacturing companies have agreed to do the same work. In fact, from all the sites on the noble Kennebec and Penobscot, similar aid is promised, and already, in a great many cases, such fish ways have been constructed, so that not only salmon, but the shad and alewives now have a chance of entering the rivers of Maine. Of course the refuse from cotton and paper mills is aserious detriment, as it pollutes the streams, but the Commissioners hope that some measures may be provided to keep this poison out of the rivers during the breeding season or that of the migration of fish. The information given to us in the report in regard to salmon is more than satisfactory. In Maine salmon have made their appearance in localities where they had been long considered as extinct. Salmon have been seen and captured last year as far up the Penobscot as Pleasant River. At Vanceboro', Mr. Stanley himself caught a salmon, and the Commissioners are well satisfied that a large number of salmon have succeeded in reaching the sources of the Penobscot and have spawned there. As far up

even as Chesuncook Lake—and even beyond it, smolt were taken in the second year. In the East Branch, last summer, as far as Grand Falls, yearling salmon were found, specimens of which were sent to Professor Baird, of the Smithsonian Institution. Now just here would come in most usefully the information in the way of easy instruction which we have advanced—the distribution of some primary lessons about fish adapted to the use of ignorant people. About Grand Falls, the people were catching the young salmon and calling them trout. Perhaps the term ignorant is rather too strong a one, for it is not every individual, though he be educated, who can nicely discriminate between the various forms of that protean fish the salmon, whether he be as a parr, a smolt or a grilse.

The advent of the salmon so far inland, the Commissioners think, is due to the fact of there being good efficient wardens on the rivers, and quite as much because of the friendly sympathy and co-operation of mill owners, who have aided in keeping the fish-ways clear, and mostly because of an *improved state* of public opinion and an *increased interest* the people generally have taken in these subjects.

Between Bangor and Oldtown, last year, a number of fine salmon were captured; whole number up to July 23d, 1,984, with an average weight of 16 pounds. Total weight, 33,198, worth \$5,504. About the biggest fish weighed 32 pounds. On the Kennebec the accounts of the salmon are quite as reassuring, an increase in quantity and quality of fish having been noted. Barring some slight accidents to the salmon spawn, the hatching has been fairly good at the Bucksport Salmon Works, and some 300,000 salmon fry were divided between the waters of the Penobscot and Androscoggin Rivers. It is again pleasant to notice that railroad corporations have given the Commissioners their aid in distributing the small fish. Nothing can be more to the interests of railroads than to encourage in every way the movements of the Fish Commissioners. A good angling ground induces travel, and with care from small beginnings the salmon fisheries may undoubtedly in time assume a commercial aspect. Another incident worth recording is, that the Honorable W. H. Venning, Inspector of Fisheries of New Brunswick and Nova Scotia, and Mr. Deputy Curran, have given material aid to the labors of our Maine Commissioners.

The Commissioners, quite wisely, we think, have been chary of the indiscriminate permission to be allowed to all parties to take the spawn of landlocked salmon, and while desirous of aiding other States and the public all they can, they cannot entertain, for a moment, the idea that the fisheries are to be destroyed by unprincipled or ignorant people. A proposition was made to the United States Commissioners of Fisheries, and to the Commissioners of the New England States, to found an establishment for the propagation of fish at Sebec Lake similar to the one at Bucksport, and in August last it was decided, after a careful examination, that one should be made at Sebec, and everything is now in order for future work. Of course Maine, from her noble rivers and lakes, having within herself all the most choice places for salmon nurseries in the United States, must be the most conspicuous of the fish-raising States, and from thence fish-stock, we trust, will be had in plenty.

Consignments of the ova of California salmon have been received through Mr. Stone, a gift from Prof. Baird, and the fish will be placed in some lake or stream running into the Penobscot.

In the supplementary report of Mr. Charles G. Atkins, who has in charge the Bucksport Salmon Breeding Works, a most practical and simple exhibit is made how the salmon are stripped and the ova are treated, and in the paper can be found how the cost of ova has been reduced from \$44 per thousand in 1869 to not more than \$3.40 this last year. This establishment now ranks in its appointments, as in its productions, among the first in the world. Last December two millions and a quarter of eggs laid in the hatching troughs, and when put to their capacity they will contain over 4,000,000.

It is only this year that a thorough series of experiments in shad hatching were inaugurated, 100,000 young shad having been produced, and it is hoped that their introduction into the Kennebec, and about the same quantity into the Penobscot, will be attended with the best results.

The Commissioners write in the most sensible way in regard to the question of fish as food, as capable of provisioning a large portion of the State, and refer to the waste of animal life in Maine as a sufficient lesson of how improvident man is, and they state that "no good law, however popular, can ever be enforced without the sympathy and aid and interest of the whole people, and that the masses must assist or our laws will never be obeyed." They believe in the necessity of protection for both fur and fin, and ask the legislature to constitute Commissioners of Fisheries and Game. A most scathing rebuke can be found in the report, directed not to the lazy vagabonds, who, too indolent to work, exist by catching fish at improper times and when half grown, but written for the edification of those un-sportsmanlike people, far worse than pot hunters, who, when in a trout stream, keep on fishing until they have left not a fish in the stream. "Sir," said a guide, describing the soulless conduct of one of these parties, "at one time we buried more than 200 lbs. of trout that they had killed; they would have killed the last trout in the river if they had known where to find it." Of course no legislation can meet offences of this character, called by the indignant Commissioners "a shameless abuse of the hospitality of the State." The remedy lies in newspapers publishing the names of all such vulgar people capable of such malfeasance

and branding indiscriminate, insatiable fishermen as wanton destroyers.

Occasionally trout are received from Anson and other towns in Maine, which find their way to New York, which have been caught out of season. It would be wise for the Commissioners to correspond with parties in this city, whom we have no doubt would do their best to find out who receives the fish here, and who would not hesitate for a moment in bringing the offenders up with a round turn. Smelt fishing, Messrs. Stilwell and Stanley think, require additional jurisdiction. After March 15th it is lawful to catch smelt with hook and dip net. It is suggested that the net be prohibited after March 1st. The lobster business (frequently referred to by the *FOREST AND STREAM*), is waning on the coasts of Maine, and the Commissioners propose restricting the catch as to time, especially in July and August, during which months, exactly, the critical period of lobster spawning takes place.

In concluding this most interesting report of the Maine Fishery Commissioners, it impresses us as the work of conscientious men, who have had their soul in the enterprise. We must express the pleasure its perusal has given us, and the satisfaction we feel, when we can assure our readers that it is to Maine that they may look for the true fish nurseries which must supply, in time, no considerable portion of the whole country, not only with excellent sport, but with solid and wholesome food.

A TERRIBLE WOLF.

NOTHING delighted Louis XV. so much as the chase. Besides being a huntsman of superior merit, combining the finest theory with absolute practice, Louis XV. gave to this noble art all those finer and more delicate shadings which those pompous times allowed. When not engrossed in the cares of state, or absolutely in the field, the music of the hunt, the study of those melodious sounds brought forth in the hunting horn, occupied his royal attention. Several calls of his composition are extant, and what is called "La Louise Royale" and "L'Azur," still sounded at hunting meets, owe their origin to Louis XV.

But the revolution destroyed all hunting in France. The mad thirst for blood went even so far that not only the noblest of hunters but their poor dogs were sacrificed. Some anecdotes of this period are most interesting. The republicans seized on every pack of hounds they could find and pitilessly killed them. In order to save some few of their choicest breeds their unfortunate masters cut the dogs' tails and lopped their ears, thus transmogrifying a stag hound into a watch dog. There was a certain pack of wolf hounds celebrated for their courage and speed during fully three centuries, which was almost totally destroyed by the *sans culotte*. Fortunately, two or three of these animals were saved, after being docked and cropped. On the return of their masters to France, in 1803, these solitary individuals of the canine race who had, during fully ten years, been forced to undergo the most degrading purposes, were discovered, and the race was miraculously preserved. From these dogs the famous pack of hounds belonging to the Count de Cantelau owes its origin. Occasionally an exception was made by the followers of Danton and Robespierre, for M. du Hallay barely escaped the guillotine from the fact of his having destroyed a thousand wolves.

There is a curious story about a terrible wolf, which is recorded among the hunting annals of France, which we see repeated in the columns of our French contemporary. All kinds of diabolical stories are told about wolves, which, strange enough, are repeated in all languages. Our own Indians love to tell stories of a certain terrible medicine wolf, and the Gallic *Loup Garrou*, and the Saxon Wier Wolf, all undoubtedly spring from one and the same origin.

All Avergne, in France, about one hundred and ten years ago, was ravaged by a wolf, who rejoiced in a particular name of his own, and was called the Terror of Gévaudan. Such was the havoc he made among shepherds and flocks that the Evêque of Mendi had a solemn service held in the cathedral, with prayers, imploring the Divine Mercy to spare the men and cattle in the country. The wolf was alleged to have killed and devoured no less than ninety-three people, and to have mutilated twice that number of human beings. Louis XV. instituted a grand hunt for this wolf's especial benefit, and twenty thousand wolf hunters are said to have been put upon his track. Huntsmen and hounds from Italy were added to the French contingent, and the princes of the blood Royal, Condé, Orleans, and Penthièvre sent all their hunting equipages. They chased and they ran this wonderful wolf for a whole month without success. Once he was wounded, and swam a river, but this only seemed to make him the more ravenous, for shortly afterwards (so says the chroniclers of the times) he recommenced gobbling up children, women, and sheep in the most wholesale way. At last, on the 20th of September, 1765, close to the royal abbey of Chazes stood the famous hunter, the Chevalier Antoine de Beaulieu, the king's own rifle bearer, or *porte-arquebuse*, as that important functionary was then called. Antoine fired his blunderbuss at the wolf (so reads the French account), and down went the wolf, only to spring up again with redoubled fury, intent on making a Red Riding Hood out of the redoubtable Chevalier. As an oyster would he have been swallowed had it not been for a certain M. Reinhard, who came up just in the nick of time and killed the wolf outright with his gun.

So goes the story. We have before told our readers about the wolves which seem to abound in certain parts of France—perhaps the descendants of this classic wolf—who

took twenty thousand men to kill. Perhaps a few western hunters, armed with Remingtons or Sharpes or Burtons, might settle the business for the majority of these mutton eaters. We simply suggest this method to our most worthy French contemporary, *La Chasse Illustrée*.

THE KENNEL CLUB CODE OF RULES

IN printing the "code of rules for the guidance of field trials of sporting dogs, adopted by the Kennel Club in England," we do so simply as a guide for the benefit of all sportsmen's clubs throughout the country, and especially for the New York State Sportsmen's Association, and the Prairie Shooting Club of Chicago. These rules and regulations were determined on last fall, and if we are not mistaken the Kennel Club of England hold entire jurisdiction as regards making the laws for field trials, as to usage of guns, dogs, and *workers of dogs* in the field. These laws have nothing whatever to do with the formula that may be agreed upon by both parties in the Anglo-American field trial match.

We would suggest that, by all means, the sportsmen of America should form in New York an organization similar to the Kennel Club of England. The advantages of it are so numerous and so readily understood by all sportsmen that we do not think it necessary to expatiate upon it. We have already been in correspondence with several prominent gentlemen, owner of sportsmen's dogs, as to making the preliminary arrangements, and we have their entire support as to the founding of just such a kennel club in this country.

To return to the differences in marking the merits of dogs as advised by us, it will be noticed that *retrieving* is not taken into consideration in a field trial in England (see account of Mr. Price's shooting in Wales) as a distinctive feature, nor are there any points allowed, nor do the English sportsmen as a rule train or expect a dog to fetch his bird. Gamekeepers are frequently employed to hold retrievers in leash, who loose them when a bird is to be fetched. In the United States a setter that will not retrieve a snipe or woodcock, or fetch his bird or bring it in in good style, without mauling, would be considered by us as but half broken, and would deteriorate in price in the estimation of the purchaser fully 50 per cent. Almost the first question that is asked when a gentleman is about purchasing a setter in the United States is, "will he retrieve?" The answer generally is, "he retrieves first rate." To conclude our remarks on this important subject, trusting that our suggestions may be thought of use to the interests of our sportsmen, without any false braggadocio on our part, we believe that an American bred setter taken out for a day's hard work has more bottom, and will last longer, and work stauncher at the end of the day, and will be in a better condition for the next day's shooting, than an English bred setter. We are glad to see the New York *Herald* agrees with us on this point.

It has been proposed by us to allow ten points for retrieving in the Anglo American match, reducing the *pace and style of hunting* from 20 to 15 points, also the *styl and steadiness of pointing* from 15 to 10 points, for the reasons that will be read in our columns elsewhere, to which we would direct attention.

The gentlemen who have entered their dogs conditionally in the Anglo-American match will please state whether these alterations in the marks of excellence in the setter will suit the different clubs they represent. We feel satisfied that the English party will listen to almost anything in reason in the way of modification of their laws to accommodate American sportsmen, who will have to travel so far to test the merits of their pointers and setters in comparison with the English bred dogs.

CODE OF RULES FOR THE GUIDANCE OF FIELD TRIALS OF SPORTING DOGS, ADOPTED BY THE KENNEL CLUB, 1873.

1.—ELECTION OF JUDGES.—The Judge or Judges shall be elected by the Committee of the Meeting, and their names shall be announced simultaneously with the meeting. When a Judge, from ill health or any other unexpected cause, is prevented attending a meeting, or during a meeting finishing it, the Committee of the Meeting shall have the power of deciding what is to be done.

2.—DESCRIPTION OF ENTRY.—Every subscriber to a stake must name his dog at or before the Draw, and must give (if known) the name of the sire and dam of the dog entered. The Secretary shall publish on the card the names of those who are subscribers, but do not comply with these conditions. These nominations shall not be drawn but must be paid for. Any puppy whose pedigree, marks, or color shall be proved not to correspond with the entry given shall be disqualified and the whole of his stakes or winnings forfeited.

3.—ALTERATION OF NAME.—If any subscriber shall enter a dog by a different name from that in which it shall last have run, or been exhibited, without giving notice to the Secretary of the alteration at the time of entry, such dog shall be disqualified. The Secretary shall (if the conditions of the rule be complied with) enter on the card the late and present name of such dog.

4.—NOMINATIONS.—Any subscriber taking an entry in a stake, and not prefixing the word "names" to a dog which is not his own property, shall forfeit that dog's chance of the stake. He shall likewise be compelled to deliver in writing to the Secretary of the meeting the name of the *bona fide* owner of the dog named by him, and this communication shall be produced should any dispute arise in the matter.

5.—DEFAULTERS.—No person shall be allowed to enter or run a dog, in his own, or any other person's name, who is a defaulter for either entries or stakes.

6.—POWER TO REFUSE ENTRIES.—The Committee or Stewards of any meeting may reserve to themselves the right of refusing any entries that they may think fit to exclude, and no person, who has been proved to the satisfaction of the Committee to have misconducted himself in any way in connection with dogs, dog shows, or dog trials, will be allowed to compete in any trials that may be held under the Kennel Club Rules.

7.—OBJECTIONS.—An objection to a dog must be made to the Stewards or Committee of the meeting at any time before the stakes are paid over upon the objector lodging a sum of £5 in the hands of the Stewards, Committee, or the Secretary, which shall be forfeited if the objection prove frivolous. The owner of the dog objected to shall be compelled to deposit equally the sum of £5, and to prove the correctness of his entry. All expenses in consequence of the objection to fall upon the

party against whom the decision may ultimately be given. Should an objection be made which cannot at the time be substantiated or disproved the dog may be allowed to run under protest; but should the objection be afterwards substantiated, and the winnings have been paid over, the owner or nominator of the dog may be disqualified, shall return the money or prize, and shall be declared a defaulter.

POLLUTION OF RIVERS.—In the report of the Fishery Commissioners of Maine, it will be found that in certain cases the poisoning of the streams from mill refuse is exciting their attention. In England the River Pollution Commissioners, Prof. Frankland and Mr. J. C. Morton, have just furnished an interesting report, having made many thousand analyses, and having tested the refuse waters coming from chemical dye, print, paper, cotton, and paper mills. In England the pollution of rivers is rather a question as affecting the sources of drinking water than as to the detriment to fish, though this latter point is by no means overlooked. With the English commission the information sought had for its object the determining to what an extent purification can be pushed without detriment to the industry of the particular district where such manufactures are carried on. The English commissioners give certain standards as explaining what waters are to be designated as polluted, such data resting in the visible traces left by water, others attainable by chemical tests and analysis.

Questions of the pollution of rivers, and how to prevent it, are as serious as they are difficult to manage. To us, looking only to the possible destruction of the fish, we should suppose that establishments using chlorine for bleaching materials, as in cotton or paper mills, or employing dye stuffs, might in some cases during the fish breeding periods, or that of migration, store up their waste matters, and only allow them to flow into the rivers at times when such pollution would do no harm to the fish. Then, again, processes might be found by which the waste matters could be desiccated, and in solid bulk be placed in the earth and not in the water.

We frankly confess that as yet we do not see our way clearly in regard to this subject of the pollution of our rivers, and think, with *Nature*, that it is one of those questions of social economy most difficult of solution.

ENTERPRISE IN SOUTH AMERICA.—We learn from a correspondent, who is at this time located high up in the mountains at a place called Vilcomayo, 14,538 feet above the level of the sea, that "your paper, the *FOREST AND STREAM*, together with some others, lie cosily upon my table. I am rejoiced to greet your paper, and to read from the same your well known articles. I may give you an item by and by upon agriculture in the valleys and the mountains. We have here papers published at Puno, the *El Ciudadano*, and one at Cuzco, the *El Herald*. Both of these papers are well executed every way, and it may seem to you like an item of news, indeed, to know that both the news sheets are being published more than 12,000 feet above the level of the sea. These are by no means the highest aspirants for newspaper fame. At a place called Cerro de Pasco, 14,000 feet above the sea, a wide awake, clever gazette, devoted to the science of mining, matters and things in general, and the muses, is regularly issued." Speaking of a place, Vilcomayo by name, the writer says: "Here high up in the Andes is a genuine American hotel, two stories high, with a 'piazza,' and some forty rooms for the accommodation of tourists and the railroad people who come this way. Here are all the necessary requisites for the railroad, such as machine shop, engine houses, and laborers' cabins for the many hundred men employed upon the same. Just imagine that these are called the 'Yankees of South America.' There are Chilians, Bolivians, Peruvians, whites, Indians, ladrones, blacks, and once in a while the Chinaman."

INDEX.—The present issue—No. 26—completes the first volume of *FOREST AND STREAM*, and we are accordingly preparing an index of the same, to be mailed to our subscribers with the forthcoming No. 28. The index will be especially arranged with reference to classification of species, subjects, localities, characteristics, etc., and will constitute a key to a work of reference which must be greatly valued not only from the great variety of topics presented, but from the comparatively new ground covered, embracing, as it does, the entire geographical range of the United States and Canada, with other districts more remote. We should advise that the volume be bound immediately upon receipt of the index.

THE ANNUAL MEETING of the American Fish Culturists' Association will be held at No. 10 Warren street, this city, on the 10th of February instant, as already announced.

We are requested by Seth Green, Esq., to state, in view of the written desire of a large number of gentlemen to meet him here, that he will be found at the meeting as above, where all who wish to "talk fish" can not only button-hole him, but other leading pisciculturists, to their hearts' content.

—We have the best authority for stating that our most distinguished soldier, General Sherman, has expressed himself in the most complimentary way in regard to the National Rifle Association, and the management of Creedmoor, and as fully appreciating in a military point of view the advantages of the general rifle practice movement now commencing in the United States.

—Dr. Wm. B. Ball, of Chesterfield, Va., late Fish Commissioner of that State, died last month in the fifty-sixth year of his age.

Sporting News from Abroad.

ONE cannot help animadverting with some regret to the character of the correspondence one sees in leading English papers devoted to the annals of field sports. The remark would be too sweeping should we state that a discussion in England on questions of dogs, or game, or guns always ends by being of an acrimonious character, but we are forced to declare that a simple difference of opinion in regard to the various sides a question may be viewed from, too frequently engenders an amount of recrimination which concludes with allusions of a personal kind somewhat coarse, and with a careless use of epithets which we cannot but regard as uncalled for. We must do our elder brethren the justice to state that assertions made by them are rarely or ever advanced without a good deal of reason, and it is safe to say that before making a statement of facts they are always most careful in regard to their authority. A Frenchman may make up his history of the camel from a visit to the Jardin des Plantes; a German eliminate one from his inner consciousness, but it is the Englishman who will go to Arabia or to Sahara and become a camel driver himself before he is ready to print the facts in regard to this animal. We have sometimes endeavored, and fruitlessly, to try and find out why Englishmen were so rough in print and quarrelled so savagely, just as soon as ink is spilt. We have a theory that your average Briton rarely sees himself in type, and that when he gets there he hardly knows how to behave himself. In the United States, where the columns of a newspaper are so easily accessible to every one, (where perhaps quite unfortunately people find themselves too often into print when they don't want to get there,) it is considered very much more of a common event, and the custom of the thing has taught contributors, when they advance opinions or differ from others, to do so in a courteous way. We may be rather uncouth in the *vis a voce* way, but when we write, remembering that *scripta verba manent*, though we may think daggers, we are careful to put them in velvet sheaths, so that the readers can handle them without cutting their fingers. Of course men will differ in regard to a gun, a rod, a dog or a horse, or a fish, but without adopting the forced methods of super-Chinese civility; there can be no use in being vituperative about these matters or for calling hard names.

—Would any of our readers like to go to Unkomofiaze or to Limpopo? Of course everybody knows where those happy hunting realms are. It is the land of the elephant and the rhinoceros, where hippopotami, giraffes, lions, gnus, elands, koodoes and panthers abound, somewhere in Mid Africa. Such is the want of hunting opportunities in England that people advertise these unknown countries and get up parties to enjoy sport there. Perhaps the Messrs. Cook the great tourist guides will undertake pleasure trips of this character at some future period. Why cannot we be imitative to a certain extent? We think if a well known hunter (we could mention a score of such) knowing the ground well, would start at the proper season from New York an expedition of this character toward the Rocky Mountains with grizzly bears in prospective he might soon collect quite a number of enthusiastic sportsmen who, under his guidance, would see no end of sport, and have as an excitant the chance of a neat brush with the red men.

—We have several times noticed the tiger killing in India with its various English interpretations. So far we are pleased to state this correspondence has been of the most approved parliamentary character. "Smoothbore," the well known correspondent to the *London Field*, has an excellent communication on this subject. The writer is doubtful whether tigers kill more human beings now than they used to. Deer and pigs are, it is stated, the natural food of the tiger, "but," says "Smoothbore," "when by every means, fair and foul, in season and out of season, these are killed by the natives, the tiger is forced to fall back on the bullocks and buffaloes." Now when he kills the latter, which animal belongs to the natives, these stupid natives, says Smoothbore, have not even the sense to allow him to eat the carcass. The sequence now follows; tigers being driven away by the man, he tries to see what kind of a dinner a native will make, and finding much to his surprise and pleasure that a man is good eating, and not hard to kill, he becomes a *homophogist*, i. e., a confirmed man eater. The whole question is a strange one in animal economy, and reminds one of the endeavors to carry across in the same boat the wolf, the goat and the cabbage. The same thorough authority states that the Coimbatore district is noted for its man-eating tigers. In 1870-'71 they ate five human beings and 1,258 cattle; but in 1872-'73, 108 human beings and 1,509 cattle. It seems to us the appetite increases in what it feeds on, and that the more cattle they eat the more men and women they devour. "A method proposed to get rid of these man-eating tigers is advanced by a Major Beddome. This gentleman advises raising companies of volunteers, armed with rifles and muskets, and opening a regular campaign against the animals, the tiger corps to be prepared in every way for field service with tents, baggage, supplies, &c.

—In *Land and Water* there is given the experiences of a gentleman who was attacked by a mad dog and the method he employed to cure certain animals which had been bitten by the dog. Three horses and a cow were bitten by the dog. Some were treated with nitrate of silver, and one with the nitrate acid of mercury. Two horses and a cow treated with lunar caustic (nitrate of silver) all died in the

most fearful agony, while a mare, the property of the gentleman who writes the account, which had had the nitrate acid of mercury applied to her wounds has so far suffered no inconvenience. A fact of this character is most worthy of notice, and we are glad to give it publicity. It might be fully worth while to give the nitrate acid of mercury to persons who might have been bitten by a dog supposed to have rabies. In the case noticed by us the dog was a Newfoundland. We are chary of Newfoundland dogs. From a careful study of this subject, notes of which we purpose to publish some day, in regard to the species of dogs most prone to have hydrophobia, we are forced to place this fine dog, the Newfoundland, in unfortunate prominence.

—Where is Stawell? Who knows where Stawell is? Stawell, where the Australians have played their Olympiad game of cricket, and where the Stawellians beat the Grace Eleven, making the second defeat the vaunted boatsmen and bowlers and fielders have met with on the Island Continent. But so it is, and cricket men all through England hold down their heads, and are listless and moody, and believe now in the New Zealander or Australian looking at the ruins of Lord's Grounds of London and the Waterloo Bridge. The news is brief; we give it in all its impressive brevity. Mr. W. G. Grace's Eleven vs. Twenty-Two of the Stawell club, which began on the 9th was completed on the following day. The eleven went in first and scored 43 runs against 71 Stawell. Particulars of the second inning are wanting. The result, however, is stated to be in favor of Stawell, who won the match with ten wickets to spare. All Australia ought to hold a grand *corroboree* in approved native style. Our own clubs in New York had better profit by the example, for from the far West looms up a club which this season, we are inclined to think, will reap all the laurels. Of course, Missouri is not as far off as Australia.

—Dogs are dogs, and represent, when good ones, no small amount of money. A twenty-five hundred horse certainly means both beauty and speed, but a £500 setter must stand for something canine worth almost his weight in silver. Yet the *Irish Times* says £500 was offered for the celebrated red and white setter, Dash. This dog hails from Ireland, and is the property of P. P. Stone, Esq., of Coleraine, County Derry.

—The exportation of English horses must be decreasing. The price at home evidently must meet the views of those wishing to dispose of their horses. In 1872 the value of such animals sent out of England was £180,082; for the last year it was not half of it, only £76,442.

The Kennel.

FIELD TRIAL RULES TO SUIT AMERICAN BRED SETTERS.

BEFORE our gentlemen sportsmen enter into competition with the English pointers and setters in a field trial in England, there are many matters of marked importance that we should wish to bring to the attention of our readers.

1st. We would suggest that a slight alteration be made in the marks of excellence as regards points.

2d. That the introduction of retrieving should receive special notice as being of great benefit to our sportsmen.

3d. That if a dog in a field trial retrieves a bird, having worked a long distance on his marked bird, it should be considered and allowed that this educated instinct in the setter is worthy of several points in a field trial.

We offer these suggestions for these reasons: Taking the setter as being undoubtedly the most useful dog over game birds for our country, the power of scenting game, or the strength of nose, in a pure and well bred setter is simply a question of inheritance, which no doubt may be slightly improved by patient and careful practice. The nose being the most prominent characteristic feature in the setter, the rules very justly give to "scent" the highest number of points, namely, 30. Pace and style of hunting are almost wholly embodied in Breaking, the style and staunchness in Pointing, and Drawing on game; these several grades of merit have already, by the rules and regulations of field trials, their average points allotted to them. Pace in ranging, and the style or manner in which the setter beats the ground, are inherent in the animal, and may be much improved by constant education and training. As for instance, take nine out of every ten dogs into the field of those which are commonly called *thoroughly broken*, and they will range or beat, and run over the ground in a most excited and erratic manner. Breaking and dropping to "word" or shot, is a matter which rests almost wholly with the master, and it depends upon the owner or dog trainer whether the animal is thoroughly taught or not. Backing is the bringing out of the dormant instinct while the dog is still in his youth. Take the puppy out in the field along with the mother and let him see the parent "stand on a point;" the little fellow will back her, that is stand on his parent's point alongside of her, simply because of his strong imitative powers, instinct, and also that he smells game. At Balla for this mark of excellence in a dog they allow 10 points, if perfect. Pointing again is also a question of a pure strain of a long line of ancestral blood or inheritance, and it depends solely on the careful selection in the cross of the different breeds of setters.

Therefore if a dog has a good nose, if his pace and style of hunting be excellent, and his breaking perfection, we might then with propriety reduce the pace and style of hunting and pointing 5 points each, which would then make room

for retrieving. To instruct a setter to retrieve, either on land or water is the easiest of all lessons which the animal has to be taught. Having explained this system fully in previous issues of the *FOREST AND STREAM*, we wish only to say that in shooting snipe or woodcock in a thick swamp, where the birds drop dead one hundred yards from the shooter in the almost impenetrable swamp grass and bog, which is not of uncommon occurrence, it is of vital importance that the setter should be able to fetch the bird, without one's having to go to the expense of procuring and the trouble of unleashing a "retriever" to gather the birds, as is the custom in field trials abroad.

We could write on this matter more fully, as the question is an interesting and novel one to our sportsmen. Any information we may gather or that we are in possession of, we shall be pleased to give to our readers verbally or by mail. The pointer we will treat in a later issue. By examining the table of points as in use in the field trials at Balla, England, issued in our last number, the differences suggested by us may be better appreciated. Appended are the alterations in value of points we would advise:

VALUE OF POINTS WHEN PERFECT.

	30	20	20	15	10	5	100
ALTERATION IN MARKS OF EXCELLENCE FOR SETTERS.							
Name of Dog	Age	Pace and style of Hunting.	Breaking.	Pointing (Style and Steadiness in)	Backing.	Retrieving.	Drawing on Game or Rounding.
Forest.	30	15	20	10	10	5	100

We shall be glad to hear from correspondents on this matter.

We publish another letter from Mr. Price, of Wales, on the International Pointers and Setters Challenge. We feel sure that it will be read with much interest, as it settles all disputes, and answers in a very proper manner the letters of English gentlemen to *Bell's Life* and other sporting papers. We cannot interfere on this side of the water with any unpleasantness or discussions that may arise in field trials or any other sports in Great Britain, as we have quite enough to do to attend to our own.

RHWILAS, BALA, NORTH WALES.

EDITOR *FOREST AND STREAM*:—

I wrote to you some fortnight ago, stating that the choice of the English representatives, and the arrangement of details, would be, in case of the challenge being accepted, in the hands of the committee of the Kennel Club, our English Jockey Club, in shooting matters. I write to repeat that statement, seeing in *Bell's Life*, a letter from Mr. Llewellyn in which he challenges the right of Mr. Macdona and myself to call our dogs first class, and suggesting that his own are better. Mr. Macdona's "Ranger" and "Belle" won all their engagements last summer, and Mr. Whitehouse's "Pax" and Mr. Barclay Field's "Dick" also secured or divided all the stakes they ran for. I take it that these four dogs may be acknowledged to be the best in England at the present time; whether their owners will permit them to compete in the international match is another thing, and a question for the committee to decide. Mr. Llewellyn's "Countess," an undeniably first class animal, and one that has beaten "Belle" on the first occasion that they ever met, was beaten this year by both Mr. Macdona's "Ranger" and by "Belle." I write you this plain statement of facts, and beg to conclude with the assurance that should the challenge be accepted the best dogs will be selected by the Kennel Club for the match, or should they decline to interfere, which I do not anticipate, Mr. Macdona and myself will guarantee to find the dogs and the money for the contest. I am, dear sir, yours, truly,

R. I. LI. PRICE.

[We are in correspondence with the Kennel Club of England.—ED.]

—Our correspondent, S. C. Clarke, in acknowledging receipt of pointer Belle's photograph, writes, and we think very justly, as follows:

"I am bound to say that I have seen handsomer specimens of the pointer, and which showed higher breeding. I think she appears too long in the legs, and somewhat coarse in those limbs, as well as in the tail. I can see that she may be an animal of great powers of ranging and endurance, and I am aware that to appreciate the points of a dog as well as of a horse you should see him move.

S. C. C.

RETRIEVERS.—I thought I knew something about shooting and the dogs necessary for the sports, but the notice of the day's sport at Rhiwlas Bala—three guns, with sixteen dogs, "retrievers," 103 head—has completely upset all my ideas on the subject. For what on earth could three gentlemen take sixteen retrievers out with them. I have always thought one retriever enough for his own particular business? If they used them for other purposes than their legitimate business, surely other breeds are more useful.—*London Field*.

—Mr. R. D. Purcell Llewellyn's letter to *Bell's Life* in *London*, which is copied in the *New York Herald* of February 2d, is answered by Mr. Price's letter in our issue of last week. Mr. Price and the Rev. J. Cumming Macdonna leave the Anglo-American challenge entirely in the hands of the Kennel Club of England.

—Strange that game should be so dear when the efforts of every sportsman are directed to "bring it down!"

Shot Gun and Rifle.

GAME IN SEASON FOR FEBRUARY.

Hares, Squirrels and Wild Fowl.

FOR FLORIDA.

Red Deer, *Caracus Virginianus*) Wild Turkey, *Meleagris gallopavo*.)
Woodcock, *Philohela minor*.) Quail, *Ortyx Virginianus*.)
Snipe, Plover, Curlew, etc., in great variety.

[Under the head of "Game, and Fish in Season" we can only specify in general terms the several varieties, because the laws of States vary so much that were we to attempt to particularize we could do no less than publish those entire sections that relate to the kinds of game in question. This would require a great amount of our space. In designating game we are guided by the laws of nature, upon which all legislation is founded, and our readers would do well to provide themselves with the laws of their respective States for constant reference. Otherwise, our attempts to assist them will only create confusion.]

—A correspondent in Hillsboro, Ohio, who is a veteran sportsman, sends the following extraordinary instance of "buck ague." Cases like this occur even with old hunters, but they merely indicate a peculiar exceptional nervous state of the system, which cannot be accounted for except on general principles. Some of our nervous friends may find sympathy or encouragement therein. The phenomenon is not more singular than that nervous condition which starts at the slam of a door or the snap of a twig while it remains unshaken by the peal of the thunder-clap or the rattle of musketry:—

EDITOR FOREST AND STREAM:—

Some thirty years ago the writer started out by daylight, "solitary and alone," for a deer hunt. He had made a horseback trip to Portsmouth, on the Ohio River, fifty miles from his home, to attend court, and on his way down left his rifle at a settler's cabin in the Sunfish Hills, then a very wild section, abounding in deer, intending to stop a day or two on his return.

It was December, and a ten inch snow had fallen during the night, and ground, bush, and bough were covered with the soft feathery crystals. The hunter had resorted to a common trick to beguile the game by putting on over his clothes a large white shirt, borrowed from the settler, and tying a linen handkerchief over his cap. Thus accoutred, like the ghost in Hamlet, he moved slowly, noiselessly, and almost invisibly along, often stopping to get sight of the quarry and steal unnoticed upon him. On turning a thicket a deer was discovered browsing in a fallen tree top not thirty yards off. He had not seen or heard or smelt the hunter, and kept munching away at his breakfast. There seemed a certainty of fine, fat venison; barring accidents, but no time was to be lost. The rifle was brought quickly to an aim, and the hunter pulled and pulled, harder and harder, but there was no report. It was a hair trigger, and *should* have gone at the weight of a grain. When taken down to examine, it was found that in the haste and excitement it had only been half cocked. This was soon corrected, but when the gun was again brought to the shoulder a film seemed creeping over the eyes, the atmosphere was filled with a gray mist, the outlines of the deer disappeared, and an anguish tremor ran through every bone and muscle.

This time the gun went off, and so did the deer, but it is very doubtful if even the tree top was hit, or whether if the object had been a Dutch barn it would not have been missed. The fog and the film, however, cleared away in season for the hunter to see the deer making 2:40 time over the hill, evidently unhurt. Thereupon the sportsman sat down upon a log and silently went through an argument whether it were better to throw away the gun and go home, or go ahead and perhaps be fooled again. But courage came with reflection, the rifle was reloaded, and the hunt renewed, and before noon a fine doe was hung up to a sapling. It was a clear and violent case of *buck ague*. Has the reader ever had like experience?

VETERAN.

—Our Minnesota correspondent relates an experience in still hunting which has been alluded to in these columns more than once, proving that it is often wiser for the hunter to remain quiet after the deer has got the wind of him than to persist in industrious stalking:—

BRainerd, MINN., December, 1873.

EDITOR FOREST AND STREAM:—

The sketch of my friend "Bedford," in number 19 of your paper, and your accompanying foot notes, prompt the following:—One day after a fresh fall of snow, we started to look after deer a mile east of town. While following a winding wood road, we got a glimpse of a buck about twenty rods away, head and tail down, sneaking away like a fox through the underbrush. We sent a ball after him, but the brush was too thick, and with a bound he was off like a rocket. Sticking another cartridge into the rifle, and taking a look at the compass, we were off, too, on the trail, quietly and cautiously taking note of everything. The lay of the ground, and the direction he was taking, told us he was making for a tamarack swamp a mile or so away. Knowing the ground thoroughly, we took a short cut, going pretty fast, and struck the swamp—a nearly circular patch of tamarack poles, tall grasses, and dead trees—bad ground for the hunter, but just the place for an old wily skulker like the five pronger we were after. We soon found his trail, where he had walked into the swamp, and noticed where, as he leisurely moved along, he had stopped to paw or nibble a sprig from a birch, as much as to say, "I've got into my stronghold now, and may as well take it easy; this moccasined hunter who scared me so cannot find me here." We followed him through the swamp, doing our finest work, and at the outer edge saw from his leap that he had discovered our presence, but trusting to his cover and sagacity he had disdained to take the timber and his heels for it, but began to circle the swamp, now under cover, then outside among the grass and rushes, now running and then walking. In one place he had walked towards us a few yards, then with a leap toward the right he had turned and gone on. Patiently, noiselessly, and ardently, as becomes the still hunter, we followed the devious windings of the trail till he had twice crossed the track we had made on entering the swamp. We were peering cautiously ahead, hoping earnestly for one more shot before dark, when a thought struck us, and wheeling about suddenly we found that we were being trailed instead of doing the trailing! For behind us, coming quietly and confidently along was the buck we supposed we were in pursuit of! We pitched the rifle up, but with a flint of his body he "reversed motion" so quickly that we had no time to shoot.

For a few seconds we were nonplussed, but there was one more chance to take, and that was to race across the swamp, get in ahead of the deer, and trust a hunter's luck for the rest. So we took it, and plunged into the brush, jumping logs, dodging the spring holes, and struck the trail before the deer came along. Hastily getting behind a big tree we waited for him, and not in vain, for in about ten minutes (long enough to allow us to get our nerves in shooting condition after the brisk run) we saw his antlered head bobbing over the rushes as he came steadily along. Slowly raising our rifles and taking dead aim, we waited—waited coolly, for we knew he was our game. On he came slowly till within twenty rods, when, with a terrific leap, he bounded into the swamp and stood still for one instant, then mounted an old dead tree and commenced slowly pacing along it. When he reached the end he threw up his head, as if alarmed, and as he gathered himself for a jump the rifle cracked not a moment too soon, and the lordly buck, which had led us such a chase and fooled us so badly went "spread eagle" fashion into the snow. Yours truly,

HAVILAND.

—The merited promotion of Colonel Wingate, new In-

spector-General on the staff of General J. B. Woodward, of the Second Division, is to be looked upon as fortunate for the interests of the rifle movement in the State. We may feel sure that Colonel Wingate, the former most energetic Secretary of the National Rifle Association, will instil into the men of his division, a proper idea of the advantages of rifle practice, and under his excellent method of instruction, undoubtedly many a soldier in the gallant second will compete successfully with other divisions at Creedmoor in future rifle contests.

A FEW HINTS TO SPORTSMEN.

BALTIMORE, January 29, 1874.

EDITOR FOREST AND STREAM:—

I am glad to see that sportsmen are awaking to the idea that birds, fish and animals should be called by their right names. I think it would be a good plan to introduce into schools a hand-book of Natural History, and teach the growing ones at least what is correct. Here they call the quail a partridge (for this there is an excuse, as they quote Audubon; which is right?) they call a ruffed grouse a pheasant; the ruddy duck a coot and water partridge; the coot proper, a crow bill; the rail an ortolan; rabbits for hares, of course; Wilson's snipe a jack snipe; the weakfish sea trout; bluefish taylors; and speak of catching salmon in the Ohio river.

I ventured to remonstrate the other day about calling the ruddy duck a coot, and was told that men who had lived for twenty years on the shore called them coot, "and did I pretend to know more than they did?" Again I happened to say that it was a shame to kill robins (migratory thrush), and was told it was good sport, and besides, the robins ought to be killed, for they ate up the wheat. Whew! What do you think of that? It put me in mind of the old story of the farmer who kept missing his sheep, and at last found a fellow in the road that run by his place, cutting the throat of one of his sheep. He asked him what he meant, and he said that he would give him to understand that no man's sheep should come out and bite him. I expect to hear them say yet that the bluebirds carry off their chickens.

It is of no use to talk to them; they either think you are putting on airs, or look upon you with pity, and wonder how you can be so ignorant.

They stick to long barrels to their guns here, and small loads of powder with large loads of shot of large size. For instance, many of their guns of 10 or 8 bore, are 36 or 40 inches in the barrels, and they tell you the proper load for these is from 2½ to 3 dr. of powder, 2 to 2½ oz. of shot, size from No. 1 to B. B. We think that 32 in. 8 bore, or 30 in. 10 bore about right, and the load 5 or 4½ dr. powder to 1½ to 1½ oz. of No. 4 shot for ducks (No. 6 early in the season), No. 1 for geese. Which do you think is right? Speaking of guns, they have a gun maker here that makes, to my notion, the best central fire breech-loader I have ever seen. For simplicity, strength and correct proportions I have never seen its equal, and I have seen many good ones. As he does not advertise in FOREST AND STREAM, I shall mention no names; but when he does may say more about his guns.

I am glad to see that there is a chance for a field trial between English and American dogs, and I trust that it may come off and that I may be there to see it. I agree with you about Western dogs. I have seen many a rough looking one out there that was a paragon, and I think they are better handled, less yelling and beating than in the East. Often I have seen the silky coated English or Eastern dogs put to shame by one that was hard to look on, at which the owners of the former had turned up their noses.

WANDERER.

—The Brooklyn party shot a match at Dexter's last week. Dr. Aten and Mr. Hickock were matched against Messrs. Baylis and Birdseye. The match was shot under the English rules, that is, use of both barrels, and from five traps, 30 yards rise, 80 yards boundary, 1½ oz. shot. The birds were poor. Mr. Baylis killed 10 out of 15; Mr. Birdseye killed 6, making 16 out of 30; Dr. Aten killed 10, and Mr. Hickock 9, making 19 out of 30, the latter winning by 3 birds. Capt. Elmendorf was the referee.

—The cold weather of last Friday did not prevent a goodly gathering of pigeon shooters at Deerfoot Park; the birds, as supplied by McMahon, were strong on the wing, and mostly driving birds. The shooting began with a sweepstakes of five birds each, \$5 entrance, Long Island rules to govern, 21 yards rise, 80 yards boundary, and 1½ oz. shot. There were five entries, which resulted in a tie between Messrs. Townsend, Bohring and Ireland, when, it being shot off, the \$25 was divided by Messrs. Ireland and Bohring.

Charles Townsend—1, 0, 1, 1, 1—Killed, 4.
"Dr." Ireland—1, 1, 1, 1, 1, 0—Killed, 4.
Mr. Bohring—1, 1, 0, 1, 1—Killed, 4.
Moses Chichester—1, 1, 0, 0—Killed, 3.
Thomas Broadway—0, 1, 0, 1, 1—Killed, 3.
The second sweepstakes of five birds, \$5 entrance; same rules and conditions.

"Dr." Ireland—1, 1, 1, 1—Killed, 5.
Charles Townsend—1, 1, 1, 1, 0—Killed, 4.
Thomas Broadway—0, 1, 0, 1, 0—Killed, 2.
Mr. Van Dyke—1, 0, 0, 1—Killed, 2.
W. McFall—0, 1, 0, 0—Killed, 1.
Mr. Bohring—1, 0, 0—Killed, 1.
"Dr." Ireland took first money and Charles Townsend second.

Sweepstakes, five birds each, \$5 entrance; same rules and conditions.

Moses Chichester—1, 1, 1, 1, 1—Killed, 5.
Charles Townsend—1, 1, 1, 1, 0—Killed, 4.
Thomas Broadway—1, 0, 0, 1—Killed, 2.
Mr. Gildersleeve—0, 1, 0, 1—Killed, 2.
Mr. Van Dyke—1, 0, 0—Killed, 1.
"Dr." Ireland—0, 1, 0—Killed, 1.
Referee in all the sweeps, Mr. Wingate.

—A pigeon match took place at Dexter's Club Grounds, on the 29th, between four gentlemen amateurs of Brooklyn, 15 birds each, 30 yards rise, 80 yards boundaay, from five traps. English rules to govern.

An. killed 10, missed 5.
L. C. killed 9, missed 6.
By. killed 10, missed 5.
Bs. killed 6, missed 9.

[We cannot publish any more initial letters, as if a match is worth printing at all, the full name or pigeon shooting name must be given. Ed.]

—The covert shooting on the estate of Mr. R. J. Lloyd Price, (the owner of "Belle") at Rhiwlas, Bala, North Wales, has been excellent. Mr. Price, accompanied by two gentlemen, killed on New Year's Day, using sixteen dogs, (retrievers,) cock pheasants, 53; hen pheasant, 1; partridge, 1; rabbits, 34; woodcocks, 13; snipe, 1; total—103.

SCRANTON, LUZERNE CO., PENN., January 30, 1874.

EDITOR FOREST AND STREAM:—

A pigeon match was shot at Wilkesbarre, Luzerne county, Penn., on the 22d instant between Mr. Cox, of Schuylkill county, and Mr. Maddox, of this place, for the championship of the two counties and \$1,000 a side. Mr. Cox won the match by shooting 25 birds out of 36, Mr. Maddox killing but 19.

A sweepstake pigeon match was shot at Scranton, Penn., on January 29th between Alfred Evans and John Hughes for \$100 a side. The following is the result:—

Evans.....1, 1, 1, 1, 1, 1, 1, 0, 1, 1, 1—11
Hughes.....1, 1, 0, 1, 0, 1, 0, 1, 1, 0, 0—7

G. A. DICKSON.

WASHINGTON, D. C., January 26, 1874.

EDITOR FOREST AND STREAM:—

I send to your address by to-day's mail the score of a pigeon match between William Harris, of Alexandria, Va., and John Ferguson of Washington, at Riley's Coral on Saturday, January 24, at 25 birds, 21 yards rise, 80 yards bound, for \$25. Harris gave up the match at the thirteenth bird; also the score of a match between Ferguson and Williams, same day and place, at 10 birds, same rules as above, for \$10. Each man handled and trapped for the other. Referee, A. Wardell; judges, Derrick and Smithson. Very respectfully and truly yours,

JAS. N. DAVIS, JR.

Ferguson.....1 1 1 1 0 1 1 1 1 1 1—12
Harris.....0 0 1 1 0 0 1 0 0 0 0 1—4
Williams.....1 1 1 1 0 0 1 0 1 0 1—7
Ferguson.....1 1 1 1 1 1 0 1 1 1 1—9

RIFLE PRACTICE.

The following are the highest scores at Conlin's Gallery, up to February 3d.

For the first prize seven consecutive bullets.
For the second prize five consecutive bullets.
For the third prize four consecutive bullets.
For the fourth prize twelve in twenty shots.
For the fifth prize eleven in fifteen shots.

Sea and River Fishing.

FISH IN SEASON IN FEBRUARY.

Pompano.	SOUTHERN WATERS.	Sheepshead.
Snapper.	Trout, (Black Bass.)	Tailorfish.
Grouper.	Drum, (two species.)	Sea Bass.
Rockfish.	Kingfish.	
	Striped Bass, Rockfish.	

THE MASSACHUSETTS ANGLERS' ASSOCIATION held an important meeting on the 28th of January, in Boston, Dr. J. P. Ordway, the President, in the chair. Twenty-eight new members were elected. Dr. A. L. Squires, now of Newport, accepted the office of Corresponding Secretary. The committee on trout submitted a report in which they stated that they have made a careful examination of the laws relating to trout fishing, and have also visited many places where trout were exposed for sale. We copy the report almost entire:

That the laws of Maine are daily violated, and to a great extent is apparent. Hardly a day that there are not exposed in the stalls of Quincy Market light-meated, dark-sided trout, whose spots and general appearance tell too plainly that the waters of the Kennebec and Cupsuptic were once lashed by their tails. Most of such Maine trout brought here for a winter market are in the worst possible condition—very soft and often so long out of water that they are utterly unfit for the table. And yet there is a demand for them.

Brook trout, also, from Vermont and Maine, are offered in the market in large quantities—poor, little, weak, puny things, not to be compared to the speckled beauties of next May. A blind man, with a copper-fastened stomach, and no reputation, might possibly be induced to admit that he had purchased and swallowed half a dozen such trout, but that a person in his right mind, with eyes, and knowing anything of the laws of health and digestion, could be found to admit as much is beyond the comprehension of this committee. Nature stamps their corruption with plain marks, and their sickly, unhealthy appearance outside and in would warn anybody except the keeper of a boarding house. But how are we to prevent these sales? Your committee find that the sum of all the periods in the different States during which trout are forbidden to be taken or sold amounts to nearly the whole year. The spawning season varies very much in the time of its commencement and ending, varying even in the same State in different localities.

There would then be an evident injustice in passing a law to prevent the exposure for sale in Boston of all trout caught outside the Commonwealth within the limits of time which, in this State, it is illegal to take them, as such trout may have been caught at a time when, where caught, it was perfectly legal to catch them, and may be in a perfectly good condition.

It may be possible to provide by statute that it shall be illegal to sell or have in one's possession in this State trout caught in another State contrary to the laws of such State or within the prohibited periods; and your Committee endeavor herewith to lay before you a bill for this purpose. There are also in this State laws relating to the inspection of food, from which the Committee hope to gain some aid for the objects of this Association. We can actively influence the appointment of inspectors—men open to conviction on the subject—and we can see that they are fully informed as to the quality of the trout coming into this market within the prohibited times. Under the provisions of 1872, chapter 231, such inspectors have the power to inspect all fish offered for sale, and when they find any that are unwholesome, from any cause, they may seize the same and have them destroyed. Another provision of the same statute is to the effect that whoever knowingly offers for sale unwholesome fish is to be punished by imprisonment in jail not exceeding sixty days, or by fine not exceeding \$100.

Your committee think that it will be in the power of the Association, availing themselves of this statute by proper publications, to greatly discourage the sale of trout illegally caught.

The association can do much more in another direction. It is painful to have to admit, as we must, that reputed sportsmen often leave word with the farmers and guides who live near the ponds and brooks that furnished them their summer sport, that they would like a few large ones during the winter. The bribe is greedily taken, and the bores, only too familiar with the spawning grounds, and eager to please their summer boarder, think nothing of killing the great mother trout with their millions of eggs, and so depopulating the streams. This Association can make it very uncomfortable for such pseudo sportsmen. And it will be easy to start a similar association in every State in New England. Each member to become a live detective and report to the brotherhood of sportsmen all violators of the law. A few published notices of such characters would diminish their numbers. Such associations, corresponding with one another, would soon make their influence felt, and in high places.

One of your committee reports through us an experience which shows the necessity of such influence, an experience which shows that *wicked violations* of the law in sister States have been duly and carefully brought to the notice of persons in authority, and whose official position enabled them to do something about it, and no proper notice was taken of it by them. Persons guilty of spearing, grappling and netting trout in the spawning season, contrary to the State law, were excused on the ground of personal friendship. No trial justice, nor fish commissioner, nor inspector of provisions, would dare be guilty of such conduct in this State now, when he knows that an association of such numbers and influence as ours would have his name reported to them, and his conduct discussed, and an effort immediately made and persistently kept up to have him dismissed from his office.

To sum up then, your committee are of opinion that the Association can do something for the protection of trout in the following ways:

1st. By influencing public opinion, procuring similar associations to be formed in other sister States, and co-operating with them for the purpose.

2d. By calling the attention of the community to the existing provisions of the fish law and of the laws for the inspection of fish as food, and doing all we can to secure their enforcement in this State, and for this purpose offering rewards for detection and conviction of offenders.

3d. By specially teaching that the killing or taking of trout on their spawning beds by any process is not merely stealing but worse, as it destroys the source of property.

4th. By procuring the enactment of a law which shall make it unlawful to expose for sale in our Massachusetts markets fish illegally taken in other States within the periods for which their taking is prohibited in such States. Respectfully,

SIMON W. HATHEWAY,
SOLOMON HOVEY, JR., } Committee.
J. H. C. CAMPBELL,

The draft of a bill for the protection of trout accompanied this report, of a very stringent nature, which will be presented by the Association through their committee to the Legislative Committee on Fisheries.

The President in this connection read several letters from Mr. J. H. Kimball, one of the Maine Fish Commissioners, endorsing the work of the society, and favoring the passage of similar laws in all of the New England States, relating to the catching and sale of trout.

TABULAR STATEMENT of the Catch of Salmon by Messrs. John W. Nicholson and R. C. Boxall, during portions of the months of July and August, 1873, on the Nepisiquit River, New Brunswick, leased by John W. Nicholson of St. Johns, N. B., from the Dominion of Canada, for the purpose of Angling for Salmon with the Fly.

ST. JOHN, NEW BRUNSWICK, 7th January, 1874

—Dr. Fowler, of Syracuse, has placed anglers under obligations by giving them a newly invented reel, made of hard rubber, which for the simple quality of lightness makes it a great desideratum. It has been difficult to combine this requisite with the strength necessary to support the sometimes complicated machinery of the reel, and all anglers who use the finest tackle will appreciate Fowler's improvement. There are other new features in his patent which are worthy of attention. Andrew Clerk, of Maiden Lane, is the sole agent for their sale. See advertisement elsewhere.

—Our correspondent "Fern Fly" shows how trout can be caught that will not cost "a dollar per pound"—this being the estimated average when travelling expenses and outfit are taken into account. He writes:

"We planned a pedestrian trip from Rondout to Callicoon on the Delaware river, a distance of about one hundred miles. Accordingly we left New York one evening by boat for Rondout, and the following morning we went up the Rondout and Oswego Railroad to Big Injun Station, and from there began our tramp up the Big Injun Creek to its head; then over the mountain to the west branch of the Neversink, down this stream to its junction with the east branch at the little tannery village of Dewittsville, and from there twelve miles through the woods to Balsam Lake and the headwaters of the far-famed Beaverkill. Then down the latter to Westfield Flats, where we took stage for Callicoon, and from here a few hours' ride on the Erie Railway brought us back to New York, after an absence of two weeks, ten times stronger and dirtier than when we left it. The expenses of such a trip will not cost anywhere near the proverbial dollar a pound.

Two are enough to make such a trip as this. It will be necessary for the sportsman to carry blankets, woolen and rubber, cooking utensils, and other appliances for camping, but pork, bread, butter, &c., can be obtained at the log cabins which are scattered all through this region, and if the party are accustomed to camp life they can find an abundance of real solid enjoyment. The Coachman, Beaverkill, Brown Hen, Alder and Grizzly king are some of the best flies for this country.

FERN FLY.

These pedestrian excursions are often most enjoyable, and are frequently undertaken by students of New England colleges with pleasure and profit.

208 WEST LOGAN SQUARE,
Philadelphia, Feb. 2, 1874.

EDITOR FOREST AND STREAM:—

The private letter which states that I am "presently to start a large fishing tackle and rod factory at Philadelphia," does so in error. I have for some years been making fine fly rods and tackle and furnishing such outfits, but the rods, from but to top, including ferules, also trout and salmon flies, are all of my handiwork. Consequently the production of my workshop is not very large, although I am kept constantly busy. I do make fine bait and trolling rods when ordered, but my work is almost exclusively fine fly-fishing tackle.

BROOKLYN YACHT CLUB.—The annual meeting of this well-known Club was held in their rooms, in Court Street, Brooklyn, on the evening of the 28th of January; heretofore this meeting has taken place during the month of April, but, considering that month too near the opening of the season, in order to give them more time, they changed it to the above date.

The business before the meeting was the discussion of matters of interest to the Club and the annual election of officers. The business "behind the meeting," (as the Dutchman said,) was the discussion of a most brilliant champagne "feed," in honor of the birthday of the Club, and, as yachts are always called "her" and "she," being gallantly inclined, we won't give the age, (fact is, we don't know it.) Of the supper more anon.

As showing the unanimity and good fellowship existing in the Club, *most all* of the officers of the past year were unanimously re-elected, with the exceptions of "Happy," John Oakley as Judge Advocate, in place of Henry A. Mott, Esq., whom Stuart of Winter Garden fame used to call "Bon. Mott," and J. A. Brawn, Esq., in place of J. Varnum Mott, M. D., on the Regatta Committee.

The members then, whose appetites had been growing from the "sound of preparations" and the smell of "sundry hot things" from an adjoining room, shaped their course for that room and soon fell too, as yachtsmen only can.

After doing ample justice to the Steward's "fixtures," the "feast of reason" commenced; the following are some of the toasts and responses, not in order, it may be, as this is from memory alone:—

"Our past;" responded to by Mr. G. L. Haight, of the Genia. Add an "I" to the name of his yacht, and you have the man, and the same may be said of the speech.

"The New York Yacht Club, the parent organization;" responded to by Chris. Gunther, Esq.

"Sister Clubs;" responded to by the ex-mayor of Detroit, Mr. Smith.

"Woman;" by John Oakley.

"Our future;" by Dr. Hall.

"The navigators of the Sound;" responded to in a sound manner by Rear-Commodore Dillon, whose yacht, like all "Kates," is pretty and graceful.

"Our officers and ex-officers;" by ex-Commodore J. S. Dickerson, of the Fleur-de-Lis.

After some charming singing, they rose from the table at eight bells sharp, all satisfied with themselves, the Brooklyn Yacht Club, and everything and everybody.

Among other well-known yachtsmen the following were present:—Commodore Voorhis, Captain; "Joe" Ellsworth, P. McGiehan, John Sawyer, of the "Mystic;" Commodore Langley, Captain Waterman, of the "Quickstep;" J. T. Pierson, of the fast beauty, "Jeannette," carrying the pennant of the Bayonne Yacht Club, and many others.

The Club contemplate moving from their present quarters to the new building at the corner of Montague and Court Streets, and by another birthday, hope to spread themselves in more roomy and elegant shape.

The Measurer, Mr. J. M. Sawyer, reports that there were

seventeen schooners, forty-four sloops, and five steamers enrolled on the books, and that there were several more building, which would be added to the fleet in the spring.

The following are the list of officers for the year 1874:—

Commodore—Jacob Voorhis, Jr.
Vice-Commodore—John S. Dickerson.
Rear Commodore—Robert Dillon.
President—P. W. Ostrander.
Secretary—W. T. Lee.
Treasurer—Chauncey M. Felt.
Assistant Secretary—George G. Dunning.
Measurer—John M. Sawyer.
Fleet Surgeon—Samuel Hall, M.D.
Judge Advocate—John Oakley.
Trustees—G. L. Haight, J. J. Treadwell, J. H. Dimon, H. S. Wood, Rufus Hatch, W. B. Nicholls, John T. Barnard.
Committee on Membership—Charles L. Franklin, W. M. Ringwood, Thomas Fry, M. D.
Regatta Committee—H. Baragwanath, J. A. Breman, Ernst Wendt, M. T. Davidson, Dr. Samuel Hall.

—Mr. A. E. Smith, proprietor of the marine railways at Islip, has on the stocks a first-rate yacht of forty-five feet keel for parties in Albany; a twenty-five feet keel cat-boat for Mr. Van Vorst, of New York, to be finished in hard wood; a twenty-two feet keel cat-boat for parties in Islip, and has contracted to build a schooner-yacht of eighty-two feet keel, twenty-two feet beam, and five and a half feet hold, for Wm. H. Langley, of Brooklyn, to be finished in time for the usual June regattas.

—The following is a list of the officers of the Bunker Hill Yacht Club, of Charlestown, Mass., for the ensuing year:—J. H. Pitman, Commodore; A. A. Lawrence, Vice-Commodore; P. Lobdeli, Fleet Captain; Warren Ferrin, Secretary; George Melvin, Treasurer; P. J. Henchy, Financial Secretary; William R. Cooper, C. H. Hatch, E. Cutter, Trustees; R. B. Brown, J. G. Lovell, Measurers; W. McLaughlin, Steward. Ex-Commodore Daniel R. Beckford, of this club, has purchased a fine residence in Marblehead, and will soon move thither. He has negotiated for a new schooner yacht, which will be thirty feet long and about twenty-five tons burden.

—At the annual meeting of the Madison, Wisconsin, Yacht Club, the following officers were elected for the ensuing year:—Commodore, Myron T. Bailey; Vice Commodore, S. C. Cabanne; Recording Secretary, N. P. Jones; Corresponding Secretary, Charles G. Mayers; Treasurer, George A. Patterson; Measurer, John Gallagher; Collector, Charles K. Kenney; Steward, John W. Rudd. Regatta Committee, C. G. Mayers, George S. Case and William G. Pitman. The Club is in a flourishing condition.

—The "Yacht Mercury" of the South Boston Yacht Club will carry the Commodores' Flag the coming season, she having lately been purchased by Commodore J. N. Roberts, who will put her in first-rate order, and make her worthy of the prominent position she will occupy in the fleet.

Boston, January 29, 1874.

EDITOR FOREST AND STREAM:—

I see in the last number a question by J. E. W., regarding the whereabouts of the yacht Julia, mentioned by "E. M.," which he says he saw in Narragansett Bay in 1871.

I think there must be some mistake about the date, as the Julia mentioned by E. M. was at that time in Eastern waters. She was built by Mr. Waterbury, is 77 feet in length and 20 in breadth; she was sold into Eastern waters in 1861 or 1862, and there changed to a centre-board schooner. Afterwards she was sold to New York, and from there to a gentleman living on Narragansett Bay, who changed her to a keel schooner. She remained there till the fall of 1870 or the early spring of 1871, when she was sold to a member of the Eastern Yacht Club. At any rate she arrived in time to participate in the annual regatta of the E. Y. C. held at Marblehead July 14th, 1871, and I feel sure did not go round the cape afterwards. In 1871 and '72 she sailed in several regattas of the E. Y. C., being re-changed to a centre-board in the spring of 1872. Last season she flew the Vice Commodore's flag, and led the fleet on the annual cruise to Mt. Desert; she also sailed in the regattas of the club, barely missing the prize on the 23th of June. I would refer you to the N. Y. Y. C. books of 1863 and 1870 and the E. Y. C. books of 1871, '72, and '73. "E. M." also speaks of other yachts of which I can give him some information. The America is no longer owned by Uncle Sam, as E. M. would have seen if he had read the FOREST AND STREAM for November 13. She was purchased last August by a Boston gentleman and sailed over the course in the E. Y. C. regatta of the 4th of September, where she was badly beaten by the Halcyon; the Silvie also beat her one minute by allowance. It is, however, only fair to state that it was blowing very hard and puffy, and that her rigging was in a fearful condition, as she lost her boat, sprung her jibboom and main-topmast, &c.; but on the other hand, the Halcyon lost her flying-jib and the Silvie her jib-boom.

The Rebecca also was mentioned by E. M. She was changed to a schooner and has been for several years in Eastern waters, being flagship of the E. Y. C. for three years. She is now owned by a member of the club.

The Narragansett also belonged to the E. Y. C., and is now owned at Boston.

The Una is now a pleasure boat at the Boston wharves, while the Haswell raced the Sadie of the E. Y. C. in 1871. Yours truly,

BLUE WITH A GOLD CASTLE.

—That was a good example which Mr. Thomas Brassey, M. P., for the venerable borough of Hastings, England, lately set our venerable yachtsmen. Not content with mere amateur proficiency in nautical knowledge, Mr. Brassey, has passed the Hastings Marine Board, and obtained his certificate of proficiency as a master in the mercantile marine. Mr. Brassey has the honor of being the first amateur sailor who has obtained such certificate, which is only granted upon the candidate displaying a thorough knowledge of practical navigation.

—Capt. Dana, of the Harvard crew, and a delegate to the recent convention of rowing associations, has sent a letter to Mayor Waller, of New London, Conn., in which he asserts that Harvard boatmen are strongly opposed to the proposed College regatta at Saratoga, and intimates that another convention will probably be soon called. He thinks New London would be a suitable place for the regatta, provided certain conditions can be complied with by the authorities of that city.

—With regard to the withdrawal of Amherst College from the Saratoga regatta, the Amherst *Student* of January 31st says:—

"It is a great source of regret amongst us that we feel obliged to take the step we have taken. If the Convention had selected New London or any other respectable place we would most gladly have entered. Indeed, we may say that if the evil results which we anticipate at Saratoga do not follow, and it proves to be all that it is claimed to be, we shall be willing to row there, if ever another regatta should be held there. But until this has been demonstrated by actual experiment we prefer to stand aloof.

"We still favor the idea of 'A New England Association,' and we firmly believe there is no safer way to preserve 'The College Regatta' from the corrupting and contaminating influences to which it is now recklessly exposed than to form an association of our own New England colleges, select the best water in New England, and harmoniously and independently enjoy amongst ourselves the pleasures and the triumphs of the inter-collegiate contest."

At a mass meeting of the Amherst Boating Association, to take into consideration the action of the Hartford delegates, it was argued that "we have nothing to fear from not being represented in the coming regatta, as the rivalry between the different classes was sufficient to keep boating alive and the men in good training." The following resolutions were adopted without a dissenting voice:—

WHEREAS, By vote of the Rowing Association of Colleges Saratoga has secured the coming regatta; and

WHEREAS, In the popular judgment Saratoga and its amusements are controlled by professional gentlemen, whose superintendence and assistance would be deemed contaminating; and

WHEREAS, The College Regatta has owed its past popularity and usefulness to its honest spirit of emulation and its independence of such outside manipulations as are supposed to reign supreme at Saratoga.

Resolved, That Amherst is opposed to a College Regatta at Saratoga as hostile to the welfare of the Rowing Association of colleges in general and Amherst in particular.

Resolved, That Amherst will not row in Saratoga waters.

Resolved, That the officers of this College Boat Club be directed to arrange for a class regatta at Hatfield commencement week.

After the business of the meeting was transacted, Dr. Edward Hitchcock said that he was glad that the students had taken this manly stand, and he was sure that they would meet with the full sympathy and support of the Alumni.

ORANGE, N. J., January 26, 1874.

EDITOR FOREST AND STREAM:—

The decision of the college oarsmen to row in July next on Saratoga Lake, it seems to me, is likely to prove a source of regret to those who, like yourself, are anxious to promote the best interests of athletic sports, and especially of rowing, among American gentlemen. I desire to call attention to some points wherein their action seems premature, ill-advised, and likely to prove prejudicial.

To begin with, the disregard of their own rules is ominous. According to the constitution, all applications for admission to the Rowing Association, all constitutional amendments, the question of when and where the regatta shall be rowed, could not be finally acted upon until the annual convention on the 25th of next March. The interval from then till July would afford ample time for the most elaborate regatta arrangements. The precipitation in forcing a decision, the evident aversion of the Saratoga claimants to a deliberate and full discussion by the college and public press of the different places proposed, and the report that, notwithstanding the association reiterated last week its vote of last spring, not to allow the employment of professional trainers, a crew well to the front in the last race has already engaged a professional, all seem to indicate that the constitution is hardly worth the printing. The representations of the Saratogians are most attractive, their promises truly profuse, and their offers are generous and seemingly disinterested. But even admitting their claim that the Saratoga course, *per se*, is the "best in the world," it is by no means certain that it is the *best* place, in New York even, for the young men of our best and oldest colleges to row their friendly races on. The character, reputation, and associations of the place must be considered. Saratoga bears the reputation, and thrives under it, of being the "summer capital of the fancy;" it is the stronghold of gamblers and betting men. The landlords and the real estate brokers, and therefore Morrissey, longed for the college regatta as a new sensation. They have got their desire. The Rowing Association is willing "to defy public opinion," if need be, to please itself and Saratoga. "In order to satisfy public opinion," if possible, it will accept no prizes nor favors from Saratoga, and from such as may be included under the term "hospitalities." The next regatta surely bids fair to be most brilliant. Doubtless it will be witnessed by a greater concourse of spectators than ever before. I believe that Saratoga is so far away from the principal colleges, and the expense of getting there and staying there so great, that very many collegians will be prevented from witnessing the races. But the gamblers and blacklegs will flock to the regatta.

The boating element in our colleges can ill afford to please and conciliate sports and the riff raff, for by so doing it will inevitably alienate the better class of undergraduates and the alumni. The disapproval and hostility of the professors and the "governors" will follow. If the oarsmen can command neither the sinews of war from their fathers and classmates, nor the moral support of their teachers and friends, they may as well give up the battle. In view of the fact that there is still a large and influential class in the community of those who are skeptical, to say the least, as to the benefits of boat racing; that there is a decided feeling against Saratoga as a gathering place for young men; that the Amherst College boat club has unanimously voted not to send any crew to row at Saratoga, and that other clubs are greatly dissatisfied with the decision of the Convention, I can but feel that, with the Hudson and the Connecticut rivers at their disposal, the Association made a serious if not fatal mistake in voting to row on Saratoga Lake.

H.

COLUMBIA COLLEGE, January 26, 1874.

EDITOR FOREST AND STREAM:—

The Convention is a thing of the past. The next College Regatta is to be rowed at Saratoga Lake, on July 16th, and Amherst has withdrawn, while Harvard and Bowdoin are said to be contemplating the same step. But, if they are not willing to row a fair race on an honest course, let them go. There will be enough without them to make the regatta of '74 the greatest event in the history of American colleges. I wonder what objections these irritable gentlemen have to Saratoga. No one denies its advantages in the matters of a fair course, good accommodations, and comparative easiness of access. In every particular it is superior to Springfield, which, in the opinion of students, is merely a synonym for extortion and fraud. "But what of John Morrissey and Gin Mills?" says some pious deacon. I don't intend to defend Morrissey but he will not hurt you if you leave him alone. And concerning Gin Mills, all I care to say is, that the Saratoga bars will not sell more than was sold in Springfield, and it will be better liquor and cheaper at that. Last summer there was a bar not one hundred yards from the Massasoit House, that was crowded day and night, and sold its villainous mixtures without even a pretence of secrecy, and no attempt was made to close it.

The action of the Convention in refusing the liberal offers of the Saratoga Club has effectually silenced the slanders that they were to be bought by generous offers of prizes and financial assistance; and to all such proposals we say that we go to Saratoga to row a race for the championship of American colleges, and care for no other prize if we cannot win that, and we intend to send a crew that will make the winners work if they come in ahead of us. B. F. Rees, stroke of our crew last year, is captain and stroke this year, and we can find a crew that is worthy to row behind him, which is saying enough; so if you go to Saratoga next July, as I have no doubt you will, look out for the "dashing white and blue" among the first.

Our New England friends were on the right track when they proposed to make some limit to the membership of the association, but their proposal was slightly too selfish. What we need is to confine this contest to the real universities of the country, and not leave it open to every high school or mushroom college, and we must decide upon some standard by which to measure each applicant. A great university cannot be created in a moment by any one man. The nearest approach to this is Cornell, but then Cornell is *sui generis*, and we are not likely to see another such for some time, and we may almost say that it requires at least a century to clothe a college with that garment of tradition and learning which is the great essential of a true university. But to descend from the abstract. We are having dull times at Columbia; football is over and forgotten till next fall again revives it, and boating will not engage much attention until spring brings softer breezes and milder weather.

—We are requested by the Saratoga Rowing Association to print the following card:

SARATOGA ROWING ASSOCIATION.

It is necessary for the Saratoga Rowing Association to have the address of every amateur rowing club of good standing in the United States and Canada. The Association propose to issue soon its circulars concerning its annual regatta, which will be given some time in August. Therefore it is to be hoped that all rowing clubs will send their address, giving name of President and Secretary, so that none may be overlooked, nor fail to receive circulars. Address

SARATOGA ROWING ASSOCIATION,
Saratoga Springs, New York.

Rational Pastimes.

Will our University correspondents kindly send us their most recent catalogues

—There was a grand gathering of gentlemen athletes at Wood's Gymnasium, Twenty-eighth street, on January 31st to witness a wrestling, fencing, and sparring exhibition. The gymnasium was crowded by the pupils of Professor Wood, and the members of the athletic clubs of New Jersey, Chicago, and Brooklyn, who believe in the exercising of the various muscles in order to bring themselves into a state of athletic perfection. The sparring match between Fred. J. Engelhardt, of the *Turf, Field, and Farm*, and J. E. Russell was particularly effective. Mr. Pennell's display of what a gentleman may do with judicious exercise and careful training was astonishing. He lifted, in fifteen minutes, dumb bells from 45 to 180 pounds, and finally succeeded in putting up 201 pounds. This was the most successful gathering of indoor sports that we have had this winter.

—We are gratified to learn, from personal interview with leading members of the "Athletic Club" of Philadelphia, that this pioneer of professional Base Ball clubs in the United States, is moving earnestly in the cause of reform, and that it is its earnest purpose to squelch the spirit of gambling out of the fraternity and its pastimes, and to remove any unpleasant taint that may attach itself to professional contests in the field. This ancient and honorable club have very select quarters in Philadelphia, and their rooms embrace an elegant parlor furnished with piano, paintings, &c., a billiard room and a chess room, showing that the members devote attention to the aesthetic, as well as to physical culture in the professional arena.

PRINCETON, N. J., January 26, 1874.

EDITOR FOREST AND STREAM:—

I have noticed in various sporting papers articles written in direct antagonism to the recent organization of the National Amateur Association of Base Ball players, and urging the calling of a convention of college organizations to frame a constitution and code of rules, which shall be binding upon all amateur organizations throughout the United States.

The only argument which the author has endeavored to advance, and in our mind we are very much averse to giving it the dignified name of argument, is "that a full representation of all amateur clubs cannot be had, and therefore no set of amateur organizations ought to assume the responsibility of codifying rules binding upon all other clubs without this association." If we do not organize a National Amateur Association, what are we going to do in the matter? This writer says "Why, call a convention of college clubs, wherein all may be represented, and where the best legislation may be secured." Now, the author of this lame suggestion is one who, from the experience which he has had in base ball matters certainly ought to know that in the first place no country would issue a call for a convention of that nature, and in the second that the amateur clubs throughout the United States would not subject themselves to the legislation of such a body. The point made that all amateur clubs cannot be represented in the present association, is equally unsound, for no restrictions are placed upon membership, and any and every club so desirous has the right to send, and can send delegates who may represent their special interests.

Having shown wherein the author of the article referred to has most egregiously erred in regard to non-representation, and still further, where

he has committed a double error of judgment in imagining that either any college would be so disposed to undertake his proposed measures, or that the amateur clubs would willingly submit to any such unauthorized convention to legislate for them.

However, before long there will be a convention of college clubs called, when legislation will be entered upon, which shall be binding upon college organizations only, and that for purposes effecting a national tournament of colleges to be held at Saratoga this summer on the occasion of the annual college regatta.

We think that the present Association of Base Ball players is on such a basis that articles of this nature have no deleterious effect upon it, but only go to prove that its opponents are actuated by anything but the best interests of amateur clubs.

CHAMPTON.

CURLING.

—The grand match, North vs. South, which took place at Central Park the day we went to press, viz., January 20, resulted in the success of the Southern players by a score of 416 to 317. Seventeen Rinks took part in the match, including members of the clubs of New York, Brooklyn, Paterson, Jersey City, Yonkers, &c. The Caledonian Club of this city bore off the honors and Mr. Templeton's Rink lead the score.

SOUTH.			NORTH.		
Rink.	Skip.	Shots.	Rink.	Skip.	Shots.
1. J. Templeton	36	W. Crawford	8
2. M. Baxter	22	R. Downie	32
3. R. Russell	28	A. Robertson	17
4. P. Kirkwood	21	H. L. Butler	29
5. James Nichols	28	C. McKenzie	19
6. D. Reid	33	A. Phillips	16
7. A. McKnight	9	G. Frazer	23
8. James Peacock	33	W. Brander	8
9. J. Kellock	19	John Thompson	24
10. J. Smith	33	D. Foulis	12
11. G. Cleminson	31	James Stewart	13
12. G. Grieves	29	P. Scott	21
13. A. Dalrymple	23	S. McIntyre	21
14. G. Everett	22	James Dingwall	10
15. D. Johnson	19	K. McPherson	26
16. J. Dunlop	21	J. W. Thompson	16
17. W. Hogg	9	R. A. McKnight	12
Total	416	Total	317

Mr. A. Hoagland presented the medal to Mr. J. L. Hamilton, who received it on the part of the Grand National Curling Club.

—The grand match in playing "points," which took place at the Central Park Curling Lake, on Monday, Feb. 2d., was participated in by the Caledonian, New York and Burns Clubs, of New York; the Thistle, of Brooklyn, and the Paterson Club, and the several prizes won were as follows:—

First prize, J. R. Smith, of Paterson Club, eight points.

Second prize, James Anderson, of Burns Club, seven points.

Third prize, G. T. Addison, of Caledonian Club, six points.

Referee, D. Faulis, of Caledonian Club.

—The Caledonian Club, of Brooklyn, played a match with the New York Club at Central Park on Feb. 2d., which they won by the score of 37 to 34. Two rinks on each side were played, Andrew Kellock's rink of Brooklyn, taking the lead. Mr. G. Everett acted as referee.

—The Central Park Lakes were all crowded to excess with skaters of both sexes on Feb. 2d., but at night the heavy snow storm drove all off the Lakes. There was also grand skating at the Prospect Park and Capitoline Lakes, Brooklyn, on the same day, and at the latter resort on February 3d.

BILLIARDS.

—The two great French artistes, Garnier and Ubassy, played a match game at billiards on January 30th, in Tammany Hall, for \$2,000, the champion cup, and the championship of the world at the three ball carom game. The number of points was 600. The table used was a 5 by 10 carom standard American, with Collender's combination cushion. Joe Dion acted as umpire for Ubassy, Mr. Newhall, of Boston, for Garnier; C. B. Hubbell, the ex-champion of Connecticut, was selected as referee, and Mr. G. Stone marked the game. The playing on both sides was brilliant in the extreme, but as we have before remarked, Ubassy seems just a little too sure of his shots, and the astonishment depicted on his countenance when he misses a shot is one of irritability and surprise. Both players have their admirers, and the applause at Garnier's *massés* and Ubassy's inimitable draw shots amounted to amazement. There was certainly an ebullition of feeling on the part of the auditory which must have been very gratifying to the brilliant experts. It was quite noticeable that when the audience became tired of applauding, and in order to show their surprise at the marvellous play the audience, one and all, laughed outright. The following is the score:—

GARNIER—0, 19, 2, 1, 0, 14, 30, 0, 1, 9, 1, 1, 7, 25, 0, 2, 40, 33, 3, 4, 3, 0, 0, 4, 5, 14, 1, 0, 47, 1, 0, 47, 6, 5, 3, 0, 0, 1, 0, 11, 17, 108, 7, 1, 0, 0, 17, 0, 0, 5, 22, 1, 7, 0, 0, 49, 24, 0, 11, 0, 1, 3, 23, 1, 0, 1, 19, 1—600.

UBASSY—2, 7, 0, 2, 7, 0, 30, 3, 0, 0, 7, 5, 4, 1, 0, 0, 9, 0, 2, 2, 15, 5, 0, 4, 1, 1, 6, 13, 2, 20, 24, 4, 5, 4, 1, 0, 2, 0, 21, 12, 2, 3, 10, 0, 0, 1, 0, 2, 4, 11, 0, 22, 12, 0, 9, 50, 15, 16, 7, 0, 0, 20, 35, 0, 4, 2, 13—459.

Average of winner, 8 48-69.

Time of game, three hours and twenty minutes.

—Daly & Larry's Spingler House Billiard Room has just been improved by having its tables thoroughly repaired, new cloths, cushions, balls, cues, &c. Daly, in conjunction with Dudley Kavanagh and K. E. Willmarth, will give exhibitions every Tuesday and Thursday evenings.

—Cyrille Dion and Maurice Daly have made a match at French caroms, 600 points up for \$2,000, to be played within thirty days in this city; the game will probably be played in public.

—David Pulsifer, a Boston expert, who was on here to witness the championship match, offered a purse of \$250 as an inducement to Garnier and Ubassy to give an exhibition in that city.

—A. W. Merriam, of New Orleans, has lately returned from Europe, and thoroughly refitted his room, besides adding a spacious and elegant club room to his establishment. He is one of the most enterprising men in his business in the South.

—A large number of billiard celebrities were here to witness the championship match, among whom was the veteran "Chris." Bird, of Philadelphia, his first appearance here for eleven years; Albert Garnier, champion, is anxious to match himself and Maurice Daly against any two players in the world at French billiards.

—Peter Tracy, the Stamford billiardist, was in town Friday, and reports business there flourishing.

—Cyrille Dion, Maurice Daly, Joseph Dion, Ubassy, and Garnier, will visit Philadelphia this week to give an exhibition for the benefit of E. J. Plunket, who is suffering from a paralytic stroke.

—John Deery is still in New York; A. P. Rudolph, at last accounts, in Havana.

—Maurice Daly has challenged M. Garnier. The time, date, and place will be arranged some day this week.

—American tourists are familiar with the sturdy mountaineers who act as guides over the rocky ways which divide France from Spain. *La Chasse Illustrée* tells of one of these guides, Orteig by name, who on December 21st started on foot from Pau for Paris, and arrived in Paris on the 1st of January. As the distance is 880 kilometres, or 450 miles as the crow flies, it is a good tramp. It must be remembered that for the first sixty miles it was mountain travel, that the days were short, and that by the roads it was fully 550 miles. Orteig's feat is justly worthy of mention.

The Horse and the Course.

—The Agricultural Association of La Salle, Ill., will hold a four day's race meeting on the 1st. of July, and three following days. The first two days will be trotting and the other two running. Eight thousand dollars will be given in purses for competition—\$4,000 for trotters and \$4,000 for runners.

—Harry Bassett will not be trained this year, but will be placed in the stud at Princeton, N. J., for Colonel McDaniel's exclusive service.

—The Trainers' and Drivers' Protective Association passed a set of resolutions at a late meeting as an acknowledgment of the kindness and attention shown to members of their association by the members of the different trotting associations visited by them as trainers and drivers during the season of 1873. These resolutions were addressed to Buffalo, Hampden, Beacon, Catskill, Point Breeze, Fleetwood, Prospect Park, Goshen, Plainville and Cleveland Club Park associations. The resolutions have been handsomely printed and a copy sent to each of the above trotting parks.

—The Savannah Jockey Club have been obliged to postpone the races until to-day owing to the inclement weather. Savannah is quite full of people, and the races promise to be the most successful held in the South since the war.

—The Chestnut colt Tom Aiken, four years old, by John Aiken, dam Likeness, belonging to the stables of L. A. Hitchcock, died suddenly, in Savannah, on Tuesday last. At the time Tom Aiken had been ridden around the track, when he stopped suddenly, reeled, fell to the ground and expired in less than two minutes, his rider barely alighting on the ground before the colt was down. His death was caused by congestion of the lungs.

—It is stated by the Louisville *Ledger* that R. Ten Broeck, has recently shipped six head of race horses to Europe.

—There are at present \$60,000 worth of thorough-breds on the Nashville Course under training.

In South Durham, Vermont, is to be found one of the oldest horses in the United States. This equine Methuselah is in his forty-second year, and is still lusty. Some time, years ago, we saw an English horse near St. Catharines in Canada, whose age was thirty-eight, he was as neat looking and as full of fire as a two-year-old. A list of equine longevities well authenticated, with attention paid to the kind and breed of horse, and character of work, would be not only interesting, but useful. Will some of our friends give us information in regard to this subject? In Africa, we have seen barbs of twenty and twenty-five years old, with Arabs on them, scouring the plains of Algiers, as fresh and gay as colts. In the United States we use up horse flesh too quickly.

—At a recent sale of heavy cart horses in Liverpool, the amounts realized were from \$271, the lowest price, up to \$528, the highest. The animals were from five to six years old, in fine order, and would weigh on an average 2,000 pounds each, and reach seventeen hands in height.

How to Drive.—There is a point of prime importance in driving any horse, but especially a young one; it is the way you handle the reins. Most drivers overdrive. They attempt too much; and, in so doing, distract or hamper the horse. Now and then you find a horse with such a vicious gait that his speed is got from him by the most artificial process, but such horses are fortunately rare, and hence the style of management required cannot become general. The true way is to let the horse drive himself, the driver doing little but directing him, and giving him that confidence which alone gets in himself when he feels that a guide and a friend is back of him. The most vicious and inexcusable style of driving is that which so many drivers adopt, viz., wrapping the lines around either hand, and pulling the horse backward with all their might and main,

so that the horse, in point of fact, pulls the weight back of him with his mouth, and not with his breast and shoulders. This they do under the impression that such a dead pull is needed to "steady" the horse. This method of driving I regard as radically and superlatively wrong. It would tax the ingenuity of a hundred fools to invent a worse one. The fact is, with rare exceptions there should never be any pull put upon the horse at all. A steady pressure is allowable; but anything beyond this has no justification in nature or reason; for nature suggests the utmost possible freedom of action of head, body, and limbs that the animal may attain the highest rate of speed; and reason certainly forbids the supposition that by the bits and not the breast collar the horse is to draw the weight attached to it. In speeding my horse I very seldom grasp the lines with both hands when the road is straight and free from obstructions. The lines are rarely steadily taut, but held in easy pliancy, and used chiefly to shift the bit in the animal's mouth, and by this motion communicate confidence to him. I find that by this method my horses break less and go much faster than when driven by men who put the old fashioned steady pull upon them.—*Murray's Perfect Horse.*

NEW LEGISLATION FOR THE SOCIETY FOR THE PREVENTION OF CRUELTY TO ANIMALS.—At Albany, on the 29th of last month, Mr. Wagstaff's bill conferring additional powers on the officers of the Society for the Prevention of Cruelty to Animals, was favorably received. The new additions to the former laws are as follows:

Section 3 provides that any officer, agent or member of said society may lawfully interfere to prevent the perpetration of any act of cruelty to any animal in his presence, and any person who shall interfere with, or obstruct any such officer, agent or member, in the discharge of his duty, shall be guilty of a misdemeanor.

The fourth and fifth sections are as follows:

4. Any agent or officer of said society may lawfully destroy or cause to be destroyed, any animal found abandoned and not properly cared for, appearing, in the judgment of two reputable citizens called by him to view the same in his presence, to be glandered, injured or diseased past recovery for any useful purpose.

5. When any person arrested is at the time of such arrest in charge of any vehicle drawn by or containing any animal, any agent of said society may take charge of such animal, and of such vehicle and its contents, and deposit the same in a place of safe custody, or deliver the same into the possession of the police or sheriff of the county or place wherein such arrest was made, who shall thereupon assume the custody thereof.

—We acknowledge the following polite note from the President of the Blooming Grove Park Association, and congratulate the Club upon this new and valuable accession to its Kennel. The gift of Mr. Sartori is deserving of highest appreciation:—

NEW YORK, January 30, 1874.

CHAS. HALLOCK, Esq.:

DEAR SIR—On behalf of our Club, I have just received a very valuable addition to our Kennels at the Park; a splendid pair of beagle hound pups of a rare strain, presented by Mr. John B. Sartori of Philadelphia, who is one of the Directors. This breed of hounds is specially good for white hare hunting; they are very musical and tractable, and can be trained so that they will follow nothing else.

I hope you will enjoy many a hunt listening to the music of a pack of their descendants, among the thousands of hares in which our grounds abound. Very truly yours,

F. S. GILES,

President Blooming Grove Park.

[Beagles are not fast enough to follow the white hare, nor can they trail, track or travel through snow, which is the season the hare changes his coat. The harrier, or a small breed of fox hound is the proper breed of dog for the white hare.—ED.]

New Publications.

[Publications sent to this office, treating upon subjects that come within the scope of the paper, will receive special attention. The receipt of all books delivered at our Editorial Rooms will be promptly acknowledged in the next issue. Publishers will confer a favor by promptly advising us of any omission in this respect. Prices of books inserted when desired.]

ECLECTIC EDUCATIONAL SERIES.

Among the recent new publications designed for the use of the different classes of our public schools, we notice, as worthy of especial attention, one called "The School Stage." Such a work has long been wanted. This new collection of juvenile plays for schools and home exhibitions contains twenty seven new short dialogues and plays for juveniles. It is handsomely illustrated, with full directions for stage management, properties, costumes, &c., in connection with the whole art of stage business, which makes it a desirable work for all who engage in such amusements. These plays, dramas, &c., are by W. H. Venable, and the book is furnished at the price of \$1 25. Contents unexceptionable.

GOOD MORALS AND GENTLE MANNERS. By Alex. M. Grow. A. M.

This is a work designed for the use of schools as a text book on Moral and Social Law. Price \$1 25. This work goes into the very essence of school teaching, especially upon the much neglected subjects, which will be found highly useful in every school and family. No one can fail to receive much useful information and profit from a careful reading of it.

Next we have "Thalheimer's Ancient History." A complete manual of ancient history from the very earliest times to the fall of the Western Empire. M. E. Thalheimer, formerly of the Packer Collegiate Institute, has done a good service to the cause of education. This work is the fruit of much careful research among the ancient temples and other historical objects. Illustrated with drawings and charts of the same, all of which may be relied upon as accurate delineations of the text. A complete index and pronouncing vocabulary adds to its value. As a manual, the work will, we think, be regarded as near perfect as any work of the kind before the public. The whole of the rich, glowing, highly oriental style of historic thought, of historical facts and traditions, are admirably blended in one perfect whole. We think it is a work that should have a prominent place in every town library that has an historical shelf within its niches. As a whole, concise, reliable history, we feel we do only justice to a well written work. If we were to give a strictly critical analysis of this work we might not pass over all its points without calling attention to some minor errors which, in a second edition, will doubtless be corrected.

THE PEARL OF THE ANTILLES. By A. Gallengo. Author of "Country Life in Piedmont." London: Chapman & Hall. New York: Scribner, Welford & Co. pp. 202. \$2.25.

This book is the written experience of the author while on a visit to the island of Cuba, and contains much interesting and very reliable matter concerning this pleasant locality. In this work the extent and resources of the island are spoken of. He speaks of the Cuba of years ago when in the full tide of experimental slave labor; of the form of government; of the state of society and resources of the island previous to the war for the abolition of American slavery. When we had abolished slavery and were casting about anxiously as to what we should do with our freedmen, the Spanish Antilles were in a state of quietude, left entirely to themselves, in the enjoyment of a full monopoly of its advantages and disadvantages. The author carries his readers through all the exciting topics and vicissitudes incident upon all its changes, up to the

year 1868, when the death of Isabella united the two contending factions. Of the Spanish Government he says: "One feeling, however, Spaniards and Creoles may be said to have in common, and this is hatred for the Spanish Government and its officials. The Spaniards find it for their interest to identify themselves with the Mother Country and with its rulers, so long as in their name they contrive to have both the Government and the native population at their discretion, and so long as under the name of the Spanish Crown they can manage to defy or to baffle the intimations of foreign powers, and the outcry of public opinion for negro emancipation."

THE WETHEREL AFFAIR. By J. W. De Forest. Author of "Overland," "Kate Beaumont," &c. New York: Sheldon & Co.

This is one of the class of books that will hold in quiet many of our lady readers. It is of the sensational kind of novels, yet only moderately so; it carries along with the theory of the affair not by any means an intricate plot, as any one used to this class of reading would have divined the end of the beginning before he or she had reached the middle of the book. The character of the Heir at Law is quite a natural character of many young men of the present day who, like Wetherel the heir disinherited, have a desire to be called "fast young men," and yet who like him, in after life, have not grace enough left to repent and like him become good members of society. Almost too many characters introduced makes the work somewhat profuse; yet after examining its faults—as there are certainly faults within its pages—we feel upon the whole to commend it. There are many men of to-day whom the portrait of Judge Wetherel would just suit, and so of the female characters, some of whom we love, and as soon as we know them we feel a deep interest in them. Nestora is a well drawn character. She will find in her lady readers many sympathetic friends. Of the Count Paloski we think him a very small rascal, and we are the least pleased with the etchings of his character than with any one in the book. We like the moral tone of this book—Tupper's quotations and all.

MAGAZINES.

Among the horticultural catalogues of the month we would notice with much favor "Vicks Floral Guide." To the uninitiated in the language of flowers this is the golden key, the open sesame to the whole flower world. We cannot do our lady friends and all who love the bright and beautiful flowers of earth, a better service than to recommend them to purchase this Guide. You cannot invest at a better interest a twenty-four cent stamp than to send it in a letter to Vick and see what you receive in return.

Oliver Optic's Magazine for February. Boston: Lee & Shepard.

We open this truly boys' and girls' magazine, and find it filled to overflowing with the good stories and lively chat of the month. We can only promise our young readers a treat from the following table of contents. They will know in what fields to dig for enduring treasures. We say to them, "Go dig, and be learned and wise."

"The Coming Wave," Chap. iv and v. "Your Valentines," "The Lily and the Cross," chap. v to ix. "Running to Waste," "Riderless," a poem; "The Homespun Club," "Minot's Ledge Light House," "The Camp in the Gulch," and a variety of other interesting original papers.

Durfee & Foxcraft subscription managers, 151 Washington street.

Popular Science Monthly for February. New York: D. Appleton & Co.

Among the many papers of this number particularly deserving careful attention, we would place before our readers this extract as having a direct bearing upon one of the great questions of the day: "First, as regards public Schools, I would make provision for simple instruction in the elements of Physiology and Hygiene, either by the use of some short and plain text-book, or, what is still better, by lectures from some competent resident physician. I confess that I greatly prefer the latter method. Not only theory, but experience, leads me to prefer it. Were it not that we have made a very great mistake in our systems of public instruction, by severing our common school instruction from advanced instruction, we should by this time have a body of teachers in our common schools abundantly able to lecture to the pupils without a text-book. I trust the time will come when provision will be made just as thoroughly for advanced instruction as for primary and common school instruction, when all will be connected together; when the present logical separation that exists, under which primary and common school education is provided for by the State, and advanced education is left very inadequately provided by various religious denominations, will be done away with. But at present we have comparatively few teachers in our public schools who are competent without text-books to teach a subject of this kind; therefore it is that I would have provision made, in our larger schools especially, for lectures by resident physicians. That the interest of pupils can be roused in this way I know, for I have seen it fully tried. It is one of those subjects in which, with a little care, the great body of school children can be greatly interested, and this without the slightest detriment to other subjects. The very change of method will make them come back to other subjects of study with renewed vigor."

ANNOUNCEMENTS.

THE DEBATABLE LAND, Between this World and the Next. By Robert Dale Owen.

A book for the scholar, the sceptic, the believer, the scientist and the novel reader. A book denounced by the *Catholic World* as leading to the devil, and praised by the *Independent* as leading to a greater faith, reverence and love of Christianity. New York: G. W. Carleton & Co.

MODERN OMBRE. Boston: A. Williams & Co. have just published an old Spanish game under this title, with full rules and directions for playing the same, both for beginners and the more advanced players. It is said to be "very good indeed;" how good that is we will tell you when we have read it.

SCHEM'S STATISTICS OF THE WORLD. We have received from the publisher, G. J. Moulton, of 103 Fulton street, the work with the above title, where may be found in convenient form the various statistical points in regard to all countries, so necessary for the literary man or the student, and which take up so much time to find, compressed in a single volume. The book in neat form is a very perfect statistical compendium, and will be found most useful.

GEOLOGICAL STORIES. A series of autobiographies in chronological order, by J. E. Taylor, F. L. S., F. G. S. Illustrated. New York: G. P. Putnam's Sons. 1874.

THEORY AND PRACTICE OF NAVIGATION. By Henry Evers, L.L.D. New York: G. P. Putnam's Sons. 1874.

HALF HOURS WITH THE MICROSCOPE. Being a popular guide to the use of the microscope as a means of amusement and study. Illustrated. Edwin Lankester, M. D. New York: Putnam's Sons. 1874.

—Pedro C. Armijo, or Pete Armijo, as he was better known to his numerous American friends, the well-known sheep-king of Albuquerque, New Mexico, committed suicide by shooting himself on Jan. 7th, the cause, it is said, being a disappointment in love.

—Sleep obtained two hours before midnight, when the negative forces are in operation, is the rest which most recuperates the system.

—Naukatuck is the only town in Connecticut bearing an Indian name.

Vanity Fair
Cut Cavendish Smoking,
Ask your Dealer, or send direct to our
works for a supply of PURE Tobacco.

VIENNA, AUSTRIA, Nov. 30, 1873.
Messrs. Wm. S. Kimball & Co.:

Sirs—A friend of mine sent me, with a transport
of Indian Skulls, two pounds of "Vanity Fair," which I declare
to be the best Tobacco I ever smoked. We have very good
tobacco in Vienna—Turkish and Hungarian, but "Vanity Fair"
is the King of all, by its aromatic flavor and the right sort of
strength. My friend in New York got an appointment in
California, by that reason I apply immediately to you, begging
you to send me for the enclosed ten dollars, a supply of "Vanity
Fair," and send with the next steamer to Germany. If there
is a German firm that sells your excellent "Vanity Fair," I
beg you to enclose me the address.

Dr. Jos. Hyrtl.

Professor of Anatomy in the University of Vienna.

TO SPORTSMEN.
CHAMPION POINTER
"BELLE."

The artistic portrait of this REMARKABLE
ANIMAL, the champion field dog of England has

Sportsmen's Goods.

This Rifle, after being tested in the severest manner by the late Board of U. S. Officers, appointed by the Government to select the best arm for the service; and after examining over one hundred different systems, including the best guns of Europe, say of it, "that it is the best rifle they have seen, or of which they have any knowledge. They therefore recommend it for trial in the hands of the troops. A seven pound carbine on this plan, with coarse military sights, has made better targets at Creedmoor the past summer, than the best English and American target rifles weighing 10 pounds and having peep and globe sights.

We are now making these guns to supply the numerous demands, and will soon have them in the market.

The following is our scale of prices:—
SPECIAL MAGAZINE RIFLE for large game, carrying from 3 to 8 cartridges, 70 to 85 grs. of powder, 350 to 400 grs. of lead, 8 to 10 lbs. weight, \$60.00 and upwards, according to finish.

SPECIAL LONG RANGE MAGAZINE RIFLE for Creedmoor shooting, 90 grs. of powder, 480 grs. of lead, carrying 3 to 8 charges, weight, 10 lbs. from \$100 and upwards.

MAGAZINE RIFLES for general use. Carry 3 to 9 cartridges, 60 grs. powder, 350 grs. lead from \$40.00 and upwards.

SINGLE BREECH LOADERS for long range Creedmoor shooting, 90 grs. powder; lead, 480 grs. from \$60.00 and upwards.

SINGLE BREECH LOADERS for general use, 6 to 7 lbs., 60 grs. powder, 350 grs. lead, from \$30.00 and upwards.

The calibre of all our rifles, unless otherwise ordered, will be .45-100.

All communications should be addressed to
BETHEL BURTON,

Breech-Loading
Rifles and Shot Guns.

Long Range Match Rifles for "Creedmoor" Shooting, now ready. The same as won the "Turf, Field and Farm" Badge, Aug. 2, and "Amateur Rifle Club" Badge, Aug. 9. See reports. Unequalled for accuracy by either Breech or Muzzle-Loaders of other makers.

For simplicity of mechanism, ease of manipulation, quality of workmanship and material, accuracy of range, and penetration, WITHOUT COMPARISON.

"It is a noteworthy fact that though many different kinds of rifles were used in the several matches, including the converted Springfield, Remington, Metford, Ballard and Ward Burton Rifle, every prize in all the matches was won by those who fired with the Remington rifle, except the last."—From N. Y. Times, June 22, 1873.—(See full report.)

The Remington Rifle won Twenty-two out of Twenty-three Prizes at the Creedmoor Meeting, June 21, 1873.
